

Configuring Firewall Profiles and Policy Objects

This chapter contains the following sections:

- [Information About Policy Objects, page 1](#)
- [Configuring Service Firewall Logging, page 9](#)
- [Verifying the Cisco VSG Configuration, page 9](#)
- [Configuration Limits, page 10](#)

Information About Policy Objects

This section describes how you can use the Cisco Prime Network Services Controller (Prime NSC) to configure and manage the firewall policy objects on .

Note

You can configure only through Cisco PNSC. Currently, we do not support out of band configuration and management of firewall policy objects.

Information About Cisco VSG Policy Objects and Firewall Profiles

Cisco VSG Policy Object Configuration Prerequisites

Cisco VSG policy objects have the following prerequisites:

- You must have the Cisco Nexus 1000V Advanced Edition license installed on the Cisco Nexus 1000V Series switch. Starting with Cisco Nexus 2.1 Release, Cisco VSG license is bundled with Cisco Nexus 1000V Advanced Edition licenses.
- Create port profiles for the service and HA interfaces of Cisco VSG on the Virtual Supervisor Module (VSM).
- You have the Cisco VSG software installed and the basic installation completed.
- The data IP address and management IP addresses must be configured.

- You have the attribute details required for your security policies.
- You are logged in to the Cisco VSG CLI in EXEC mode.

Cisco VSG Configuration Guidelines and Limitations

The Cisco VSG policy objects and firewall policies have the following configuration guidelines and limitations:

- The Management VLAN must be extended to the Cloud and configured as system VLAN.
- The Service VLANs are configured on the uplink ports. (They are not required to be on the system VLAN.)
- Do not configure the same network IP address on the management and data interfaces (data0) of the Cisco VSG.

For any configuration and management tasks, the following requirements must be met:

- The Cisco VSG software must be operating with three network adapters. The network labels are as follows:
 - Service (Eth0) as the port-profile
 - Mgmt (Eth1) as the management VLAN
 - HA (Eth2) as the port-profile
- You have the Cisco VSG VM powered on and the data interface IP address (for data0) and management interface IP address configured.

See the Cisco VSG for InterCloud and Cisco Prime NSC Installation and Upgrade Guide, for details about assigning network labels to the network adapters.

Default Settings

Table 1: Default Parameter Settings for Cisco VSG

Parameters	Default
rule policy object	drop

Zones

A zone is a logical group of VMs or hosts. Zones simplify policy writing by allowing users to write policies based on zone attributes using zone names. The zone definitions map the VMs to the zones. The logical group definition can be based on the attributes associated with a VM, such as VM attributes. Zone definitions can be written as condition-based subnet and endpoint IP addresses.

Because zones and object groups can be shared between various rules with different directions, the attributes used in a zone should not have a directional sense and must be neutral.

Zone Example

This example shows how to display a zone in your network:

```
vsg# show running-config zone zone1
zone zone1
cond-match-criteria: match-any
condition 1 net.ip-address eq 1.1.1.1
condition 2 net.port eq 80
```

Object Groups

An object group is a set of conditions relevant to an attribute. Because object groups and zones can be shared between various rules with different directions, the attributes used in an object group condition should not have a directional sense and must be neutral. An object group is a secondary policy object that assists in writing firewall rules. A rule condition can refer to an object group by using an operator.

Object Group Example

This example shows how to display the object groups in your network:

```
vsg# show running-config object-group g1
object-group g1 net.port
match 10 in-range protocol 6 port 10 30
match 11 eq protocol 6 port 21 inspect ftp
```

Rules

Firewall rules can consist of multiple conditions and actions. Rules can be defined in a policy as a condition for filtering the traffic. The policy engine uses the policy as a configuration that filters the network traffic that is received on the . The policy engine uses two types of condition matching models for filtering the network traffic:

AND Model: A rule is set to matched when all the attributes in a rule match.

OR model: The attributes are classified into five different types of columns. For a rule to be true, at least one condition in each column must be true. The five columns in an OR model are:

- Source column: Attribute to identify source host.
- Destination column: Attribute to identify destination host.
- Service column: Attribute to identify service at the destination host.
- Ether type column: Attribute to identify link level protocol.
- Source port column: Attribute to identify source port.

Rule Example

This example shows how to display the rule in your network:

```
vsg# show running-config rule r2
rule r2
cond-match-criteria: match-all
dst-attributes
condition 10 dst.zone.name eq z1@r2
service/protocol-attribute
```

```
condition 11 net.service eq protocol 6 port 21 inspect ftp
action permit
```

Policies

A policy enforces network traffic on a . A key component operating on the is the policy engine. The policy engine takes the policy as a configuration and executes it when enforced against the network traffic that is received on the . A policy is constructed by using the following set of policy objects:

- Rules
- Conditions
- Actions
- Objects groups
- Zones

A policy is bound to a by using a set of indirect associations. The security administrator can configure a security profile and then refer to a policy name within the security profile. The security profile is associated with a port profile that has a reference to a .

