

# Cisco Virtual Security Gateway System Management

This chapter describes system management on the Cisco Virtual Security Gateway (VSG).

This chapter includes the following sections:

- Information About VSG System Management, page 4-1
- Changing the Cisco VSG Instance Name, page 4-2
- Configuring a Message of the Day, page 4-2
- Verifying the Configuration, page 4-3
- Saving a Configuration, page 4-10
- Erasing a Configuration, page 4-11
- Displaying a Cisco VSG Instance, page 4-11

# **Information About VSG System Management**

The Cisco Virtual Security Gateway (VSG) enables you to use command-line interface (CLI) configuration commands to do standard system management functions such as the following:

- Changing the hostname
- Configuring messages of the day
- Displaying, saving, and erasing configuration files
- Providing a single interface to all file systems including
  - Flash memory
  - FTP and TFTP
  - Running configuration
  - Any other endpoint for reading and writing data
- Identifying users connected to the VSG
- Sending messages to single users or all users

## **Changing the Cisco VSG Instance Name**

You can change the Cisco VSG instance name or prompt. If you have multiple instances of Cisco VSGs, you can use this procedure to uniquely identify each Cisco VSG.

#### **BEFORE YOU BEGIN**

Before beginning this procedure, you must know or do the following:

• You are logged in to the CLI in global configuration mode.

#### **PROCEDURE**

	Command	Purpose
Step 1	configure	Places you in global configuration mode.
	Example: vsg# configure	
Step 2	hostname host-name	Changes the host prompt. The host-name argument
	Example: vsg(config) # hostname vsg100	maximum is 32 alphanumeric characters.

This example shows how to change the hostname (name of the VSG):

```
vsg# configure
vsg(config)# hostname metro
vsg(config)# exit
metro#
```

# **Configuring a Message of the Day**

You can configure a message of the day (MOTD) to display at the login prompt.

- The banner message can be up to 40 lines with up to 80 characters per line.
- Use the following guidelines when choosing your delimiting character:
  - Do not use the delimiting-character in the message string.
  - Do not use " and % as delimiters.
- The following tokens can be used in the the message of the day:
  - \$ (hostname) displays the host name for the switch.
  - \$(line) displays the vty or tty line or name.

#### **BEFORE YOU BEGIN**

Before beginning this procedure, you must know or do the following:

• You are logged in to the CLI in configuration mode.

Command	Purpose		
configure	Places you in global configuration mode.		
Example: vsg# configure			
banner motd [delimiting-character	Configures an MOTD with the following limits:		
message delimiting-character]	• Up to 40 lines		
<pre>Example: vsg(config) # banner motd #Hello#</pre>	• Up to 80 characters per line		
vbg(config)	Enclosed in a delimiting character, such as #		
	Can span multiple lines		
	Can use tokens		
show banner motd	Displays the configured banner message.		
<pre>Example: vsg(config)# show banner motd</pre>			

This example shows how to configure an MOTD:

```
vsg# configure
vsg(config)# banner motd #December 12, 2010 Welcome to the VSG#
vsg(config)# show banner motd
December 12, 2010 Welcome to the VSG
vsg(config)#
```

# **Verifying the Configuration**

This section includes the following topics on viewing the Cisco VSG configuration:

- Verifying the Software and Hardware Versions, page 4-3
- Verifying the Running Configuration, page 4-4
- Comparing the Startup and Running Configurations, page 4-6
- Displaying Interface Configurations, page 4-7

## **Verifying the Software and Hardware Versions**

You can view the versions of software and hardware on your system.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in any command mode.

# Command Description Step 1 show version Displays the versions of system software and hardware that are currently running on the VSG. Example: vsg# show version

This example shows how to display and verify the system software and hardware version information for your VSG:

```
vsg# show version
Cisco Nexus Operating System (NX-OS) Software

  Device name: vsg
  bootflash:
             2059572 kB
Kernel uptime is 1 day(s), 5 hour(s), 47 minute(s), 4 second(s)
plugin
  Core Plugin, Virtualization Plugin, Ethernet Plugin
```

## **Verifying the Running Configuration**

You can view the configuration currently running on the system.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in any command mode.

