The following example collects the TCP flags from a flow:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect transport tcp flags
```

collect routing next-hop address

To configure the next-hop address value as a non-key field and enable collecting information regarding the next hop from the flows, use the **collect routing next-hop address** command in flow record configuration mode. To disable the use of one or more of the routing attributes as a non-key field for a flow record, use the **no** form of this command.

```
collect routing next-hop address { ipv4 | ipv6 }
no collect routing next-hop address { ipv4 | ipv6 }
```

| Syntax Description | | |
|--------------------|-------------|---|
| | ipv4 | Specifies that the next-hop address value is an IPv4 address. |
| | ipv6 | Specifies that the next-hop address value is an IPv6 address. |

Command Default Next hop address value is not configured as a non-key field.

Command Modes Flow record configuration (config-flow-record)

| Command History | Release | Modification |
|-----------------|-------------------------------|---|
| | Cisco IOS XE Amsterdam 17.2.1 | This command was introduced. |
| | Cisco IOS XE Amsterdam 17.3.1 | The ipv6 keyword was introduced. |

Usage Guidelines The **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases the values for non-key fields are taken from only the first packet in the flow.

Examples The following example shows how to configure the next-hop address value as a non-key field:

```
Device> enable
Device# configure terminal
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect routing next-hop address ipv4
```

| Related Commands | Command | Description |
|------------------|--------------------|--|
| | flow record | Creates a flow record, and enters Flexible NetFlow flow record configuration mode. |

datalink flow monitor

To apply a Flexible NetFlow flow monitor to an interface, use the **datalink flow monitor** command in interface configuration mode. To disable a Flexible NetFlow flow monitor, use the **no** form of this command.

datalink flow monitor *monitor-name* **sampler** *sampler-name* **input**
no datalink flow monitor *monitor-name* **sampler** *sampler-name* **input**

| Syntax Description | | |
|--------------------|------------------------------------|---|
| | <i>monitor-name</i> | Name of the flow monitor to apply to the interface. |
| | sampler <i>sampler-name</i> | Enables the specified flow sampler for the flow monitor. |
| | input | Monitors traffic that the switch receives on the interface. |

Command Default A flow monitor is not enabled.

Command Modes Interface configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Before you apply a flow monitor to an interface with the **datalink flow monitor** command, you must have already created the flow monitor using the **flow monitor** global configuration command and the flow sampler using the **sampler** global configuration command.

To enable a flow sampler for the flow monitor, you must have already created the sampler.

Note The **datalink flow monitor** command only monitors non-IPv4 and non-IPv6 traffic. To monitor IPv4 traffic, use the **ip flow monitor** command. To monitor IPv6 traffic, use the **ipv6 flow monitor** command.

This example shows how to enable Flexible NetFlow datalink monitoring on an interface:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# datalink flow monitor FLOW-MONITOR-1 sampler FLOW-SAMPLER-1 input
```

debug flow exporter

To enable debugging output for Flexible Netflow flow exporters, use the **debug flow exporter** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug flow exporter [[name] exporter-name] [{error | event | packets number}]
no debug flow exporter [[name] exporter-name] [{error | event | packets number}]
```

Syntax Description

| | |
|----------------------|--|
| name | (Optional) Specifies the name of a flow exporter. |
| <i>exporter-name</i> | (Optional) The name of a flow exporter that was previously configured. |
| error | (Optional) Enables debugging for flow exporter errors. |
| event | (Optional) Enables debugging for flow exporter events. |
| packets | (Optional) Enables packet-level debugging for flow exporters. |
| <i>number</i> | (Optional) The number of packets to debug for packet-level debugging of flow exporters. The range is 1 to 65535. |

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example indicates that a flow exporter packet has been queued for process send:

