produces a duration value that doesn't fit into the above range, the returned `Duration` is infinite. An infinite duration value [Duration.INFINITE] can be used to represent infinite timeouts. To construct a duration use either the extension function [toDuration], or the extension properties [hours], [minutes], [seconds], and so on, available on [Int], [Long], and [Double] numeric types. To get the value of this duration expressed in a particular [duration units][DurationUnit] use the functions [toInt], [toLong], and [toDouble] or the properties [inWholeHours], [inWholeMinutes], [inWholeSeconds], [inWholeNanoseconds], and so on.

Returns a sequence containing all elements of the original sequence and then the given [element].

The operation is _intermediate_ and _stateless_.

public operator fun <T> Sequence<T>.plus(element: T): Sequence<T> {
    return sequenceOf(this, sequenceOf(element)).flatten()
}

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] array.

Note that the source sequence and the array being added are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is _intermediate_ and _stateless_.

public operator fun <T> Sequence<T>.plus(elements: Array<out T>): Sequence<T> {
    return this.plus(elements.asList())
}

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] collection.

Note that the source sequence and the collection being added are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is _intermediate_ and _stateless_.

public operator fun <T> Sequence<T>.plus(elements: Iterable<T>): Sequence<T> {
    return sequenceOf(this, elements.asSequence()).flatten()

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] sequence.

Note that the source sequence and the sequence being added are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is _intermediate_ and _stateless_.

public operator fun <T> Sequence<T>.plus(elements: Sequence<T>): Sequence<T> {

The operation is _intermediate_ and _stateless_.

@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.plusElement(element: T): Sequence<T> {
    return plus(element)
}

Returns a sequence of snapshots of the window of the given [size] sliding along this sequence with the given [step], where each snapshot is a list.

Several last lists may have fewer elements than the given [size].

Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

@param size the number of elements to take in each window
@param step the number of elements to move the window forward by on an each step, by default 1
@param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

@sample samples.collections.Sequences.Transformations.takeWindows

public fun <T> Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false): Sequence<List<T>> {
    return windowedSequence(size, step, partialWindows, reuseBuffer = false)
}

Returns a sequence of results of applying the given [transform] function to an each list representing a view over the window of the given [size] sliding along this sequence with the given [step].

Note that the list passed to the [transform] function is ephemeral and is valid only inside that function.

You should not store it or allow it to escape in some way, unless you made a snapshot of it.

Several last lists may have fewer elements than the given [size].

Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

@param size the number of elements to take in each window
@param step the number of elements to move the window forward by on an each step, by default 1

 * \n/** Gives a declaration (a function, a property or a class) specific name in
 * JavaScript.
 *
 * This may be useful in the following cases:
 *
 * * There are two functions for which the
 * compiler gives same name in JavaScript, you can
 * mark one with `@JsName(...)` to prevent the compiler from
 * reporting error.
 *
 * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names
 * for functions with parameters, which is unnatural for usual JavaScript developer.
 *
 * You can put `@JsName(...)`
 * on functions you want to be available from JavaScript.
 *
 * * For some reason you want to rename declaration, e.g.
 * there's common term in JavaScript
 * for a concept provided by the declaration, which is uncommon in Kotlin.
 *
 * Example:
 *
 * ``` kotlin
 * class Person(val name: String) {
 *     fun hello() {
 *         println("Hello
 * $name!")
 *     }
 *     @JsName("helloWithGreeting")
 *     fun hello(greeting: String) {
 *         println("$greeting $name!")
 *     }
 * }
 *
 * @property name the name which compiler uses both for
 * declaration itself and for all references to the declaration.
 *
 * It's required to denote a valid JavaScript
 * identifier.
 *
 * \n@Retention(AnnotationRetention.BINARY)
 * \n@Target(CLASS, FUNCTION, PROPERTY,
 * CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)
 * public actual annotation class JsName(actual
 * val name: String)
 * \n/** Denotes an `external` declaration that must be imported from native JavaScript
 * library.
 *
 * The compiler produces the code relevant for the target module system, for example, in case of
 * CommonJS,
 * it will import the declaration via the `require(...)` function.
 *
 * The annotation can be used on
 * top-level external declarations (classes, properties, functions) and files.
 *
 * In case of file (which can't be `external`)
 * the following rule applies: all the declarations in
 * the file must be `external`. By applying `@JsModule(...)` on a

```

file you tell the compiler to import a JavaScript object that contain all the declarations from the file.

Example:

```

kotlin @JsModule("jquery") external abstract class JQuery() {
    // some declarations here
}
kotlin @JsModule("jquery") external fun JQuery(element: Element): JQuery
@property import name of a module to import declaration from. It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.
@see JsNonModule
@Retention(AnnotationRetention.BINARY) @Target(CLASS, PROPERTY, FUNCTION, FILE) public annotation class JsModule(val import: String) {
    Denotes an `external` declaration that can be used without module system.
    By default, an `external` declaration is available regardless your target module system.
    However, by applying [JsModule] annotation you can make a declaration unavailable to `plain` module system.
    Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available as an npm package.
    To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.
    For example:
kotlin @JsModule("jquery") @JsNonModule @JsName("$") external abstract class JQuery() {
    // some declarations here
}
kotlin @JsModule("jquery") @JsNonModule @JsName("$") external fun JQuery(element: Element): JQuery
@see JsModule
@Retention(AnnotationRetention.BINARY) @Target(CLASS, PROPERTY, FUNCTION, FILE) public annotation class JsNonModule {
    Adds prefix to `external` declarations in a source file.
    JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.
    The compiler turns references to `external` declarations either to plain unprefix names (in case of `plain` modules) or to plain imports.
    However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this.
    You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation.
    Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.
    Example:
kotlin @file:JsQualifier("my.jsPackageName") package some.kotlinPackage external fun foo(x: Int)
kotlin external fun bar(): String
@property value the qualifier to add to the declarations in the generated code.
    It must be a sequence of valid JavaScript identifiers separated by the `.` character.
    Examples of valid qualifiers are: `foo`, `bar.Baz`, `_.$.f`.
@see JsModule
@Retention(AnnotationRetention.BINARY) @Target(AnnotationTarget.FILE) public annotation class JsQualifier(val value: String) {
    Exports top-level declaration on JS platform.
    Compiled module exposes declarations that are marked with this annotation without name mangling.
    This annotation can be applied to either files or top-level declarations.
    It is currently prohibited to export the following kinds of declarations:
    * `expect` declarations
    * inline functions with reified type parameters
    * suspend functions
    * secondary constructors without `@JsName`
    * extension properties
    * enum classes
    * annotation classes
    Signatures of exported declarations must only contain `exportable` types:
    * `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`, `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
    * `Array<exportable-type>`
    * Function types with exportable parameters and return types
    * `external` or `@JsExport` classes and interfaces
    * Nullable counterparts of types above
    * Unit return type. Must not be nullable
    This annotation is experimental, meaning that restrictions mentioned above are subject to change.