# Command Description Step 1 show running-config Displays the versions of system software and hardware that are currently running on the VSG. Example: vsg# show running-config

This example shows how to display the versions of system software and hardware running on the VSG:

```
vsg# show running-config
```

```
!Command: show running-config

## **Comparing the Startup and Running Configurations**

You can view the differences between the startup configuration and running configuration.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### **PROCEDURE**

	Command	Description
Step 1	show running-config diff	Displays the difference between the startup configuration and
	Example:	the running configuration.
	vsg# show running-config diff	

This example shows how to display the difference between the startup configuration and the running configuration:

```
vsg# show running-config diff
 *** Startup-config
 --- Running-config
 *** 14,34 ****
       banner motd #Nexus VSG#
       ssh key rsa 2048

## **Displaying Interface Configurations**

This section includes the following procedures:

- Displaying a Brief View of a Specific Interface Configuration, page 4-7
- Displaying a Detailed View of a Specific Interface Configuration, page 4-8
- Displaying a Brief View of All Interfaces, page 4-9
- Verifying the Running Configuration for All Interfaces, page 4-9

### **Displaying a Brief View of a Specific Interface Configuration**

You can display a brief view of a specific interface configuration.

#### **BEFORE YOU BEGIN**

Before using this procedure, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### **PROCEDURE**

	Command	Description		
Step 1	show interface {type} {name} brief	Displays a brief view of a specific interface configuration.		
	Example:			
	vsg# show interface brief			

The following example shows how to display a brief view of a specific interface configuration:

#### vsg# show interface brief

Port	VRF	Status	IP Address	Speed	MTU
mgmt0		up	10.193.73.10	1000	1500
Port					
FOIC	VRF	Status	IP Address	Speed	MTU

### **Displaying a Detailed View of a Specific Interface Configuration**

You can display a detailed view of a specific interface configuration.

#### **BEFORE YOU BEGIN**

Before using the command in this section, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### **PROCEDURE**

#### Step 1

Command	Description
<pre>show interface {type} {name}</pre>	Displays a detailed version of a specific interface connection.
Example:	
vsg# show interface mgmt 0	

This example shows how to display a detailed version of a specific interface connection:

```
vsg# show interface mgmt 0
mgmt0 is up
  Hardware: Ethernet, address: 0050.5689.3321 (bia 0050.5689.3321)
  Internet Address is 172.23.232.141/24
  MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA
  full-duplex, 1000 Mb/s
  Auto-Negotiation is turned on
    4961 packets input, 511995 bytes
    0 multicast frames, 0 compressed
    0 input errors, 0 frame, 0 overrun, 0 fifo
   245 packets output, 35853 bytes
    0 underrun, 0 output errors, 0 collisions
    0 fifo, 0 carrier errors
vsg#
```

### **Displaying a Brief View of All Interfaces**

You can display a brief view of all interfaces.

#### **BEFORE YOU BEGIN**

Before using this procedure, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### **PROCEDURE**

#### Step 1

Command	Description
show interface brief	Displays a brief view of all interfaces.
Example: vsg# show interface brief	

The following example shows how to display a brief view of all the interfaces on the VSG:

