

Release Notes

First Published: 2019-12-03

Last Modified: 2020-03-04

Introduction

This document provides information regarding Cisco WAN Automation Engine (Cisco WAE) Release 7.1.3 and related patches.

Cisco WAN Automation Engine (WAE) provides the tools to create and maintain a model of the current network through the continual monitoring and analysis of the network and the traffic demands that are placed on it. This network model contains all relevant information about a network at a given time, including topology, configuration, and traffic information. You can use this information as a basis for analyzing the impact on the network due to changes in traffic demands, paths, node and link failures, network optimizations, or other changes.

The Cisco WAE platform is an open, programmable framework that interconnects software modules, communicates with the network, and provides APIs to interface with external applications.

This document contains the following topics:

- [Release Information for Cisco WAE 7.1.3 Patch 4, on page 1](#)

Release Information for Cisco WAE 7.1.3 Patch 4

This section provides information related to Cisco WAE Release 7.1.3 Patch 4 and contains the following topics:

- [Install Cisco WAE 7.1.3 Patch 4, on page 2](#)
- [Verify Signed Image for Mac, on page 3](#)
- [Resolved Bugs, on page 3](#)

Install Cisco WAE 7.1.3 Patch 4

This procedure outlines the steps necessary to upgrade to Cisco WAE 7.1.3 Patch 4:

Note Cisco WAE 7.1.3 Patch 4 is cumulative of the previous patches. You can upgrade to Cisco WAE 7.1.3 Patch 4 from Cisco WAE 7.1.3, Cisco WAE 7.1.3 Patch 1, Cisco WAE 7.1.3 Patch 2, or Cisco WAE 7.1.3 Patch 3.

Procedure

Step 1 Stop WAE services using supervisor.

```
supervisorctl stop wae:*
```

Step 2 Change permission of the install file using the command:

```
chmod 755 wae-v7.1.3-patch4-linux.bin
```

Step 3 Install Cisco WAE 7.1.3 Patch 3 using the following command:

```
# ./wae-v7.1.3-patch4-linux.bin [-i WAE_INSTALL_DIR] [-r WAE_RUN_DIR] [-b BACKUP_DIR]
```

where

WAE_INSTALL_DIR is the WAE install directory path.

WAE_RUN_DIR is the run directory path.

BACKUP_DIR is the backup directory to use when creating the patch.

Note During the backup phase of WAE installation, you may see a few messages on the terminal like:

```
cp: cannot stat ...
```

This is expected and does not cause any problems with the patch install.

Step 4 Start WAE services using supervisor:

```
supervisorctl start wae:*
```

Step 5 Confirm that all WAE services are running:

```
supervisorctl status
```

Step 6 On the WAE CLI, run:

```
admin@wae# packages reload
```

Note After installation of the patch, use the new version of Cisco WAE Design (7.1.3-patch4) that is available for download for all platforms.

WAE Design software for Mac OS is digitally signed. See [Verify Signed Image for Mac, on page 3](#) to verify the signed image.

Step 7 (Optional) If license_install tool was run previously from within the WAE install directory <WAE_INSTALL_DIR>, then run the license_install tool once again after installing this patch.

Verify Signed Image for Mac

Procedure

- Step 1** For Mac, the certificates and digital signatures are embedded in the downloaded files - WAE-Design-k9-7.1.3-patch4-MacOSX-x86_64.signed.bin respectively.
- Step 2** Run the self-extracting signed binary. This extracts the Release Binary and validates using the signature file.

Verification in Mac

```
ADMIN:MacSigned admin$ ./WAE-Design-k9-7.1.3-patch4-MacOSX-x86_64.signed.bin
Unpacking...
Verifying signature...
Downloading CA certificate from http://www.cisco.com/security/pki/certs/crcam2.cer ...
Successfully downloaded and verified crcam2.cer.
Downloading SubCA certificate from http://www.cisco.com/security/pki/certs/innerspace.cer
...
Successfully downloaded and verified innerspace.cer.
Verify CMD1: openssl verify -CAfile crcam2.cer innerspace.cer
Verify CMD2: openssl verify -CAfile crcam2.cer -untrusted innerspace.cer WAE-CCO_RELEASE.cer
Successfully verified root, subca and end-entity certificate chain.
Successfully fetched a public key from WAE-CCO_RELEASE.cer.
Successfully verified the signature of WAE-Design-k9-7.1.3-patch4-MacOSX-x86_64.tar.gz using
WAE-CCO_RELEASE.cer
Extracting the package from the TAR archive ...
tar -zxvf WAE-Design-k9-7.1.3-patch4-MacOSX-x86_64.tar.gz
Cleaning up ...
```

- Step 3** For MAC there is no installation binary, as the software is automatically extracted after verification process.

Resolved Bugs

The following are descriptions of the resolved bugs in Cisco WAE Release 7.1.3 Patch 4:

Table 1: Resolved Bugs

Bug ID	Description
CSCvs18201	Inventory information is not collected for Huawei VRP 5 and CPU/MEM for VRP 8.
CSCvs38462	Issues in collection of traffic information using traffic-poll-nimo.
CSCvs71913	Interfaces collected using topo-bgp-nimo are incorrectly labeled as TE-Enabled = T from WAE Design.
CSCvs95132	After netflow-nimo is started on Master server, the Agent server displays java.lang.NullPointerException error.
CSCvs98015	WAE SaGE is not updating properly.
CSCvs49443	Missing Nodes properties for ISIS Area and SID.
CSCvs50959	WAE Optical NIMO creates too many files in /tmp directory and does not clean it up.
CSCvs58735	login-find-multicast-nimo fails with Python cb_action error.
CSCvs68767	Intermittent DARE aggregation error and failure.

Bug ID	Description
CSCvs70161	cisco-wae-archive gets full with wae-python-vm.log files.
CSCvs73744	Traffic NIMO shows lots of errors in wae-java-vm.log.
CSCvs77750	WAE shows LSPs as Unrouted.
CSCvs83391	WAE sets a level1-2 link as level-1 breaking the traffic simulation across that link.
CSCvs95445	cfg_parse timeout occurs when traffic-poller begins/is running.
CSCvs29335	Layout NIMO does not copy SRLGs from the template.
CSCvt03263	Include the utility mate_access_test to validate net_access.txt update.

