 return joinTo(StringBuilder(), separator, prefix, postfix, limit, truncated, transform).toString()
}

Creates a string from all the elements separated using [separator] and using the given [prefix] and [postfix] if supplied.
If the collection could be huge, you can specify a non-negative value of [limit], in which case only the first [limit] elements will be

```

appended, followed by the [truncated] string (which defaults to "...").

Visibility is an aspect of a Kotlin declaration regulating where that declaration is accessible in the source code. Visibility can be changed with one of the following modifiers: `public`, `protected`, `internal`, `private`. Note that some Java visibilities such as package-private and protected (which also gives access to items from the same package) cannot be represented in Kotlin, so there's no [KVisibility] value corresponding to them. See the [Kotlin language documentation](https://kotlinlang.org/docs/reference/visibility-modifiers.html) for more information.

```

@SinceKotlin("1.1")
enum class KVisibility {
 /**
 * Visibility of declarations marked with the `public` modifier, or with no modifier at all.

 /**
 * Visibility of declarations marked with the `protected` modifier.

a class) specific name in JavaScript.\n *\n * This may be useful in the following cases:\n *\n * * There are two
functions for which the compiler gives same name in JavaScript, you can\n * mark one with `@JsName(...)` to
prevent the compiler from reporting error.\n *\n * * You are writing a JavaScript library in Kotlin. The compiler
produces mangled names\n * for functions with parameters, which is unnatural for usual JavaScript developer.\n *
\n * You can put `@JsName(...)` on functions you want to be available from JavaScript.\n *\n * * For some reason you
want to rename declaration, e.g. there's common term in JavaScript\n * for a concept provided by the declaration,
which is uncommon in Kotlin.\n *\n * Example:\n *\n * ``` kotlin\n * class Person(val name: String) {\n * fun

```

```

hello() {
 println("Hello $name!")
}

@JsName("helloWithGreeting") fun
hello(greeting: String) {
 println("$greeting $name!")
}

// // Denotes an `external` declaration that must be imported
// // from native JavaScript library.
// // The compiler produces the code relevant for the target module system, for
// // example, in case of CommonJS, it will import the declaration via the `require(...)`
// // function.
// // The
// // annotation can be used on top-level external declarations (classes, properties,
// // functions) and files.
// // In case of file
// // (which can't be `external`) the following rule applies: all the declarations in
// // the file must be `external`. By
// // applying `@JsModule(...)` on a file you tell the compiler to import a
// // JavaScript object that contain all the
// // declarations from the file.
// // Example:
// // ```kotlin
// // @JsModule("jquery")
// // external abstract class
// // JQuery() {
// // // some declarations here
// // }
// // @JsModule("jquery")
// // external fun JQuery(element:
// // Element): JQuery
// // ```
// // @property import name of a module to import declaration from.
// // It is not
// // interpreted by the Kotlin compiler, it's passed as is directly to the target
// // module system.
// // @see
// JsNonModule

// // // However, by applying [JsModule] annotation you can make a declaration
// // // unavailable to *plain* module
// // // system.
// // // Some JavaScript libraries are distributed both as a standalone

// // // module available
// // // as an npm package.
// // // To tell the Kotlin compiler to accept both cases, you can augment
// // // [JsModule] with the `@JsNonModule` annotation.
// // // For example:

// // // @JsModule("jquery")
// // // @JsNonModule
