

Dial-peer Based Recording

- [Dial-peer Based Recording, on page 1](#)
- [Restrictions, on page 5](#)
- [Configure Dial-peer Recording, on page 6](#)
- [Additional References for Network-Based Recording, on page 26](#)

Dial-peer Based Recording

The Dial-peer Based Recording feature supports software-based forking for Real-time Transport Protocol (RTP) streams. Media forking provides the ability to create midcall multiple streams (or branches) of audio and video associated with a single call and then send the streams of data to different destinations. To enable network-based recording using Cisco Unified Border Element (CUBE), you can configure specific commands or use a call agent. CUBE acts as a recording client and MediaSense Session Initiation Protocol (SIP) recorder acts as a recording server.

Feature Information

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Network-Based Recording

| Feature Name | Releases | Feature Information |
|---|---|---|
| Security Readiness Criteria (SRC)—Modified the command show sip-ua calls . | Cisco IOS XE Gibraltar Release 16.11.1a | Command show sip-ua calls is modified to display local crypto key and remote crypto key. |

Deployment Scenarios for CUBE-based Recording

CUBE as a recording client has the following functions:

- Acts as a SIP user agent and sets up a recording session (SIP dialog) with the recording server.

- Acts as the source of the recorded media and forwards the recorded media to the recording server.
- Sends information to a server that helps the recording server associate the call with media streams and identifies the participants of the call. This information sent to the recording server is called metadata.

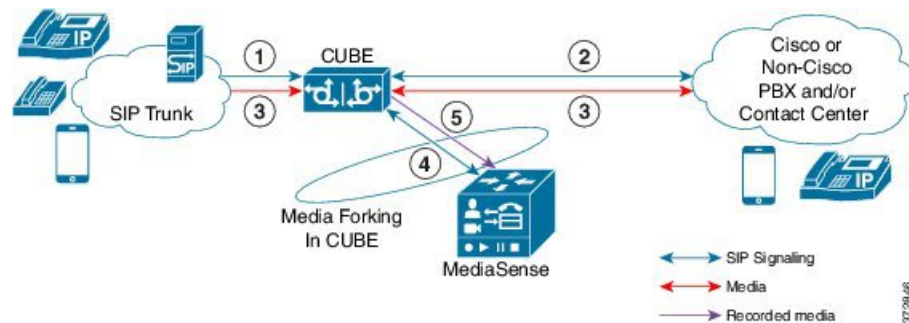

Note CUBE simply forwards the RTP streams it receives to the SIP recorder. It does not support omitting any pre-agent VRU activity from the recording.

If you want to omit the VRU segment from a recording, you must use the Unified CVP to route the agent segment of the call back through CUBE. To do this, you need to separate ingress and media forking function from one another, which means you must either route the call through the ingress router a second time, or route it through a second router.

Given below is a typical deployment scenario of a CUBE-based recording solution. The information flow is described below:

Figure 1: Deployment Scenario for CUBE-based Recording Solution

1. Incoming call from SIP trunk.
2. Outbound call to a Contact Centre
3. Media between endpoints flowthrough CUBE
4. CUBE sets up a new SIP session with MediaSense based on policy.
5. CUBE forks RTP media to MediaSense. For an audio call, audio is forked. For a video call, both audio and video are .forked. For an audio-only configuration in a audio-video call, only audio is forked. There will be two or four m-lines to the recording server, based on the type of recording

The metadata carried in the SIP session between the recording client and the recording server is to:

- Carry the communication session data that describes the call.
- Send the metadata to the recording server. The recording server uses the metadata to associate communication sessions involving two or more participants with media streams.

The call leg that is created between the recording client and the recording server is known as the recording session.

Open Recording Architecture

The Open Recording Architecture (ORA) comprises of elements, such as application management server and SIP bridge, to support IP-based recording. The ORA IP enables recording by solving topology issues, which accelerates the adoption of Cisco unified communication solutions.