Release Information for Cisco WAE 7.1.3 Patch 3

This section provides information related to Cisco WAE Release 7.1.3 Patch 3 and contains the following topics:

- [What's New in Cisco WAE 7.1.3 Patch 3, on page 4](#)
- [Install Cisco WAE 7.1.3 Patch 3, on page 5](#)
- [Install Cisco WAE Live 7.1.3 Patch 3, on page 6](#)
- [Resolved Bugs, on page 7](#)
- [Known Limitations, on page 8](#)

What's New in Cisco WAE 7.1.3 Patch 3

The following features are new in Cisco WAE 7.1.3 Patch 3:

Changes to OPM Action APIs

The run methods implemented by all Optimization and Prediction Module (OPM) packages with action callbacks, now accept one additional argument: `sess_info`.

The APIs which require `Maapi` or `transaction handle`, are called with one additional parameter, namely `sess_info` (variable of type `SessionInfo`).

Following are some of the sample changes:

Existing	New
<pre>with self._in_read_transaction(): print self._trans</pre>	<pre>with self._in_read_transaction(sess_info): print sess_info.trans</pre>
<pre>Self._maapi</pre>	<pre>Sess_info.maapi</pre>
<pre>self.is_nimo():</pre>	<pre>self.is_nimo(sess_info):</pre>

Update OPMs you have developed, if any, to work with the new APIs.

Note The `maapi` and the transaction handle will not be properties of the `OpmActionBase` object itself, but of the `SessionInfo` object.

There are no changes to network model traversal/modification APIs.

Optical build topology model resync for L1-L3 mapping updates

Schedule the `build-optical-topology` resync action of optical nimo to get updates related to L1-L3 mapping:

```
Networks networks <optical_nimo_name> nimo optical_nimo build-optical-topology resync true
```

Introduction of pause action on XTC agent

When pause action is invoked on the XTC agent (either on topo or LSP), the XTC agent completes processing the message it is currently processing and as soon as the message is processed, next message and subsequent messages are put into a queue. This allows the NIMOs to be run for collection.

A new **pause-xtc-agent** option is introduced for `topo-bgppls-xtc-nimo` and `lsp-pcep-xtc-nimo` which can be set during NIMO collection.

To set this option, when you configure Topology Collection using XTC or LSP Collection using XTC, navigate to **advanced** → **xtc** tab and enable **pause-xtc-agent**. For information on how to configure Topology Collection using XTC or LSP Collection using XTC, see *Cisco WAE User Guide*.

Profile ID configuration option for Bandwidth Optimization application

In Cisco WAE 6.6.2 XR release, the SR LSPs do not autoroute by default.

Configure bandwidth optimization application to set **profile-id** which enables autoroute. To configure bandwidth optimization, navigate to `/wae:wae/components/bw-opt` and click the **config** tab and set **profile-id**. The default value for profile-id is 0, which indicates the Bandwidth Optimization application to not use the profile-id. When a profile-id is set, all the LSPs deployed are created with that profile-id in the router. These SR LSPs are then enabled to autoroute.

For more information on how to configure bandwidth optimization, see *Cisco WAE User Guide*.

Install Cisco WAE 7.1.3 Patch 3

This procedure outlines the steps necessary to upgrade to Cisco WAE 7.1.3 Patch 3:

Note Cisco WAE 7.1.3 Patch 3 is cumulative of the previous patches. You can upgrade to Cisco WAE 7.1.3 Patch 3 from Cisco WAE 7.1.3, Cisco WAE 7.1.3 Patch 1, or Cisco WAE 7.1.3 Patch 2.

Procedure

Step 1 Stop WAE services using supervisor.

```
supervisorctl stop wae:*
```

Step 2 Change permission of the install file using the command:

```
chmod 755 wae-v7.1.3-patch3-linux.bin
```

Step 3 Install Cisco WAE 7.1.3 Patch 3 using the following command:

```
# ./wae-v7.1.3-patch3-linux.bin [-i WAE_INSTALL_DIR] [-r WAE_RUN_DIR] [-b BACKUP_DIR]
```

where

WAE_INSTALL_DIR is the WAE install directory path.

WAE_RUN_DIR is the run directory path.

BACKUP_DIR is the backup directory to use when creating the patch.

Note During the backup phase of WAE installation, you may see a few messages on the terminal like:

```
cp: cannot stat ...
```

This is expected and does not cause any problems with the patch install.

Step 4 Start WAE services using supervisor:

```
supervisorctl start wae:*
```

Step 5 Confirm that all WAE services are running:

```
supervisorctl status
```

Step 6 On the WAE CLI, run:

```
admin@wae# packages reload
```

Note After installation of the patch, use the new version of Cisco WAE Design (7.1.3-patch3) that is available for download for all platforms.

Step 7 (Optional) If license_install tool was run previously from within the WAE install directory <WAE_INSTALL_DIR>, then run the license_install tool once again after installing this patch.

Install Cisco WAE Live 7.1.3 Patch 3

Before you begin

You must have Cisco WAE 7.1 or later installed to perform this upgrade.

Procedure

Step 1 Stop the web server.

```
# wae-live-stop
```

Step 2 Install Cisco WAE Live 7.1.3 Patch 3. See "Install Cisco WAE Live" chapter in *Cisco WAE 7.1.3 Installation Guide* for the install steps.

Step 3 Start the web server.

```
# wae-live-start
```

Resolved Bugs

The following are descriptions of the resolved bugs in Cisco WAE Release 7.1.3 Patch 3:

Table 2: Resolved Bugs

Bug ID	Description
CSCvs04872	In WAE 7.1.3 Patch 2, CBD commit throws an error when High Availability (HA) is enabled.
CSCvp90286	WAE 7.1.3 does not function properly anymore as /tmp is full of WAE temporary files.
CSCvq86258	WAE XTC agent maintains multiple connections with XTC leading to increase in XTC memory usage.
CSCvr16940	snmp-find-multicast-nimo collection fails though logs capture collected multicast data.
CSCvr38394	In WAE 7.1.3 Patch 2, when attempting to execute run-config-parse, WAE fails with illegal reference error for p2mp-lsp-name.
CSCvr41625	After running collection for cisco-wae-optical-epnm-agent, the I1 circuit JSON data is written to net-record-dir but CDB shows no entries.
CSCvr69257	Optical network does not identify newly added L3 nodes.
CSCvr86225	wae.log throws CRIT errors showing instabilities in the processes and application restarts.
CSCvp84555	remove-node-suffix configuration not available on Cisco WAE UI.
CSCvq21153	WAE Design shows a hidden network in the drop down list while trying to open plan file from WAE Automation server.
CSCvq56906	Intermittent failures occur while writing plan files to archives.
CSCvr18459	For large network, traffic calculation takes a long time, and this time is not consistent.
CSCvr38414	In WAE 7.1.3 Patch 2, continuous poller fails to restart properly.
CSCvr51385	Maximum opened files option in netflow agent or flow collector tools is always set to 4096 when WAE is started using supervisorctl.
CSCvr57419	Notifications received from EPNM agent even when subscribe-to-notifications is set to 'false'.
CSCvr60938	NetIntHistory table shows duplicate entries for traffic polling update.
CSCvr61116	Intermittent Failures seen in topo-bgp-nimo collection.
CSCvr67581	While using WAE Live map, there is an error message showing WAE collector server password.
CSCvs12340	Scheduler does not run as expected every 3 hours.
CSCvs19120	Running topo-vpn-nimo throws the following error: Abort run-vpn-discovery because collection is in progress
CSCvo28214	WAE Live does not have the same map as WAE Design.
CSCvo76867	WAE Live 7.1.2 production server takes time to insert plan file.