#### vsg# show interface brief

VRF		Stat	us IP A	Address		Speed	MTU	
		_					1500	
Э	VLAN	Туре	Mode	Status	Reason		-	Port Ch #
	1 262	eth eth	trunk access	up up	none none		1000(D) 1000(D)	
∋	VLAN	Туре	Mode	Status	Reason		MTU	
	630	virt virt	access access	up up	none none		1500 1500 1500 1500	
		VLAN  1 262  VLAN  630 630 631	VLAN Type  1 eth 262 eth  WLAN Type  630 virt 630 virt 631 virt	up 10  VLAN Type Mode  1 eth trunk 262 eth access  WLAN Type Mode  630 virt access 630 virt access 631 virt access	up 10.23.232.2  VLAN Type Mode Status  1 eth trunk up 262 eth access up  WLAN Type Mode Status  630 virt access up 630 virt access up 631 virt access up	up 10.23.232.141  VLAN Type Mode Status Reason  1 eth trunk up none 262 eth access up none  WLAN Type Mode Status Reason  630 virt access up none 630 virt access up none 631 virt access up none	up 10.23.232.141 1000  VLAN Type Mode Status Reason  1 eth trunk up none 262 eth access up none  WLAN Type Mode Status Reason  630 virt access up none 630 virt access up none 631 virt access up none	up 10.23.232.141 1000 1500  VLAN Type Mode Status Reason Speed  1 eth trunk up none 1000(D) 262 eth access up none 1000(D)  E VLAN Type Mode Status Reason MTU  630 virt access up none 1500 630 virt access up none 1500 631 virt access up none 1500

### **Verifying the Running Configuration for All Interfaces**

You can verify the running configuration for all interfaces.

The output for the command, **show running-config interface** differs from that of the command, **show interface**.

#### **BEFORE YOU BEGIN**

Before using this procedure, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### Step 1

Command	Description
show running-config interface	Displays the running configuration for all interfaces on your
Example: vsg# show running-config interface	system.

This example shows how to display the running configuration for all the interfaces on your VSG:

vsg# show running-config interface

```
!Command: show running-config interface
!Time: Sun Dec 12 16:29:08 2010

version 4.2(1)VSG1(1)

interface mgmt0
   ip address 10.193.73.10/16

interface data0
   ip address 10.10.10.10/24

vsg#
```

## **Saving a Configuration**

You can save the running configuration to the startup configuration, so that your changes are retained in the startup configuration file the next time that you start up your Cisco VSG.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### **PROCEDURE**

#### Step 1

Command	Description
copy running-config startup-configure	Saves the running configuration to the startup configuration.
Example: vsg# copy running-config startup-configure	

This example shows how to save the running configuration to your startup configuration:

```
vsg(config) # copy running-config startup-config
[############################ 100%
vsg(config)#
```

## **Erasing a Configuration**

You can erase a startup configuration.

The write erase command erases the entire startup configuration with the exception of loader functions.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

- You are logged in to the CLI.
- The following parameters are used with this command:
  - **boot**—Erases the boot variables and the mgmt0 IP configuration.
  - debug—Erases the debug configuration.

#### **PROCEDURE**

	Command	Description		
Step 1	write erase [boot   debug]	Erases the existing startup configuration and reverts all settings		
	Example:	to their factory defaults.		
	vsg# write erase debug	The running configuration is not affected.		

This example shows how to erase a debug startup configuration:

## **Displaying a Cisco VSG Instance**

You can display a Cisco VSG instance.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI.

### Step 1

Command	Description
show vsg	Displays the particulars of the Cisco VSG—including the model, the high
Example: vsg# show vsg	availability (HA) ID, the Cisco VSG software version and build, and the Cisco Virtual Network Management Center (VNMC) IP address.
	The running configuration is not affected.

This example shows how to display the Cisco VSG model, HA ID, software version and build, and the Cisco VNMC IP address:

```
vsg# show vsg
Model: VSG
HA ID: 10
VSG Software Version: 4.2(1)VSG1(1) build [4.2(1)VSG1(0.396)]
VNMC IP: 10.193.20.12
vsg#
```

# **Navigating the File System**

This section describes how to navigate the file system.

This section includes the following topics:

- Specifying File Systems, page 4-12
- Identifying Your Current Working Directory, page 4-13
- Changing Your Directory, page 4-13
- Listing the Files in a File System, page 4-14
- Identifying Available File Systems for Copying Files, page 4-15
- Using Tab Completion, page 4-16

## **Specifying File Systems**

The syntax for specifying a file system is <file system name>:[//server/]. Table 4-1 describes the file system syntax.