Following are the three layers of the ORA architecture:

Network Layer

The ORA network layer is comprised of call control systems, media sources, and IP foundation components, such as routers and switches.

Capture and Media Processing Layer

The ORA capture and media processing layer includes core functions of ORA—terminating media streams, storage of media and metadata, and speech analytics that can provide real-time events for applications.

Application Layer

The ORA application layer supports in-call and post-call applications through open programming interfaces.

In-call applications include applications that make real-time business decisions (for example, whether to record a particular call or not), control pause and resume from Interactive Voice Response (IVR) or agent desktop systems, and perform metadata tagging and encryption key exchange at the call setup.

Post-call applications include the following:

- Traditional compliance search, replay, and quality monitoring.
- Advanced capabilities, such as speech analytics, transcription, and phonetic search.
- Custom enterprise integration.
- Enterprise-wide policy management.

Media Forking Topologies

The following topologies support media forking:

Media Forking with Cisco UCM

The figure below illustrates media forking with Cisco Unified CallManager (Cisco UCM) topology. This topology supports replication of media packets to allow recording by the caller agent. It also enables CUBE to establish full-duplex communication with the recording server. In this topology, SIP recording trunk is enhanced to have additional call metadata.

Media Forking without Cisco UCM

The topology below shows media forking without the Cisco UCM topology. This topology supports static configuration on CUBE and the replication of media packets to allow recording caller-agent and full-duplex interactions at an IP call recording server.

SIP Recorder Interface

SIP is used as a protocol between CUBE and the MediaSense SIP server. Extensions are made to SIP to carry the recording session information needed for the recording server. This information carried in SIP sessions between the recording client and the recording server is called metadata.

Metadata

Metadata is the information that is passed by the recording client to the recording server in a SIP session. Metadata describes the communication session and its media streams.

Metadata is used by the recording server to:

- Identify participants of the call.
- Associate media streams with the participant information. Each participant can have one or more media streams, such as audio and video.
- Identify the participant change due to transfers during the call.

The recording server uses the metadata information along with other SIP message information, such as dialog ID and time and date header, to derive a unique key. The recording server uses this key to store media streams and associate the participant information with the media streams.

Restrictions

- Dial-peer recording is not supported for the following calls:
 - Flow-around calls
 - Session Description Protocol (SDP) pass-through calls
 - Real-time Transport Protocol (RTP) loopback calls
 - High-density transcoder calls
 - IPv6-to-IPv6 calls
 - IPv6-to-IPv4 calls with IPv4 endpoint.
 - Secure Real-time Transport Protocol (SRTP) passthrough calls
 - SRTP-RTP calls with forking for SRTP leg (forking is supported for the RTP leg)
 - Resource Reservation Protocol (RSVP)
 - Multicast music on hold (MOH)
- Any media service parameter change via Re-INVITE or UPDATE from Recording server is not supported. Midcall renegotiation and supplementary services can be done through the primary call only.
- Recording is not supported if CUBE is running a TCL IVR application with the exception of survivability.tcl, which is supported with network based recording.
- Media mixing on forked streams is not supported

- Digital Signal Processing (DSP) resources are not supported on forked legs
- RecordTone insertion is not supported with SRTP calls.
- MediaForkingReason tag is to notify midcall stream events. Notification for codec change is not supported.

Restrictions for Video Recording

- If the main call has multiple video streams (m-lines), the video streams other than the first video m-line are not forked.
- Application media streams of the primary call are not forked to the recording server.
- Forking is not supported if the anchor leg or recording server is on IPv6.
- High availability is not supported on forked video calls.
- Server Groups in outbound dial-peers towards recorders is not supported.