Bug ID	Description
CSCvr98733	While using Netflow, <code>flow_collector_ias</code> must use only one switch for computation timeout.
CSCvp99466	<code>sr_te_bw_opt</code> fails to find a solution with all link utilization below threshold value, though such a solution exists.

Known Limitations

- Reactive changes related to XTC will not be effective on New Master after Failover. For XTC related reactive changes to work, WAE server needs to be restarted on New Master.

Release Information for Cisco WAE 7.1.3 Patch 2

This section provides information related to Cisco WAE Release 7.1.3 Patch 2 and contains the following topics:

- [What's New in Cisco WAE 7.1.3 Patch 2, on page 8](#)
- [Install Cisco WAE 7.1.3 Patch 2, on page 9](#)
- [Install Cisco WAE Live 7.1.3 Patch 2, on page 10](#)
- [Resolved Bugs, on page 11](#)

What's New in Cisco WAE 7.1.3 Patch 2

The following features are new in Cisco WAE 7.1.3 Patch 2:

Layout NIMO Enhancements

Layout NIMO is enhanced with a simpler workflow. The template information is now stored in native format which also enables a faster execution time.

Following is the new workflow introduced in this patch:

- From the Expert Mode, navigate to `/wae:networks`.
- Click the plus (+) sign and enter a network model name. We recommend a unique name that contains the source network and NIMO names. This procedure uses `networkABC_layout` as an example.
- Click **Add**.
- Click the **nimo** tab.
- From the **Choice - nimo-type** drop-down list, choose **layout-nimo**.
- Click **layout-nimo** and enter the following:
 - **source-network** - Enter the source network for the network to use.
 - **storage-format** - Select between yang and native formats.
 - **template-plan-file-path** - Enter the absolute path of the template file to be used by layout nimo.
- Launch WAE Design and choose **File > Open From > WAE Automation Server**.

- Enter the appropriate details, choose the plan file for the network model you just created (networkABC_layout), and click **OK**.
- Edit the layout.
- Click **Save to > WAE Automation Server**. Enter the plan file details and click **OK**.
- From the Expert Mode, click **run-layout > Invoke run-layout**.
- Navigate back to the layout-nimo network model (networkABC_layout).
- Click **layouts** tab.
- Click **layout** to confirm that the table has been populated with layout data.

WAE Design Enhancements

WAE Design now allows you to directly update the Layout NIMO template file.

Once you edit the network layout, save the plan file using the option **Save to > WAE Automation Server**. Enter the plan file details and click **OK**.

Aggregator Configuration Options

A new aggregator configuration option **cache-aggr-net** is introduced in the **Advanced** tab (Navigation: From the Expert Mode, navigate to **/wae:wae/components/aggregators/advanced**).

When this value is set to True, a copy of the aggregator plan is maintained on disk which is used to fetch data during the get-plan requests on aggregator network, unless the file is an old version. (Database has got updated after the last time the plan file was generated). Default value is False.

Supported Node Versions

The following table lists the supported XR versions for Cisco WAE 7.1.3 Patch 2 along with earlier supported XR versions on WAE 7.1.3:

Table 3: Supported Node Versions for Cisco WAE 7.1.3 Patch 2

Feature	Product	Tested with version
XTC (SR - PCE)	IOS-XR	6.6.2
Rest of Nodes (PCC)	IOS-XR	6.5.3, 6.6.2

Install Cisco WAE 7.1.3 Patch 2

This procedure outlines the steps necessary to upgrade to Cisco WAE 7.1.3 Patch 2:

Note Cisco WAE 7.1.3 Patch 2 is cumulative of the previous patches. You can directly upgrade to Cisco WAE 7.1.3 Patch 2 from Cisco WAE 7.1.3 or Cisco WAE 7.1.3 Patch 1.

Procedure

Step 1 Stop WAE services using supervisor.

```
supervisorctl stop wae:*
```

Step 2 Change permission of the install file using the command:

```
chmod 755 wae-v7.1.3-patch2-linux.bin
```

Step 3 Install Cisco WAE 7.1.3 Patch 2 using the following command:

```
# ./wae-v7.1.3-patch2-linux.bin [-i WAE_INSTALL_DIR] [-r WAE_RUN_DIR] [-b BACKUP_DIR]
```

where

WAE_INSTALL_DIR is the WAE install directory path.

WAE_RUN_DIR is the run directory path.

BACKUP_DIR is the backup directory to use when creating the patch.

Note During the backup phase of WAE installation, you may see a few messages on the terminal like:

```
cp: cannot stat ...
```

This is expected and does not cause any problems with the patch install.

Step 4 Start WAE services using supervisor:

```
supervisorctl start wae:*
```

Step 5 Confirm that all WAE services are running:

```
supervisorctl status
```

Step 6 On the WAE CLI, run:

```
admin@wae# packages reload
```

Note After installation of the patch, use the new version of Cisco WAE Design (7.1.3-patch2) that is available for download for all platforms.

Step 7 (Optional) If license_install tool was run previously from within the WAE install directory <WAE_INSTALL_DIR>, then run the license_install tool once again after installing this patch.

Install Cisco WAE Live 7.1.3 Patch 2

Before you begin

You must have Cisco WAE 7.1 or later installed to perform this upgrade.

Procedure

Step 1 Stop the web server.

```
# wae-live-stop
```

Step 2 Install Cisco WAE Live 7.1.3 Patch 2. See "Install Cisco WAE Live" chapter in *Cisco WAE 7.1.3 Installation Guide* for the install steps.