Table 4-1	File System	Syntax Co	mponents

File System Name	Server	Description
bootflash:	sup-active sup-local sup-1 module-1	Internal memory located on the active supervisor used for storing system images, configuration files, and other miscellaneous files. Virtual Firewall CLI defaults to the bootflash: file system.
	sup-standby sup-remote sup-2 module-2	Internal memory located on the standby supervisor used for storing system images, configuration files, and other miscellaneous files.
volatile:	_	Volatile random-access memory (VRAM) located on a supervisor module used for temporary or pending changes.

## **Identifying Your Current Working Directory**

You can display the directory name of your current location in the CLI.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI.

#### **PROCEDURE**

	Command	Purpose
Step 1	pwd	Displays the directory name of your current location in the CLI.
	Example: vsg# pwd	

This example shows how to display the directory name of your current location in the VSG CLI:

vsg# pwd
bootflash:

## **Changing Your Directory**

You can change directories in the CLI.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

- You are logged in to the CLI in any command mode.
- The Cisco VSG CLI defaults to the bootflash: file system.

Any file saved in the volatile: file system is erased when the VSG reboots.

#### **PROCEDURE**

	Command	Purpose
Step 1	pwd	Displays the directory name of your current CLI location.
	Example: vsg# pwd	
Step 2	cd directory name	Changes your CLI location to the specified directory.
	Example: vsg# cd bootflash:	

This example shows how to display the directory name of your current VSG CLI location and how to change your CLI location to the specified directory:

```
vsg# pwd
bootflash:
vsg# cd volatile:
vsg# pwd
volatile:
vsg#
```

# Listing the Files in a File System

You can display the contents of a directory or file.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### **PROCEDURE**

### Step Step 1

Command	Purpose
dir [directory   filename]	Displays the contents of a directory or file. Ending an
Example: vsg# dir TenantA/	argument with a slash indicates a directory and will display the contents of that directory.

This example shows how to display the contents of a directory:

vsg# dir los	t+found/				
49241	Jul 0	1	09:30:00	2008	diagclient_log.2613
12861	Jul 0	1	09:29:34	2008	diagmgr_log.2580
31	Jul 0	1	09:28:47	2008	dmesg
1811	Jul 0	1	09:28:58	2008	example_test.2633
89	Jul 0	1	09:28:58	2008	libdiag.2633
42136	Jul 0	1	16:34:34	2008	messages
65	Jul 0	1	09:29:00	2008	otm.log

```
741 Jul 01 09:29:07 2008 sal.log
87 Jul 01 09:28:50 2008 startupdebug
Usage for log://sup-local
51408896 bytes used
158306304 bytes free
209715200 bytes total
vsg#
```

## **Identifying Available File Systems for Copying Files**

You can identify the file systems that you can copy to or from.

#### **BEFORE YOU BEGIN**

Before using this procedure, you must know or do the following:

• You are logged in to the CLI in EXEC mode.

#### **PROCEDURE**

	Command	Purpose
Step 1	copy ?	Displays the source file systems available to the copy command.
	Example: vsg# copy ?	
Step 2	copy filename ?	Displays the destination file systems available to the copy
	Example: vsg# copy filename ?	command for a specific file.

This example shows how to display the source file systems available to the **copy** command.

```
vsg# copy ?
bootflash: Select source filesystem
core: Select source filesystem
debug: Select source filesystem
ftp: Select source filesystem
licenses Backup license files
log: Select source filesystem
nvram: Select source filesystem
running-config Copy running configuration to destination
scp: Select source filesystem
sftp: Select source filesystem
startup-config Copy startup configuration to destination
system: Select source filesystem
tftp: Select source filesystem
volatile: Select source filesystem
```

This example shows how to display the destination file systems available to the **copy** command for the specific file named.