Configure Dial-peer Recording

Configure Dial-peer Recording (with Media Profile Recorder)

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **media profile recorder** *profile-tag*
4. (Optional) **media-type** **audio**
5. **media-recording** *dial-peer-tag* [*dial-peer-tag2...dial-peer-tag5*]
6. **exit**
7. **media class** *tag*
8. **recorder profile** *tag*
9. **exit**
10. **dial-peer voice** *dummy-recorder-dial-peer-tag* **voip**
11. **media-class** *tag*
12. **destination-pattern** **[+]** *string* **[T]**
13. **session protocol** **sipv2**
14. **session target** **ipv4:***[recording-server-destination-address | recording-server-dns]*
15. **session transport** **tcp**
16. **end**

DETAILED STEPS

| | Command or Action | Purpose |
|--------|-------------------|-------------------------------|
| Step 1 | enable | Enables privileged EXEC mode. |

| | Command or Action | Purpose |
|----------------|---|---|
| | Example: Device> enable | <ul style="list-style-type: none"> • Enter your password if prompted. |
| Step 2 | configure terminal Example: Device# configure terminal | Enters global configuration mode. |
| Step 3 | media profile recorder profile-tag Example: Device(config)# media profile recorder 100 | Configures the media profile recorder and enters media profile configuration mode. |
| Step 4 | (Optional) media-type audio Example: Device(cfg-mediaprofile)# media-type audio | Configures recording of audio only in a call with both audio and video. If this configuration is not done, both audio and video are recorded. |
| Step 5 | media-recording dial-peer-tag [dial-peer-tag2...dial-peer-tag5] Example: Device(cfg-mediaprofile)# media-recording 8000 8001 8002 | Configures the dial-peers that need to be configured. Note You can specify a maximum of five dial-peer tags. |
| Step 6 | exit Example: Device(cfg-mediaprofile)# exit | Exits media profile configuration mode. |
| Step 7 | media class tag Example: Device(config)# media class 100 | Configures a media class and enters media class configuration mode. |
| Step 8 | recorder profile tag Example: Device(cfg-mediaclass)# recorder profile 100 | Configures the media profile recorder. |
| Step 9 | exit Example: Device(cfg-mediaclass)# exit | Exits media class configuration mode. |
| Step 10 | dial-peer voice dummy-recorder-dial-peer-tag voip Example: | Configures a recorder dial peer and enters dial peer voice configuration mode. |

| | Command or Action | Purpose |
|----------------|---|---|
| | Device(config)# dial-peer voice 8000 voip | |
| Step 11 | media-class tag Example: Device(config-dial-peer)# media-class 100 | Configures media class on a dial peer. |
| Step 12 | destination-pattern [+ string [T] Example: Device(config-dial-peer)# destination-pattern 595959 | Specifies either the prefix or the full E.164 telephone number (depending on your dial plan) to be used for a dial peer. Note The predefined valid entries for <i>string</i> are the digits 0 to 9, the letters A to F and, the following special characters: <ul style="list-style-type: none"> • The asterisk (*) and pound sign (#) that appear on standard touch-tone dial pads. • Plus sign (+), which indicates that the preceding digit occurred one or more times. • Backslash symbol (\), which is followed by a single character, and matches that character. Media Forking functionality does not work with the wildcard entries other than the predefined set. |
| Step 13 | session protocol sipv2 Example: Device(config-dial-peer)# session protocol sipv2 | Configures the VoIP dial peer to use Session Initiation Protocol (SIP). |
| Step 14 | session target ipv4:[recording-server-destination-address recording-server-dns] Example: Device(config-dial-peer)# session target ipv4:10.42.29.7 | Specifies a network-specific address for a dial peer. Keyword and argument are as follows: <ul style="list-style-type: none"> • ipv4: <i>destination address</i> --IP address of the dial peer, in this format: <i>xxx.xxx.xxx.xxx</i> |
| Step 15 | session transport tcp Example: Device(config-dial-peer)# session transport tcp | Configures a VoIP dial peer to use Transmission Control Protocol (TCP). |
| Step 16 | end Example: | Returns to privileged EXEC mode. |

| | Command or Action | Purpose |
|--|-------------------------------|---------|
| | Device(config-dial-peer)# end | |