Step 3 Start the web server.

```
# wae-live-start
```

Resolved Bugs

The following are descriptions of the resolved bugs in Cisco WAE Release 7.1.3 Patch 2:

Table 4: Resolved Bugs

Bug ID	Description
CSCvo01833	The final model does not contain the right number of SR LSPs discovered from XTC.
CSCvo39768	WAE 7.1.3 Design client takes 1 minute to open the model from Automation Server.
CSCvp63150	DesignApi process memory footprints increased to 23 GB causing VM RAM utilisation to 91%.
CSCvp86817	After restarting WAE, the archive action does not work and times out.
CSCvq09313	EPNM Optical Agent unable to upload to CDB due to Invalid Value error.
CSCvq09684	The final network \"tis\" is not aligned with Layout network.
CSCvq11492	Plan files not inserted to WAE Live server and a timeout occurs.
CSCvq15406	flow_get - timeout error displayed.
CSCvq16634	The Layout NIMO does not reflect the DARE nodes counter.
CSCvq40906	BW-OPT fails to create SR policy.
CSCvq48423	Demand NIMO does not for site-site demand mesh creation.
CSCvq66736	Perceived advertised polling time (plan file generation time) affected by random execution times.
CSCvq79488	Java Exception in topo-igp results in 'Out Of Memory' error.
CSCvq87842	topo-bgp-nimo execution results in 'invalid value for peer-id' error.
CSCvr16822	WAE 7.1.3 Design client takes more time to open archive files when compared to regular plan files.
CSCvo78480	DARE rebuild creates another DARE network when one network gets sourced to multiple DARE network.
CSCvp90288	SNMPv3 support for inventory collection.
CSCvq12997	Status page does not get populated correctly.
CSCvq21164	WAE 7.1.3 Patch 1 install script removes the license.
CSCvq31857	WAE health statistics not visible on browsers (Firefox,Chrome).
CSCvq38200	The Inter-AS merge NIMO drops ASes that are previously merged on separate NIMOs.
CSCvq39105	WAE 7.1.2 displays Ice.ConnectionRefusedException when trying to run Plan Archive.
CSCvq66228	WAE 7.1.3 Patch 1 is impacted as /tmp folder is full of WAE tmp files.

Bug ID	Description
CSCvq97637	WAE 7.1.3 - External Executable NIMO error is displayed while copying plan file to CDB.
CSCvq57634	On WAE 7.1 Design, Save to ... Template option to be adapted for the Layout NIMO file template.
CSCvq53205	Supervisorctl file limits need to be increased at Install time.

Release Information for Cisco WAE 7.1.3 Patch 1

This section provides information related to Cisco WAE Release 7.1.3 Patch 1 and contains the following topics:

- [Install Cisco WAE 7.1.3 Patch 1, on page 12](#)
- [Resolved Bugs, on page 13](#)
- [Known Limitations, on page 13](#)

Install Cisco WAE 7.1.3 Patch 1

This procedure outlines the steps necessary to upgrade from Cisco WAE 7.1.3:

Before you begin

Make sure Cisco WAE 7.1.3 is installed before applying the patch.

Procedure

-
- Step 1** Stop WAE services using supervisor.
- ```
supervisorctl stop wae:*
```
- Step 2** Change permission of the install file using the command:
- ```
chmod 755 wae-v7.1.3-patch1-linux.bin
```
- Step 3** Install Cisco WAE 7.1.3 Patch 1 using the following command:
- ```
./wae-v7.1.3-patch1-linux.bin [-i WAE_INSTALL_DIR] [-r WAE_RUN_DIR] [-b BACKUP_DIR]
```
- where
- WAE\_INSTALL\_DIR is the WAE install directory path.
- WAE\_RUN\_DIR is the run directory path.
- BACKUP\_DIR is the backup directory to use when creating the patch.
- Step 4** Start WAE services using supervisor:
- ```
supervisorctl start wae:*
```
- Step 5** Confirm that all WAE services are running:
- ```
supervisorctl status
```

- Step 6** On the WAE CLI, run:
- ```
admin@wae# packages reload
```
- Note** After installation of the patch, use the new version of Cisco WAE Design (7.1.3-patch1) that is available for download for all platforms.
- Step 7** (Optional) If license_install tool was run previously from within the WAE install directory <WAE_INSTALL_DIR>, then run the license_install tool once again after installing this patch.

Resolved Bugs

The following are descriptions of the resolved bugs in Cisco WAE Release 7.1.3 Patch 1:

Table 5: Resolved Bugs

Bug ID	Description
CSCvo81254	WMD crashes when tested using wae713 Alpha image.
CSCvo88515	WAE application crashes after invoking/executing <code>custom-network-info</code> task.
CSCvp60520	Unable to keep active connection with XTC
CSCvp62803	WMD does not get traffic from traffic-poll-nimo
CSCvp67250	Mismatch in traffic information data between WMD and traffic-poll-nimo
CSCvp86817	Archiving in WAE times out after restarting WAE.
CSCvp90286	WAE 7.1.3 does not function properly as /tmp is full of WAE tmp files.
CSCvo36676	WAE server crashes while java processes continue running.
CSCvp52105	WAE CLI freezes on commit
CSCvn72882	Unable to discover multi-topology ISIS from Alcatel device
CSCvp44310	WAE Design takes time to recalculate simulated traffic numbers when Multicast tables are included.
CSCvq01121	The traffic balance of external endpoint member is rounded off when a plan file is imported.

Known Limitations

This section describes known limitations and restrictions for Cisco WAE Release 7.1.3 Patch 1:

CSCvp63150: DesignApi process memory footprints increased.

This issue can be resolved using the following workaround:

- From the Expert Mode, navigate to `/wae:wae/components/wmd:wmd` and click **config**.
 - From the **network-name** drop-down list, select the final network model.
 - Click **rpc-connection** and set **respawn-on-reload** to true.

2. Navigate to `/wae:wae/components/aggregators/aggregator <network_name>` and schedule the `resync-aggregator-net` action.
3. After making the changes, run the following command on WAE CLI:

```
admin@wae# packages reload
```

CSCvo36676: WAE server crashes leaving java processes running.

This issue can be resolved by upgrading Network Service Orchestrator to version 4.7.4 as part of WAE 7.1.3 patch 1.

CSCvo88515: WAE application crashes with errors "unexpected end of file" and "exception internal" after invoking or executing the `custom-network-info` task.

This issue can be resolved by upgrading Network Service Orchestrator to version 4.7.4 as part of WAE 7.1.3 patch 1.