#### vsg# copy filename ?

```
bootflash: Select destination filesystem debug: Select destination filesystem ftp: Select destination filesystem log: Select destination filesystem
```

modflash: Select destination filesystem
nvram: Select destination filesystem
running-config Copy from source to running configuration
scp: Select destination filesystem
sftp: Select destination filesystem
startup-config Copy from source to startup configuration
system: Select destination filesystem
tftp: Select destination filesystem
volatile: Select destination filesystem

## **Using Tab Completion**

You can have the CLI complete a partial file name in a command.

#### **BEFORE YOU BEGIN**

Before using this procedure, you must know or do the following:

• You are logged in to the CLI in EXEC mode.

#### **PROCEDURE**

	Command	Purpose
Step 1	<pre>show file filesystem name: partial filename <tab></tab></pre>	Completes the file name when Tab is pressed, if the characters you typed are unique to a single file.
	Example: vsg# show file bootflash:sanfrancisc	If not, the CLI lists a selection of file names that match the characters you typed.
	bootifasii. saiiffaiicise	You can then retype enough characters to make the file name unique; and CLI completes the file name for you.
Step 2	show file bootflash:c <tab></tab>	Completes the file name for you.
	Example: vsg# show file bootflash:c	

This example shows how you can display a selection of available files when you press Tab after you have typed enough characters that are unique to a file or set of files:

```
VSG# show file bootflash:nex<Tab>
bootflash:nexus-1000v-dplug-mzg.VSG1.0.1.bin
bootflash:nexus-1000v-kickstart-mzg.VSG1.0.1.bin
bootflash:nexus-1000v-mzg.VSG1.0.1.bin
bootflash:nexus-1000v-mzg.VSG1.0.2.bin
```

This example shows how a command is completed when you press the Tab key when you have already entered the first unique characters of a command.

```
vsg# show file bootflash:c<Tab>
----BEGIN RSA PRIVATE KEY----
MIICXgIBAAKBgQDSq93BrlHcg3bX1jXDMY5c9+yZSST3VhuQBqogvCPDGeLecA+j
...
vsg#
```

## **Copying and Backing Up Files**

You can copy a file, such as a configuration file, to save it or reuse it at another location. If your internal file systems are corrupted, you could potentially lose your configuration. Save and back up your configuration files periodically. Also, before installing or migrating to a new software configuration, back up the existing configuration files.

#### **BEFORE YOU BEGIN**

Before beginning this procedure, you must know or do the following:

- You are logged in to the CLI in any command mode.
- If you are copying to a remote location, make sure that your device has a route to the destination. Your device and the remote destination must be in the same subnetwork if you do not have a router or default gateway to route traffic between subnets.
- Using the **ping** command, make sure that your device has connectivity to the destination.
- Make sure that the source configuration file is in the correct directory on the remote server.
- Make sure that the permissions on the source file are set correctly. Permissions on the file should be set to world-read.

Use the **dir** command to ensure that enough space is available in the destination file system. If enough space is not available, use the **delete** command to remove unneeded files.

#### **PROCEDURE**

### Step 1

Command	Purpose
<pre>copy [source filesystem:] filename [destination filesystem:] filename</pre>	Copies a file from the specified source location to the specified destination location.
<pre>Example: vsg# copy system:running-config tftp://10.10.1.1./home/configs/vsg2.cfg</pre>	

This example shows how a file is copied from a specified source location and moved to a specified destination location:

```
vsg# copy system:running-config tftp://10.10.1.1/home/configs/vsg3-run.cfg
Enter vrf (If no input, current vrf 'default' is considered):
Trying to connect to tftp server......
Connection to Server Established.
TFTP put operation successful
vsg#
```

# **Creating a Directory**

You can create a directory at the current directory level or at a specified directory level.