Configure Dial-peer Recording (without Media Profile Recorder)

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **media class tag**
4. **recorder parameter**
5. (Optional) **media-type audio**
6. **media-recording dial-peer-tag**
7. **exit**
8. **exit**
9. **dial-peer voice dummy-recorder-dial-peer-tag voip**
10. **media-class tag**
11. **destination-pattern [+] string [T]**
12. **session protocol sipv2**
13. **session target ipv4:[recording-server-destination-address | recording-server-dns]**
14. **session transport tcp**
15. **end**

DETAILED STEPS

| | Command or Action | Purpose |
|---------------|--|--|
| Step 1 | enable Example: Device> enable | Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted. |
| Step 2 | configure terminal Example: Device# configure terminal | Enters global configuration mode. |
| Step 3 | media class tag Example: Device(config)# media class 100 | Configures the media class and enters media class configuration mode. |
| Step 4 | recorder parameter Example: Device(cfg-mediaclass)# recorder parameter | Enters media class recorder parameter configuration mode to enable you to configure recorder-specific parameters. |

| | Command or Action | Purpose |
|----------------|--|--|
| Step 5 | (Optional) media-type audio Example: Device(cfg-mediaprofile)# media-type audio | Configures recording of audio only in a call with both audio and video. Note If this configuration is not done, both audio and video are recorded. |
| Step 6 | media-recording dial-peer-tag Example: Device(cfg-mediaclass-recorder)# media-recording 8000, 8001, 8002 | Configures voice-class recording parameters. Note You can specify a maximum of five dial-peer tags. |
| Step 7 | exit Example: Device(cfg-mediaclass-recorder)# exit | Exits media class recorder parameter configuration mode. |
| Step 8 | exit Example: Device(cfg-mediaclass)# exit | Exits media class configuration mode. |
| Step 9 | dial-peer voice dummy-recorder-dial-peer-tag voip Example: Device(config)# dial-peer voice 8000 voip | Configures a recorder dial peer and enters dial peer voice configuration mode. |
| Step 10 | media-class tag Example: Device(config-dial-peer)# media-class 100 | Configures media class on a dial peer. |
| Step 11 | destination-pattern [+] string [T] Example: Device(config-dial-peer)# destination-pattern 595959 | Specifies either the prefix or the full E.164 telephone number (depending on your dial plan) to be used for a dial peer. |

| | Command or Action | Purpose |
|----------------|---|--|
| | | <p>Note</p> <p>The predefined valid entries for <i>string</i> are the digits 0 to 9, the letters A to F and, the following special characters:</p> <ul style="list-style-type: none"> • The asterisk (*) and pound sign (#) that appear on standard touch-tone dial pads. • Plus sign (+), which indicates that the preceding digit occurred one or more times. • Backslash symbol (\), which is followed by a single character, and matches that character. <p>Media Forking functionality does not work with the wildcard entries other than the predefined set.</p> |
| Step 12 | <p>session protocol sipv2</p> <p>Example:</p> <pre>Device(config-dial-peer)# session protocol sipv2</pre> | Configures the VoIP dial peer to use Session Initiation Protocol (SIP). |
| Step 13 | <p>session target</p> <p>ipv4:<i>[recording-server-destination-address recording-server-dns]</i></p> <p>Example:</p> <pre>Device(config-dial-peer)# session target ipv4:10.42.29.7</pre> | <p>Specifies a network-specific address for a dial peer. Keyword and argument are as follows:</p> <ul style="list-style-type: none"> • ipv4: <i>destination address</i> --IP address of the dial peer, in this format: <i>xxx.xxx.xxx.xxx</i> |
| Step 14 | <p>session transport tcp</p> <p>Example:</p> <pre>Device(config-dial-peer)# session transport tcp</pre> | Configures a VoIP dial peer to use Transmission Control Protocol (TCP). |
| Step 15 | <p>end</p> <p>Example:</p> <pre>Device(config-dial-peer)# end</pre> | Returns to privileged EXEC mode. |

Verifying the Dial-peer Recording

Perform this task to verify the configuration of the Network-Based Recording Using CUBE. The **show** and **debug** commands can be entered in any order.