Policy Examples

This example shows how the policy is expressed in the **show running-config** command output:

```
vsg# show running-config policy p2@root/T1
policy p2@root/T1
  rule r2 order 10
```

This example shows how conditions are expressed in the **show running-config** command output:

```
condition 1 dst.net.ip-address eq 2.2.2.2
condition 2 src.net.ip-address eq 1.1.1.1
```

This example shows how an action is expressed in the **show running-config** command output:

```
action permit
```

Cisco Virtual Security Gateway Attributes

This section describes Cisco VSG attributes.

Information About Attribute Name Notations

Directional Attributes

A firewall policy is direction sensitive with regard to incoming or outgoing packets. An attribute in a rule condition requires that you have specified if the attribute is relevant to a source or a destination. The prefixes `src.`, `dst.`, or an attribute name are used to provide the sense of direction.

Neutral Attributes

Because object groups and zones can be shared between various rules with different directions, the attributes used in a zone should not have a directional sense. Attributes without a directional sense (that do not provide a direction prefix such as src. or dst.) are called neutral attributes.

Two rule conditions with different directions can share the same object group definition. A neutral attribute and net.ip-address used in the object group can be associated with the directional attributes, such as src.net.ip-address and dst.net.ip-address, used in the different rules.

Attribute Classes

Attributes are used in configuring policy rules and conditions, or zone definitions.

Neutral Attributes

Because object groups and zones can be shared between various rules with different directions, the attributes used in a zone should not have a directional sense. Attributes without a directional sense (that do not provide a direction prefix such as src. or dst.) are called neutral attributes.

Two rule conditions with different directions can share the same object group definition. A neutral attribute and net.ip-address used in the object group can be associated with the directional attributes, such as src.net.ip-address and dst.net.ip-address, used in the different rules.

VM Attributes

The VM attributes are related to the VM infrastructure and include the following classes of VM attributes:

- Virtual infrastructure attributes—These attributes are obtained from the and are mapped to names.
- Port profile attributes—These attributes are associated with port profiles.
- Custom attributes—These attributes can be configured under a service profile.

The following table describes the VM attributes that are supported by Cisco VSG.

Description	Name
Name of VM	src.vm.name dst.vm.name vm.name Note vm.name is a neutral attribute.
Name of host parent (host)	src.vm.host-name dst.vm.host-name vm.host-name Note vm.host-name is a neutral attribute.

Description	Name
Full name of OS guest (includes the version)	src.vm.os-fullname dst.vm.os-fullname vm.os-fullname Note vm.os-fullname is a neutral attribute.
Name of port profile associated with specific vNIC	src.vm.portprofile-name dst.vm.portprofile-name vm.portprofile-name Note vm.portprofile-name is a neutral attribute.
Custom attributes from security profile of associated port group. Note For every unique custom-attribute xxx, the synthesized attribute name is src.vm.custom.xxx or dst.vm.custom.xxx. The policy uses the synthesized attribute name.	src.vm.custom.xxx dst.vm.custom.xxx vm.custom.xxx Note vm.custom.xxx is a neutral attribute.

Custom VM attributes are user-defined attributes that can be configured under a service profile.

This example shows how to verify the VM attributes on a Cisco VSG:

```
firewall(config)# show vsg vm
VM uuid      : 852a1ff3-149d-4c75-adfa-c75e0d583d37
VM attributes :
  name                : vm
  os-fullname         : windows server 2012 r2 datacenter
  os-hostname        : vm
```

Zone(s) :

Zone Attributes

Table 2: Zone Attributes Supported by Cisco VSG

Description	Name
Zone name. This is a multi-valued attribute and can belong to multiple zones at the same time.	src.zone.name dst.zone.name zone.name Note zone.name is a neutral attribute.

Security Profiles

The security profile defines custom attributes that can be used to write policies. All the VMs tagged with a given port profile inherit the firewall policies and custom attributes defined in the security profile associated with that port profile. Each custom attribute is configured as a name value pair such as state = CA.

This example shows how to verify the security profile on a Cisco VSG:

```
vsg_d3338(config-nsc-policy-agent)# show vsg security-profile table
-----
Security-Profile Name VNSP ID Policy Name
-----
default@root 1 default@root
sp10@root/tenant_d3338 9 ps9@root/tenant_d3338
sp9@root/tenant_d3338 10 ps9@root/tenant_d3338
sp2@root/tenant_d3338 11 ps1@root/tenant_d3338
sp1@root/tenant_d3338 12 ps1@root/tenant_d3338
```