Release Information for Cisco WAE 7.1.3

This section provides information related to Cisco WAE Release 7.1.3 and contains the following topics:

- [What's New in Cisco WAE 7.1.3, on page 14](#)
- [Install Cisco WAE 7.1.3, on page 18](#)
- [Supported Node Versions, on page 20](#)
- [Resolved Bugs, on page 20](#)
- [Known Limitations, on page 22](#)

What's New in Cisco WAE 7.1.3

The following features are new in Cisco WAE 7.1.3.

Supervisor

WAE services have to be managed using Supervisor. Install and run Supervisor before starting WAE.

For more information, see *Cisco WAE 7.1.3 Installation Guide*.

New Cisco Evolved Programmable Network Manager (Cisco EPN Manager) agent added

A new Cisco Evolved Programmable Network Manager (Cisco EPN Manager) agent is added to support the collection of optical topology for Cisco Network Convergence System (NCS) 2000 series, Release 10.9. This agent also receives notifications from Cisco EPN Manager version 2.2.2.1 when the status of links and circuits change and updates the network model accordingly. When using the Expert Mode, changes to the nodes, circuits, and so on can be seen in the agent-model tab from the following path:
`wae:wae/agents/optical-agent:optical-agents/optical-agent/<epnm_agent_name>`.

Note If optical provisioning is not done through Cisco EPN Manager, notifications are not received.

For more information, see "Network Model Configuration—Cisco WAE UI" chapter in the *Cisco WAE 7.1.3 User Guide*.

lsp-config-nimo updated

LSP collection (lsp-config-nimo) configuration is updated to integrate with NSO using the NETCONF API.

For more information, see "Network Interface Modules (NIMOs)" chapter ("Segment Routing Traffic Matrix Collection" topic) in the *Cisco WAE 7.1.3 User Guide*

Segment Routing traffic matrix collection updated

Segment Routing (SR) Traffic Collection (sr-traffic-matrix-nimo) discovers SR traffic. This NIMO enables the generation of demands between external interfaces of a network from collected telemetry data.

For more information, see:

- "Network Interface Modules (NIMOs)" chapter ("Segment Routing Traffic Matrix Collection" topic) in the *Cisco WAE 7.1.3 User Guide*
- "Telemetry Configuration" chapter in the *Cisco WAE 7.1.3 User Guide*

DARE enhancement to process aging

The DARE aging processor is enhanced to maintain an in memory map for aged elements instead of doing the CDB scan every time the aging scheduler runs.

For more information, see "Administration" chapter ("Configure Aging" topic) in the *Cisco WAE 7.1.3 User Guide*.

XATP dependency on WMD removed

XATP functionality is moved into the two NIMOs that process data from XTC - `topo-bgppls-xtc-nimo` and `lsp-pcep-xtc-nimo`, removing the dependency on WMD.

NIMO enhancement to support native format

The following NIMOs are enhanced to support native storage format:

- Traffic Demand NIMO
- Layout NIMO
- Inventory NIMO
- Netflow NIMO
- SRTM NIMO

For more information, see "Network Interface Modules (NIMOs)" chapter in the *Cisco WAE 7.1.3 User Guide*.

Multicast NIMO

Multicast NIMO collects multicast flow data from a given network. It is a collection of the following NIMOs:

- `snmp-find-multicast-nimo`—Collects multicast data for multicast flows using SNMP.
- `snmp-poll-multicast-nimo`—Collects traffic data rate for multicast flows using SNMP.
- `login-find-multicast-nimo`—Logs in to router to fetch or parse multicast flow data.
- `login-poll-multicast-nimo`—Logs in to router to get multicast traffic rate

For more information, see "Network Interface Modules (NIMOs)" chapter in the *Cisco WAE 7.1.3 User Guide*.

port-cfg-parse-nimo is now renamed to topo-cfg-parse-nimo

`port-cfg-parse-nimo` is now renamed to `topo-cfg-parse-nimo` and the support to read topology from parse configs is added.

For more information, see "Network Interface Modules (NIMOs)" chapter ("Port, LSP, SRLG, and VPN Collection Using Configuration Parsing" topic) in the *Cisco WAE 7.1.3 User Guide*.

Introduction of SAgE Aggregator

A new aggregator, SAgE (Simple Aggregation Engine), is introduced to receive patches from DARE and NIMOs depending on DARE and aggregate these changes.

For more information, see "Overview" chapter ("Cisco WAE Architecture" topic) in the *Cisco WAE 7.1.3 User Guide*.

Merging of Plan Files from different AS

`inter-as-nimo` is introduced to enable merging of plan files from different AS and resolve conflicts.

For more information, see "Network Interface Modules (NIMOs)" chapter ("Merge AS Plan Files" topic) in the *Cisco WAE 7.1.3 User Guide*.

Cisco WAE UI Enhanced

Cisco WAE 7.1.3 is enhanced with various UI changes.

For more information, see "Network Model Configuration—CiscoWAE UI" chapter in the *Cisco WAE 7.1.3 User Guide*

Status Dashboard

The status dashboard in WAE helps to identify the processes that cause system leaks or processes that completely use the resources. System health, WAE health, status of NIMO actions and agent actions are captured in the dashboard.

For more information, see "Administration" chapter ("Status Dashboard" section) in the *Cisco WAE 7.1.3 User Guide*.

Building network model from multiple XTC

WAE 7.1.3 now supports building network model from multiple XTC.

Traffic Poller Modified

Traffic Poller tuning is enhanced for better computing.

For more information, see "Network Interface Modules (NIMOs)" chapter ("Traffic Collection" topic) in the *Cisco WAE 7.1.3 User Guide*

Option to cleanup the cache for Map display in Cisco WAE Live

Users can now cleanup Map cache based on configurable attribute in `config.xml`. By default, the cache for Map display is cleaned up every 3 days. To clean up the cache more frequently, you can configure as follows:

1. Stop the Cisco WAE web server.
2. Log in to your local server and open `config.xml` file for editing. The default location is `/opt/cariden/etc/config/config.xml`. Your location might differ if you chose a different installation directory.
3. In the `config.xml` file, locate the section - `<application name="Map">`
4. Under `<application name="Map">`, do one of the following, depending on whether you are upgrading or performing a fresh installation:

- If you are upgrading from an earlier release, add the following line:

```
<property name="Map.UiCacheTTL" type="String"><value> <unit></property>
```

- If you are performing a fresh installation, edit the existing line:

```
<property name="Map.UiCacheTTL " type="String"><value> <unit></property>
```

where

<value> is a float (a floating-point number, or a number that has a decimal place).