SUMMARY STEPS

1. **enable**

2. **show voip rtp connections**
3. **show voip recmsp session**
4. **show voip recmsp session detail call-id** *call-id*
5. **show voip rtp forking**
6. **show call active voice compact**
7. **show call active video compact**
8. **show sip-ua calls**
9. **show call active video brief**
10. **debug ccsip messages** (for audio calls)
11. **debug ccsip messages** (for video calls)
12. **debug ccsip messages** (for audio-only recording in a call with both audio and video)
13. Enter one of the following:
 - **debug ccsip all**
 - **debug voip recmsp all**
 - **debug voip ccapi all**
 - **debug voip fpi all** (for ASR devices only)

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

Example:

```
Device> enable
```

Step 2 show voip rtp connections

Displays Real-Time Transport Protocol (RTP) connections. Two extra connections are displayed for forked legs.

Example:

```
Device# show voip rtp connections
```

```
VoIP RTP Port Usage Information:
```

```
Max Ports Available: 8091, Ports Reserved: 101, Ports in Use: 8
```

```
Port range not configured, Min: 16384, Max: 32767
```

| Media-Address Range | Ports Available | Ports Reserved | Ports In-use |
|-----------------------|-----------------|----------------|--------------|
| Default Address-Range | 8091 | 101 | 8 |

```
VoIP RTP active connections :
```

| No. | CallId | dstCallId | LocalRTP | RmtRTP | LocalIP | RemoteIP |
|-----|--------|-----------|----------|--------|---------------|-------------|
| 1 | 1 | 2 | 16384 | 20918 | 10.104.45.191 | 10.104.8.94 |
| 2 | 2 | 1 | 16386 | 17412 | 10.104.45.191 | 10.104.8.98 |
| 3 | 3 | 4 | 16388 | 29652 | 10.104.45.191 | 10.104.8.98 |
| 4 | 4 | 3 | 16390 | 20036 | 10.104.45.191 | 10.104.8.94 |

```

5      6      5      16392  58368  10.104.45.191      10.104.105.232
6      7      5      16394  53828  10.104.45.191      10.104.105.232
7      8      5      16396  39318  10.104.45.191      10.104.105.232
8      9      5      16398  41114  10.104.45.191      10.104.105.232

```

Found 8 active RTP connections

Step 3 **show voip recmsp session**

Displays active recording Media Service Provider (MSP) session information internal to CUBE.

Example:

```
Device# show voip recmsp session
```

```
REC MSP active sessions:
```

```

MSP Call-ID      AnchorLeg Call-ID      ForkedLeg Call-ID
143              141                    145

```

```
Found 1 active sessions
```

Step 4 **show voip recmsp session detail call-id *call-id***

Displays detailed information about the recording MSP Call ID.

Example:

```
Device# show voip recmsp session detail call-id 145
```

```
REC MSP active sessions:
```

```
Detailed Information
```

```
=====
```

```
Recording MSP Leg Details:
```

```
Call ID: 143
```

```
GUID : 7C5946D38ECD
```

```
AnchorLeg Details:
```

```
Call ID: 141
```

```
Forking Stream type: voice-nearend
```

```
Participant: 708090
```

```
Non-anchor Leg Details:
```

```
Call ID: 140
```

```

Stream State ACTIVE
Voice Far End stream CallID 7
Stream State ACTIVE
Video Near End stream CallID 8
Stream State ACTIVE
Video Far End stream CallID 9
Stream State ACTIVE
Found 1 active sessions
```