This example shows how to verify the security profile on a Cisco VSG:

```
vsg_d3338(config-nsc-policy-agent)# show vsg security-profile
VNSP : sp10@root/tenant_d3338
VNSP id : 9
Policy Name : ps9@root/tenant_d3338
Policy id : 3
Custom attributes :
  vnsporg : root/tenant_d3338
VNSP : default@root
VNSP id : 1
Policy Name : default@root
Policy id : 1
Custom attributes :
  vnsporg : root
VNSP : sp1@root/tenant_d3338
VNSP id : 12
Policy Name : ps1@root/tenant_d3338
Policy id : 2
Custom attributes :
  vnsporg : root/tenant_d3338
  location : losangeles
  color9 : test9
  color8 : test8
  color7 : test7
  color6 : test6
  color5 : test5
  color4 : test4
  color3 : test3
  color2 : test2
  color13 : test13
  color12 : test12
  color11 : test11
  color10 : test10
  color1 : test1
  color : red
VNSP : sp2@root/tenant_d3338
VNSP id : 11
Policy Name : ps1@root/tenant_d3338
Policy id : 2
Custom attributes :
  vnsporg : root/tenant_d3338
  location : sanjose
  color : blue
VNSP : sp9@root/tenant_d3338
VNSP id : 10
Policy Name : ps9@root/tenant_d3338
Policy id : 3
```

```
Custom attributes :
  vnsporg : root/tenant_d3338
```

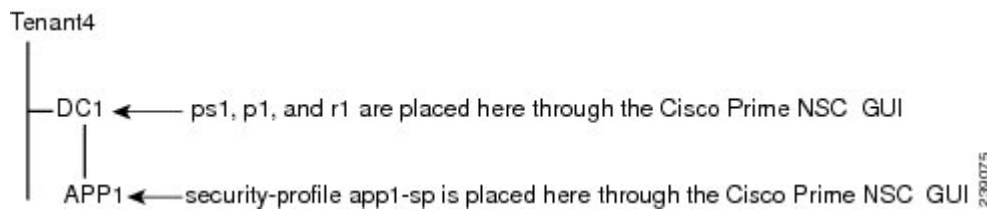

Viewing Security Profiles and Policies on the Cisco Prime NSC and the Cisco VSG

The Cisco Prime NSC GUI provides a view of the Cisco VSG security policy objects. The policy objects shown in the Cisco Prime NSC GUI are not necessarily shown in the same organizational path location as they appear in the Cisco VSG CLI when you enter the **show running-config** command.

For example, in the Cisco Prime NSC GUI, if the virtual data center DC1 is under the tenant and the application APP1 is under DC1, the vnsp app1-sp in the APP1 level is pointing to the policy set ps1 at the DC level.

The following figure shows the Cisco Prime NSC GUI organization structure.

Figure 1: Cisco Prime NSC Organizational Hierarchy for a Tenant, Data Center, and Application

```
security-profile app1-sp@root/tenant4/DC1/APP1
policy ps1@root/tenant4/DC1/APP1
```

The output of the **show running-config** command shows that the policy set and its objects are resolved from the APP1 level where the security profile is defined. The actual location of the objects in the Cisco Prime NSC GUI is at the DC1 level.

```
policy ps1@root/tenant4/DC1/APP1
rule p1/r1@root/tenant4/DC1/APP1 order 101
```

The policy object DNs that are shown in the Cisco VSG **show running-config** command output are shown with a DN relative to where they are resolved from. The policy object DNs are not where the actual policy objects are in the Cisco Prime NSC organizational hierarchy.

However, security profiles are shown with the DN where the actual security profile is created on the Cisco Prime NSC organizational hierarchy.

Policy objects are resolved upwards from where the security profile is located in the Cisco Prime NSC organizational hierarchy.

In the following example, the Cisco VSG is configured with the following specifications:

- The security profile (VNSP) sp1 has policy-set ps1 in which there is a policy p1 that includes a rule, r1.
- The policy-set ps1 is located at root in the organization tree on the Cisco Prime NSC.
- The policy p1 is located at root in the organization tree on the Cisco Prime NSC.
- The rule r1 is placed in the policy p1 on the Cisco Prime NSC (the Cisco Prime NSC does not allow you to create a rule object in and of itself).
- The security profile sp1 is placed in tenant_d3337/dc1 on the Cisco Prime NSC.

All Cisco VSGs in the tenant_d3337 have the following **show running-config** command output (this configuration is replicated to all Cisco VSGs in the leaf path):

```
security-profile sp1@root/tenant_d3337/dc1
policy ps1@root/tenant_d3337/dc1

policy pl@root/tenant_d3337/dc1
rule pl/r1@root/tenant_d3337/dc1 order 101
```

**Note**

The policy objects above do not actually exist at the DC1 level of the organization tree on the Cisco Prime NSC but are resolved from that location in the Cisco Prime NSC organization tree.

Configuring Service Firewall Logging

See the “Enabling Global Policy-Engine Logging” section of the .

Verifying the Cisco VSG Configuration

To display the Cisco VSG configuration, use the **show running-config** command.

```
vsg# show running-config

!Command: show running-config