<unit> is either hour, or day. The unit can be singular or plural and is not case-sensitive. For example, hour can be expressed in all of the following ways: hour, Hour, Hours, HOURS.

For example, to purge time-series data that is older than 1 hour, enter:

```
<property name="Map.UiCacheTTL" type="String">1 hour</property>
```

5. Save your changes and close the `config.xml` file.
6. Restart the Cisco WAE web server.

Capacity Planning Optimization for Cisco WAE Design

The Capacity Planning Optimization tool controls how L1 Circuits and their corresponding paths are created. However, it automatically mimics the L1 Circuit characteristics of existing parallel L1 Circuits when upgrading capacity.

To enhance the Capacity Planning Optimization tool to handle different scenarios, the following CLI options are introduced:

- `-match-existing-l1-circuits`: This is a new option that is added. If set to T, when existing L3 adjacencies are upgraded (by adding parallel Port Circuits or L3 Circuits), corresponding L1 Circuits are created based on associated L1 Circuits of parallel Port Circuits or L3 Circuits. This includes replicating primary and secondary paths with respect to their Standby property as well as their associated Actual L1 Circuit Path Hops and L1 Circuit Path Hops. Default is F.
- `-create-l1-circuits`: This is a modified option. If F (default), do not create L1 circuits for new port circuits. If T, create L1 circuits for new port circuits. If `match-existing-l1-circuits` is set to T, this option is only considered for new adjacencies.
- `-primary-l1-circuit-paths`: This is a modified option. If F (default), primary L1 circuit paths are dynamically routed. If T, assign L1 circuit path hops to new primary L1 circuit paths to match the explicitly specified routes of existing parallel L1 circuits. Ignored if `-create-l1-circuits` is F or if `match-existing-l1-circuits` is set to T.
- `-secondary-l1-circuit-paths`: If F (default), do not create secondary non-standby L1 circuit paths. If T, create secondary non-standby L1 circuit paths. Ignored if `-create-l1-circuits` is F. If `match-existing-l1-circuits` is set to T, this option is only considered for new adjacencies.

Cisco WAE Design GUI is modified as follows:

Tools > Capacity Planning Optimization > Layer 1 tab has new options - **Do not create L1 circuits**, **Basic L1 Circuit Creation**, and **Advanced L1 Circuit Creation**.

load-plan CLI command modified

The load-plan CLI command (`wae/components/load-plan`) to load plan files can handle only plan files which have the `Network` table as defined in schema and the `Title` row. However, value for the title (network name) is optional.

Install Cisco WAE 7.1.3

This procedure outlines the steps necessary to upgrade to Cisco WAE 7.1.3.

Before you begin

- From Cisco WAE 7.1.3, the WAE services are managed using supervisor. Install and configure supervisor. See [Install and Configure Supervisor, on page 19](#)
- Download the Cisco WAE 7.1.3 software package from [Cisco Download Software](#) site.
- Make sure Java-8 is installed on the system and `JAVA_HOME` environment variable is pointing to `jdk-1.8`.

Procedure

Step 1 Stop WAE if running.

Step 2 Change permission of the install file using the command:

```
chmod +x wae-linux-v7.1.3.dev-xx-yyyyyyyyy.bin
```

Step 3 Run the installer specifying the target directory.

```
./wae-linux-v7.1.3.dev-xx-yyyyyyyyy.bin <wae-dir>
```

Step 4 Setup environment and create a runtime directory specifying the path.

```
cd <wae-dir>
source waerc
wae-setup --dest <target-runtime-dir>
```

Step 5 You are prompted to set the Cisco WAE admin password.

```
WAE admin password:
Confirm password:
```

Step 6 After installing and setting up wae (i.e. after running `wae-setup`), add WAE config to supervisor and update supervisor

```
sudo ln -sf <WAE_RUN_DIR>/wae.ini /etc/supervisord.d/
supervisorctl update
```

Note Execute this step only after supervisor is installed and configured.

Step 7 Start WAE process

```
supervisorctl start wae:*
wae:zookeeper: started
wae:waectl: started
wae:kafka: started
wae:wae-monitor: started
```

Step 8 Check status of WAE process

```
supervisorctl status
wae:kafka RUNNING pid 1540, uptime 28 days, 14:03:40
wae:logrotate RUNNING pid 1178, uptime 28 days, 15:10:11
wae:wae-monitor RUNNING pid 11520, uptime 0:00:12
wae:waectl RUNNING pid 1177, uptime 28 days, 15:10:11
wae:zookeeper RUNNING pid 1736, uptime 28 days, 14:03:39
```

Note To stop all WAE process, use the command:

```
supervisorctl stop wae:*
```

Install and Configure Supervisor

For more information about supervisor, read <http://supervisord.org/installing.html>.

Procedure

Step 1 Install supervisor and verify.

```
sudo yum install -y epel-release
sudo yum install -y supervisor
supervisor -version
3.3.4
```

Step 2 Create directories with write permissions for the OS user running WAE.

```
sudo mkdir -p /var/run/supervisor
sudo mkdir -p /var/log/supervisor
sudo chown -R [USER-NAME]:[GROUP-NAME] /var/run/supervisor
sudo chown -R [USER-NAME]:[GROUP-NAME] /var/log/supervisor
```

Step 3 Update supervisor configuration to not run as a root user; point the pid file to `/var/run/supervisor/supervisor.pid` and user as the OS user running WAE:

Open `/etc/supervisord.conf` and edit.

Remove `pidfile=/var/run/supervisord.pid ; (supervisord pidfile;default supervisord.pid)` and add `pidfile=/var/run/supervisor/supervisord.pid ; (supervisord pidfile;default supervisord.pid)`.

Modify the line `user=chrism` to `user=[USER-NAME]`.

```
;user=chrism
```

to

```
user=[USER-NAME]
```

Note Remove ";" when you set the user name.

Step 4 Create a soft link from to the `wae.ini` file from inside `/etc/supervisord.d/`.

Step 5 After installing and setting up wae (i.e. after running `wae-setup`), add WAE config to supervisor and update supervisor

```
sudo ln -sf <WAE_RUN_DIR>/wae.ini /etc/supervisord.d/
supervisorctl update
```

Step 6 Start Supervisor.

```
sudo systemctl start supervisord
supervisorctl status all
```

Step 7 Enable supervisor to start during system startup.

```
sudo systemctl enable supervisord
sudo systemctl status supervisord
```

Note `wae:waectl` is the WAE program. `wae:kafka` and `wae:zookeeper` are required for traffic collection. `wae:wae-monitor` is the monitoring service. `wae:logrotate` is for log rotation.