#### **BEFORE YOU BEGIN**

Before beginning this procedure, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### **PROCEDURE**

	Command	Purpose
Step 1	<pre>mkdir {bootflash:   debug:   volatile:} directory-name</pre>	Creates a directory at the current directory level.
	Example: vsg# mkdir bootflash:new-directory	

This example shows how to create a directory called test in the bootflash: directory:

```
vsg# mkdir bootflash:test
vsg#
```

This example shows how to create a directory called test at the current directory level:

```
vsg# mkdir test
vsg#
```

# **Removing an Existing Directory**

You can remove an existing directory from the flash file system.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

- You are logged in to the CLI.
- This command is only valid on flash file systems.
- Before you can remove it, the directory must be empty.

#### **PROCEDURE**

# Command Purpose Step 1 rmdir {bootflash: | debug: | rolatile:} directory Example: rmdir bootflash:new-directory

This example shows how to remove the directory called test in the bootflash: directory:

```
vsg# rmdir bootflash:test
vsg#
```

This example shows how to remove the directory called test at the current directory level:

```
vsg# rmdir test
vsg#
```

# **Moving Files**

You can move a file from one location to another location.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

- You are logged in to the CLI.
- The copy does not complete if there is not enough space in the destination directory.

Step '

If a file with the same name already exists in the destination directory, that file is overwritten by the file that you move.

#### **PROCEDURE**

	Command	Purpose
1	<pre>move {source path and filename} {destination path and filename}</pre>	Moves a directory.
	<pre>Example: vsg# move bootflash:file1 bootflash:mystuff/file1</pre>	

This example shows how to move a file from one directory to another in the same file system:

```
{\tt vsg\#} \ \ \textbf{move bootflash:samplefile bootflash:mystorage/samplefile}
```

This example shows how to move a file from one directory to another in the current file system:

```
vsg\# move samplefile mystorage/samplefile
```

# **Deleting Files or Directories**

You can delete files or directories on a Flash memory device.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

- If you try to delete the configuration file or image specified by the CONFIG\_FILE or BOOTLDR environment variable, the system prompts you to confirm the deletion.
- If you try to delete the last valid system image specified in the BOOT environment variable, the system prompts you to confirm the deletion.

# Step 1 Command Purpose delete [bootflash: | debug: | log: | Deletes a specified file or directory and everything in the directory. Example: vsg# delete log:test-log

This example shows how to delete the named file from the current working directory:

```
vsg# delete bootflash:dns_config.cfg
```

This example shows how to delete the named directory and its contents:

```
vsg# delete log:my-log
```

# **Compressing Files**

You can compress (zip) a specified file using LZ77 coding.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI.

#### **PROCEDURE**

	Command	Purpose
Step 1	<pre>show command &gt; [path] filename</pre>	Directs show command output to a file.
	Example:	
	vsg# show pwd > pwdfile	
Step 2	dir	Displays the contents of the current directory, including the new
	Example:	file created in the first step.
	vsg# dir	
Step 3	gzip [path] filename	Compresses the specified file.
	Example: vsg# gzip bootflash:errorsfile	