| Output Field | Description |
|--------------------|--|
| Stream State | Displays the state of the call. This can be ACTIVE or HOLD. |
| Msp Call-Id | Displays an internal Media service provider call ID and forking related statistics for an active forked call. |
| Anchor Leg Call-id | Displays an internal anchor leg ID, which is the dial peer where forking enabled. The output displays the participant number and stream type. Stream type voice-near end indicates the called party side. |
| Non-Anchor Call-id | Displays an internal non-anchor leg ID, which is the dial peer where forking is not enabled. The output displays the participant number and stream type. Stream type voice-near end indicates the called party side. |
| Forked Call-id | This forking leg call-id will show near-end and far-end stream call-id details with state of the Stream . Displays an internal foked leg ID. The output displays near-end and far-end details of a stream. |

Step 5 show voip rtp forking

Displays RTP media-forking connections.

Example:

```
Device# show voip rtp forking
VoIP RTP active forks :
Fork 1
  stream type voice-only (0): count 0
  stream type voice+dtmf (1): count 0
  stream type dtmf-only (2): count 0
  stream type voice-nearend (3): count 1
    remote ip 10.42.29.7, remote port 38526, local port 18648
    codec g711ulaw, logical ssrc 0x53
```

```

    packets sent 29687, packets received 0
    stream type voice+dtmf-nearend (4): count 0
    stream type voice-farend (5): count 1
    remote ip 10.42.29.7, remote port 50482, local port 17780
    codec g711ulaw, logical ssrc 0x55
    packets sent 29686, packets received 0
    stream type voice+dtmf-farend (6): count 0
    stream type video (7): count

```

| Output Field | Description |
|---|---|
| remote ip 10.42.29.7, remote port 38526, local port 18648 | Recording server IP, recording server port, and local CUBE device port where data for stream 1 was first sent from. |
| remote ip 10.42.29.7, remote port 50482, local port 17780 | Recording server IP, recording server port, and local CUBE device port where data for stream 2 was first sent from. |
| packets sent 29686 | Number of packets sent to the recorder |
| codec g711ulaw | Codec negotiated for the recording leg. |

Step 6 show call active voice compact

Displays a compact version of voice calls in progress. An additional call leg is displayed for media forking.

Example:

```

Device# show call active voice compact
<callID> A/O FAX T<sec> Codec      type      Peer Address      IP R<ip>:<udp>
Total call-legs: 3
    140 ANS      T644   g711ulaw   VOIP      P10000           10.42.30.32:18638
    141 ORG      T644   g711ulaw   VOIP      P708090          10.42.30.189:26184
    145 ORG      T643   g711ulaw   VOIP      P595959          10.42.29.7:38526

```

Step 7 show call active video compact

Displays a compact version of video calls in progress.

Example:

```

Device# show call active video compact
<callID> A/O FAX T<sec> Codec      type      Peer Address      IP R<ip>:<udp>
Total call-legs: 3
    1 ANS      T14    H264       VOIP-VIDEO P1777          10.104.8.94:20036
    2 ORG      T14    H264       VOIP-VIDEO P1888          10.104.8.98:29652
    6 ORG      T13    H264       VOIP-VIDEO P1234          10.104.105.232:39318

```

Step 8 show sip-ua calls

Displays active user agent client (UAC) and user agent server (UAS) information on SIP calls.

Example:

```

Device# show sip-ua calls
Total SIP call legs:2, User Agent Client:1, User Agent Server:1
SIP UAC CALL INFO
Call 1
SIP Call ID      : C9A3AA00-B49A11E8-8018A74B-CD0B0450@10.0.0.1
State of the call : STATE_ACTIVE (7)
Substate of the call : SUBSTATE_NONE (0)
Calling Number   : 1234

```

Verifying the Dial-peer Recording

```

Called Number          : 9876
Called URI             : sip:9876@10.0.0.2:9800