Supported Node Versions

The following table lists the supported node versions for Cisco WAE 7.1.3.

Table 6: Supported Node Versions for Cisco WAE 7.1.3

Feature	Product	Tested with version	Notes
SRTM	IOS-XR	6.5.1	
Netconf LSP	IOS-XR	6.5.1	NED Version : ncs-4.7.1-cisco-iosxr-7.6
	IOS-XR	15.3	NED Version : ncs-4.7.1-cisco-ios-6.7
	Juniper Junos Mx960	18.1R1.9	NED Version: ncs-4.7.1-juniper-junos-4.1
RT Apps, Multi XTC, Reactive polling.	IOS-XR	6.5.1	
Multilayer	NCS2K	10.7,10.8,10.9	
	EPNM	2.2.1.1	

Resolved Bugs

The following are descriptions of the resolved bugs in Cisco WAE Release 7.1.3:

Table 7: Resolved Bugs

Bug ID	Description
CSCvn17584	Error on running topo-vpn-nimo .
CSCvn18171	DARE not updating WMD model when LSP is deleted.
CSCvn26138	Unable to run Plan-Archive in WAE 7.1.2.
CSCvn30441	WAE 7.1.1 unable to run topo-bgpls-xtc-nimo and run-xtc-collection due to missing element error.
CSCvn51907	actual_path hops are not available in DARE Aggregator.
CSCvn62567	Wrong Spectral Width ID causing circuit status "unrouted" in WAE Design L1 Circuit Paths.

Bug ID	Description
CSCvn88920	WAE 7.1.2 fails to create new plan files.
CSCvo01833	Wrong number of LSPs reported in model.
CSCvo01841	Unreliable mechanism to produce statistics in a native-format file.
CSCvo11400	WMD shows wrong path for LSPs (RSVP-TE), where as lsp-snmp-nimo , aggregator nimos discovers path correctly.
CSCvo22803	WAE keeps filing /tmp with files.
CSCvo45650	Multiple node perf data issues reported in topo-igp-nimo .
CSCvm34065	DARE not processing changes, displays 'Queue full' in error.
CSCvn00892	login_find_igp_db output sets nodes::AvoidTransit value to "Strict" .
CSCvn04684	cfg-parse agent should ignore hash (#) in description for Huawei.
CSCvn06202	Simulation of Multicast Demands is inconsistent.
CSCvn07232	LSP parse config nimo or parse_config fuction is unable to parse configs with space in hostname.
CSCvn12341	Capacity Planning Opt Tool Not Creating L1 Circuits in Some Cases
CSCvn21122	WAE 7.1.2 Site lat/long values are missing in DARE.
CSCvn22430	Capacity Optimization Planning does not copy L1 circuit hops.
CSCvn26803	cfg-parse agent incorrectly parses LSP paths on Huawei devices.
CSCvn28694	WAE daemon crashing without notice.
CSCvn30828	Optical NIMO collection not collecting Site-names
CSCvn56924	duplicate ref error thrown when node fails collection.
CSCvn66222	WAE Design L1 Links table displays 'na' instead of Metric for a very short fiber span < 1 km.
CSCvn75156	Executing run-snmp-traffic-poller logs Warning [20]: auth.enc not found under traffic_de-poller.log .
CSCvn78097	topo-bgpls-xtc-nimo not discovering interfaces for large network (500 devices).
CSCvn79097	Traffic NIMO stops inserting traffic in model.
CSCvn89056	WAE live 7.1.2 peering panel from the WAE Live Settings not working.
CSCvn94403	Optical NIMO fails to import circuits with user properties.
CSCvo04221	WAE 7.1.2 design does not populate LAG member port descriptions collected by the topo-igp-nimo .
CSCvo26901	Demand Flow uses Level 2 links during Failure simulation.
CSCvo32368	Windows mate-Design client crashes when you Hover on the "Initializers" menu.
CSCvn39867	WAE does see Juniper loose bypass LSP.

Bug ID	Description
CSCvo16665	WAE GUI has no support to pump SNMP traffic to traffic poller network.

Known Limitations

This section describes known limitations and restrictions for Cisco WAE:

WAE System

License Check Failures on Newer Linux Distributions

Some newer Linux distributions use a new way (using biosdevname) of naming hardware devices, including network interfaces. This causes some software that depends on the traditional naming (for example, eth0 , eth1) to fail on license checks.

The workaround is to append biosdevname=0 to the kernel line of the grub configuration file and reboot. (Syntax varies among distributions.)

After reboot, you should be able to use ifconfig to verify that the NICs are named eth0 (or eth1 , ...) instead of the biosdevname names (such as p34p1).

NIMO Consolidation

The aggregator uses DARE to consolidate NIMOs into one network model. If you update the topo-igp-nimo node-filter configuration, or if a node goes down after running the initial DARE configuration, you must do the following:

1. Update the topo-igp-nimo exclusion or inclusion list.
2. Run collection on the topo-igp-nimo.
3. Run the WAE CLI tool to resync DARE with the updated NIMO node information:

```

wae@wae# wae components aggregators aggregator <aggregator_network_name> resync aggregator
net

```

WAE Collection

- LDP data collection can only be performed by executing CLI tools using the external-executable-nimo.
- NetFlow collection is not supported on Alcatel-Lucent devices.
- Due to vendor MIB limitations, WAE cannot represent QoS traffic on interfaces that have more than one VLAN configured. If a network contains such interfaces, their queue traffic statistics are omitted from the collection. The total traffic on these interfaces is still measured. As a result, demands for every class of service estimated through Demand Deduction are less accurate. Estimates of traffic totals over all classes of services, however, are not affected.
- Collection of interface egress shaping rate for Alcatel-Lucent devices does not support LAG interfaces.
- Juniper MIBs do not support P2MP LSPs.
- WAE cannot associate a GRE tunnel with the physical interface it uses to reach the tunnel destination because the IP-Tunnel MIB lacks this information.