This example shows how to display and then compress a specified file:

```
vsg\# show system internal sysmgr event-history errors > errorsfile
vsg# dir
   1480264

# **Uncompressing Files**

You can uncompress (unzip) a specified file that is compressed using LZ77 coding.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI.

	Command	Purpose
Step 1	gunzip [path] filename	Uncompresses the specified file.
	Example: vsg# gunzip bootflash:errorsfile.gz	
Step 2	dir	Displays the contents of a directory, including the newly uncompressed file.
	Example: vsg# dir	uncompressed me.

This example shows how to uncompress a specified file:

vsg# gunzip bootflash:errorsfile.gz					
vsg# dir bootflash:					
1480264	Nov	03	08:38:21	2001	1
77824	Dec	80	11:17:45	2001	accounting.log
4096	Nov 3	30	14:35:15	2001	core/
3220	Dec	09	16:33:05	2001	errorsfile
4096	Nov 3	30	14:35:15	2001	log/
16384	Nov	03	08:32:09	2001	lost+found/
7456	Dec	80	11:17:41	2001	mts.log

20126720	Nov	03	08:33:27	2001	nexus-1000v-kickstart-mzg.VSG1.0.1.bin
45985810	Dec	01	14:30:00	2001	nexus-1000v-mzg.VSG1.0.1.bin
46095447	Dec	07	11:32:00	2001	nexus-1000v-mzg.VSG1.0.396.bin
1714	Dec	80	11:17:33	2001	system.cfg.new
4096	Nov	03	08:33:54	2001	vdc_2/
4096	Nov	03	08:33:54	2001	vdc_3/
4096	Nov	03	08:33:54	2001	vdc_4/
Usage for bootflash://sup-local 631246848 bytes used 5772722176 bytes free 6403969024 bytes total					

# **Directing Command Output to a File**

You can direct command output to a file.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in any command mode.

	Command	Purpose
Step 1	<pre>show running-config &gt; [path   filename]</pre>	Directs the output of the command to a path and file
	<pre>Example: vsg# show running-config &gt; bootflash:vsg1-run.cfg</pre>	name.

This example shows how to direct the output of the command to the file vsg1-run.cfg in the volatile: directory:

vsg# show running-config > volatile:vsg1-run.cfg

This example shows how to direct the output of the command to the file vsg2-run.cfg in the bootflash: directory:

vsg# show running-config > bootflash:vsg2-run.cfg

# **Verifying a Configuration File Before Loading**

You can verify the integrity of an image before loading it.

The **copy** command can be used for both the system and kickstart images.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in any command mode.

#### **PROCEDURE**

	Command	Purpose	
Step 1	<pre>copy source path and file system:running-config</pre>	Copies the source file to the running configuration.	
	Example: vsg# copy tftp://10.10.1.1./home/configs/vsg1-run.cfg system:running-config		
Step 2	<pre>show version image [bootflash:   modflash:  volatile:]</pre>	Validates the specified image.	
	Example: vsg# show version image		

This example shows how to copy the source file to the running configuration:

 ${\tt vsg\#}~{\tt copy}~{\tt tftp://10.10.1.1/home/configs/vsg1-run.cfg}~{\tt system:running-config}$ 

This example shows how to validate the specified image:

# vsg# show version image bootflash:nexus-1000v-mz.VSG1.0.401.bin image name: nexus-1000v-mz.VSG1.0.401.bin bios: version unavailable system: version 4.2(1)VSG1(1) [build 4.2(1)VSG1(0.401)] compiled: 12/9/2010 2:00:00 [12/09/2010 15:20:50]

## **Reverting to a Previous Configuration**

You can recover your configuration from a previously saved version.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in any command mode.

Each time that a **copy running-config startup-config** command is used, a binary file is created and the ASCII file is updated. A valid binary configuration file reduces the overall boot time significantly. A binary file cannot be uploaded, but its contents can be used to overwrite the existing startup configuration. The **write erase** command clears the binary file.

#### **PROCEDURE**

	Command	Purpose
Step 1	<pre>copy running-config bootflash: {filename}</pre>	Reverts to a snapshot copy of a previously saved running configuration (binary file).
	Example: vsg# copy running-config bootflash:Jan24-running	
Step 2	<pre>copy bootflash: {filename} startup-configure</pre>	Reverts to a configuration copy that was previously saved in the bootflash: file system (ASCII file).
	<pre>Example: vsg# copy bootflash:my-configure startup-configure</pre>	

This example shows how to revert to a snapshot copy of a previously saved running configuration:

vsg # copy running-config bootflash:January03-Running

This example shows how to revert to a configuration copy that was previously saved in the bootflash: directory:

vsg# copy bootflash:my-configure startup-configure

# **Displaying Files**

This section describes how to display information about files and includes the following topics:

• Displaying File Contents, page 4-25

- Displaying Directory Contents, page 4-25
- Displaying File Checksums, page 4-26
- Displaying the Last Lines in a File, page 4-27

## **Displaying File Contents**

You can display the contents of a specified file.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in EXEC mode.

#### **PROCEDURE**

# Command Step 1 Show file [bootflash: | debug: | Displays the contents of the specified file. Example: vsg# show file bootflash:sample\_file.txt

The following example shows how to displays the contents of the specified file:

```
vsg# show file bootflash:sample_file.txt
security-profile sp1
  policy p1
rule r1
  action 10 permit
policy p1
  rule r1 order 10
```

## **Displaying Directory Contents**

You can display the contents of a directory or file system.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in EXEC mode.

	Command	Purpose
Step 1	pwd	Displays the current working directory.
	Example: vsg# pwd	
Step 2	dir	Displays the contents of the directory.
	Example: vsg# dir	

This example shows how to display your current working directory:

```
vsg# pwd
bootflash:
```

This example shows how to display the contents of a directory:

## **Displaying File Checksums**

You can display checksums for checking file integrity.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in EXEC mode.

#### **PROCEDURE**

# Step 1 Show file filename [cksum | md5sum] Example: vsg# show file bootflash:sample\_file.txt chksum Purpose Provides the checksum or Message-Digest Algorithm 5 (MD5) checksum of the file for comparison with the original file. MD5 is an electronic fingerprint for the file

This example shows how to provide the checksum or MD5 checksum of the file for comparison with the original file.

```
vsg# show file bootflash:sample_file.txt cksum 750206909 vsg#
```

This example shows how to provide the Message-Digest Algorithm 5 (MD5) checksum of the file:

```
vsg# show file bootflash:sample_file.txt md5sum
```

aa163ec1769b9156614c643c926023cf
vsq#

## **Displaying the Last Lines in a File**

You can display the last lines of a specified file.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in EXEC mode.

#### **PROCEDURE**

	Command	Purpose	
Step 1		Displays the requested number of lines from the end of the specified file.	
	Example:	The range for the number-of-lines argument is from 0 to 80.	

This example shows how to display the requested number of lines from the end of a specified file:

```
vsg# tail bootflash:errorsfile 5
(20) Event:E_DEBUG, length:34, at 171590 usecs after Tue Jul  1 09:29:05 2008
[102] main(326): stateless restart
vsg#
```

# **Displaying the Current User Access**

You can display all users currently accessing the Cisco VSG.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI in EXEC mode.

#### **PROCEDURE**

	Command	Description
Step 1	show users	Displays a list of users who are currently accessing the Cisco VSG.
	Example: vsg# show users	

This example shows how to display a list of users who are currently accessing the Cisco VSG:

```
vsg# show users
NAME LINE TIME IDLE PID COMMENT
```

admin	pts/0	Jul	1 04:40 03:29	2915 (	::ffff:64.103.145.136)
admin	pts/2	Jul	1 10:06 03:37	6413 (	::ffff:64.103.145.136)
admin	pts/3	Jul	1 13:49 .	8835 (	171.71.55.196)*
77CC#					

# **Sending a Message to Users**

You can send a message to all active users currently using the Cisco VSG.

#### **BEFORE YOU BEGIN**

Before using this command, you must know or do the following:

• You are logged in to the CLI.

#### **PROCEDURE**

	Command	Description		
Step 1 send {session device} line		Sends a message to users currently logged in to the system.		
	Example: vsg# send System Shutdown in 10 Minutes	<ul> <li>session: sends the message to a specified pts/tty device type.</li> <li>line is a message of up to 80 alphanumeric characters.</li> </ul>		

This example shows how to send a message to all users:

```
vsg# send Hello. Shutting down the system in 10 minutes. Broadcast Message from admin@vsg (/dev/pts/34) at 8:58 \dots Hello. Shutting down the system in 10 minutes. vsg#
```