- For Juniper routers, the signaled standby LSP option is not available from the standard MPLS-TE MIB. Only the active path option name is collected.
- For Cisco IOS XR routers:
 - IGP topology collected through topo-igp-nimo module:
 - IS-IS link-state database with TE extensions contains incorrect interface “admin-weights” (TE metric) on Intel-based routers.
 - IPv6 IS-IS link-state database does not contain IPv6 interface addresses or parallel interfaces. This information is only available when Cisco IOS XR supports IS-IS IPv6 TE extensions.
 - MAC accounting is not supported (although you can collect MAC traffic through an external NIMO).
 - The lsp-snmp-nimo module does not set the Standby value in the <LSPPaths> table for signaled backup paths or collect named affinities configured with affinity-maps.
- BGP peers:
 - The topo-bgp-nimo module does not build BGP pseudo-nodes among internal ASNs.
 - The topo-bgp-nimo module does not collect BGP peers under PE-CE VRFs.
- TE Extended Admin Groups (EAGs), also known as extended affinities, are only supported from Juniper and parse_configs.
- There is no support for building port circuits for LAG members that are not within the same IGP (inter-AS circuits).
- It is not possible to distinguish between physically connected and unconnected LAG ports that are down for LAG port matching.
- With segment routing, concurrent RSVP-TE and SR-TE paths are not supported on the same LSP.

WAE Multilayer Collection

- The optical plug-in is supported on Oracle JRE 1.8 but not on OpenJDK JRE. Oracle JRE 1.8 is not packaged with Cisco WAE. You can download Oracle JRE 1.8 from Oracle’s website.

If you are using a JRE other than Oracle JRE 1.8 for other Java programs and you want to use the optical plug-in, you must download Oracle JRE 1.8 and add the following lines to the beginning of the <WAE_installation_directory> /packages/optical-ctc-plugin/run.sh file:

```
#!/bin/bash
export JAVA_HOME=<path_to_JRE_installation_directory>
export PATH=$JAVA_HOME/bin:$PATH
```

- Multilayer collection for Cisco devices is supported only on the following platforms:
 - Cisco Network Convergence System (NCS) 2000 platforms running version 10.61, 10.7, and 10.8 for L1 devices when using the CTC optical agent. NCS 2000 platforms running version 10.9 is supported when using the Cisco Evolved Programmable Network Manager optical agent (EPN-M optical agent).
 - Cisco Aggregation Services Routers (ASR) 9000, Cisco Carrier Routing System (CRS), and Cisco NCS 5500 platforms running IOS-XR for L3 devices.

- Multilayer collection is limited to the collection of unprotected circuits.
- Collection of WSON and SSON circuits are supported.
- Collection of non-WSON circuits is only supported when using the EPN-M optical agent. It is not supported when using the CTC optical agent.
- L3-L1 mapping by LMP is supported only if the controller interface name is the same as the actual L3 interface name or of the form "dwdmx/x/x/x" where the "x/x/x/x" subscript matches that of the corresponding L3 interface.
- Central Frequency ID mapping is currently supported only for circuit paths but not for path hops.

WAE Design

- macOS Sierra 10.12 and later implements an additional security measure for applications that are not distributed through the App Store; this includes WAE Design.

By default, WAE Design is in a quarantine state as shown by the following command on a terminal:

```
xattr wae_design.app
```

The command returns the following output for a quarantined application:

```
com.apple.quarantine
```

As a workaround, remove WAE Design from quarantine by entering the following command in the directory where WAE Design is installed:

```
xattr -r -d com.apple.quarantine wae_design.app
```

You can now run WAE Design from macOS Sierra 10.12 and later.

- If you are using macOS X 10.12 or later with the WAE Design GUI and the Parse Configs tool (**File > Get Plan from > Configs**), add the following lines in ~/.bash_profile:

```
launchctl setenv JAVA_HOME `/usr/libexec/java_home -v 1.8`
export JAVA_HOME=$(/usr/libexec/java_home -v 1.8)
```

FlexLM License Server

You cannot run the floating license server on a setup (Linux VM or actual host) that uses bonded virtual interfaces (that is, a setup with multiple interfaces that have the same MAC address but different IP addresses within a VM). If the WAE Design client tries to check out a license from a setup that uses bonded virtual interfaces, the license checkout fails with the error "No license found."

As a workaround, run the floating license server in a standard Linux VM or host.

WAE Coordinated Maintenance

Cisco WAE Coordinated Maintenance 1.3.1 supports the WAE archive only when the data source is CDB.

Documentation

To find descriptions of all related Cisco WAE documentation, see the Cisco WAE 7.1.3 Documentation Roadmap.

Note We sometimes update the documentation after original publication. Therefore, you should always review the documentation on Cisco.com for any updates.

Filing a Cisco WAE Bug

While filing CDETS for Cisco WAE, make sure the following information is captured:

- WAE configuration: supervisor configuration, aggregator configuration and the nimo configuration of concerned network and its source-network, if any.
- `<run-dir>/logs/ directory`
- Plan file(s) for the network(s) of concern
- `<run-dir>/data/stats/` for system stability and resource usage related issues
- `<run-dir>/work/dare/` for aggregation related issues.
- `<run-dir>/data/networks/*.db` for issues related to networks configured as ‘native’ and the corresponding aggregator (final-network).
- CDB dump of the networks of concern for networks of ‘yang’ format (‘yang’ is the default storage-format).
- Configuration corresponding to the component of concern. Eg: WMD, archive etc.
- For collection issues, record file(s) if the nimo supports record-playback.
- `~/cariden/logs/` for designapid related issues.

Using the Cisco Bug Search Tool

You can use the Cisco Bug Search Tool to search for a specific bug or to search for all bugs in a release.

Procedure

Step 1 Go to the <http://tools.cisco.com/bugsearch>.

Step 2 Enter your registered Cisco.com username and password, and click **Log In**.

The Bug Search page opens.

Note If you do not have a Cisco.com username and password, you can <http://tools.cisco.com/RPF/register/register.do>.

Step 3 Use any of these options to search for bugs, and then press Enter (Return) to initiate the search:

- To search for a specific bug, enter the bug ID in the Search For field.
- To search for bugs based on specific criteria, enter search criteria, such as a problem description, a feature, or a product name, in the Search For field.
- To search for bugs based on products, enter or select a product from the Product list. For example, if you enter “WAE,” you get several options from which to choose.

- To search for bugs based on releases, in the Releases list select whether to search for bugs affecting a specific release, bugs that were fixed in a specific release, or both. Then enter one or more release numbers in the Releases field.

Step 4 When the search results are displayed, use the filter tools to narrow the results. You can filter the bugs by status, severity, and so on.

To export the results to a spreadsheet, click **Export Results to Excel**.

Accessibility Features

For a list of accessibility features in Cisco WAE, visit <https://www.cisco.com/c/en/us/about/accessibility/voluntary-product-accessibility-templates.html> (VPAT) website, or contact accessibility@cisco.com.

All product documents except for images, graphics, and some charts are accessible. If you would like to receive the product documentation in audio format, braille, or large print, contact accessibility@cisco.com.