```
Device# debug flow exporter
May 21 21:29:12.603: FLOW EXP: Packet queued for process send
```

debug flow monitor

To enable debugging output for Flexible NetFlow flow monitors, use the **debug flow monitor** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug flow monitor [{error | [name] monitor-name [{cache [error] | error | packets packets}]}]
no debug flow monitor [{error | [name] monitor-name [{cache [error] | error | packets packets}]}]
```

Syntax Description

| | |
|---------------------|---|
| error | (Optional) Enables debugging for flow monitor errors for all flow monitors or for the specified flow monitor. |
| name | (Optional) Specifies the name of a flow monitor. |
| <i>monitor-name</i> | (Optional) Name of a flow monitor that was previously configured. |
| cache | (Optional) Enables debugging for the flow monitor cache. |
| cache error | (Optional) Enables debugging for flow monitor cache errors. |
| packets | (Optional) Enables packet-level debugging for flow monitors. |
| <i>packets</i> | (Optional) Number of packets to debug for packet-level debugging of flow monitors. The range is 1 to 65535. |

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example shows that the cache for FLOW-MONITOR-1 was deleted:

```
Device# debug flow monitor FLOW-MONITOR-1 cache
May 21 21:53:02.839: FLOW MON: 'FLOW-MONITOR-1' deleted cache
```

debug flow record

To enable debugging output for Flexible NetFlow flow records, use the **debug flow record** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug flow record [{{name}} record-name | options {sampler-table} | [{{detailed | error}}]]
no debug flow record [{{name}} record-name | options {sampler-table} | [{{detailed | error}}]]
```

Syntax Description

| | |
|----------------------|---|
| name | (Optional) Specifies the name of a flow record. |
| <i>record-name</i> | (Optional) Name of a user-defined flow record that was previously configured. |
| options | (Optional) Includes information on other flow record options. |
| sampler-table | (Optional) Includes information on the sampler tables. |
| detailed | (Optional) Displays detailed information. |
| error | (Optional) Displays errors only. |

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example enables debugging for the flow record:

```
Device# debug flow record FLOW-record-1
```

debug sampler

To enable debugging output for Flexible NetFlow samplers, use the **debug sampler** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

```
debug sampler [{detailed | error | [name] sampler-name [{detailed | error | sampling samples}]}]
no debug sampler [{detailed | error | [name] sampler-name [{detailed | error | sampling}]}]
```

| Syntax Description | Parameter | Description |
|--------------------|--------------------------------|---|
| | detailed | (Optional) Enables detailed debugging for sampler elements. |
| | error | (Optional) Enables debugging for sampler errors. |
| | name | (Optional) Specifies the name of a sampler. |
| | <i>sampler-name</i> | (Optional) Name of a sampler that was previously configured. |
| | sampling <i>samples</i> | (Optional) Enables debugging for sampling and specifies the number of samples to debug. |

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following sample output shows that the debug process has obtained the ID for the sampler named SAMPLER-1:

```
Device# debug sampler detailed
*May 28 04:14:30.883: Sampler: Sampler(SAMPLER-1: flow monitor FLOW-MONITOR-1 (ip,Et1/0,O)
  get ID succeeded:1
*May 28 04:14:30.971: Sampler: Sampler(SAMPLER-1: flow monitor FLOW-MONITOR-1 (ip,Et0/0,I)
  get ID succeeded:1
```

description

To configure a description for a flow monitor, flow exporter, or flow record, use the **description** command in the appropriate configuration mode. To remove a description, use the **no** form of this command.

description *description*
no description *description*

Syntax Description

description Text string that describes the flow monitor, flow exporter, or flow record.

Command Default

The default description for a flow sampler, flow monitor, flow exporter, or flow record is "User defined."

Command Modes

The following command modes are supported:

Flow exporter configuration

Flow monitor configuration

Flow record configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

To return this command to its default setting, use the **no description** or **default description** command in the appropriate configuration mode.

The following example configures a description for a flow monitor:

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# description Monitors traffic to 172.16.0.1 255.255.0.0
```

description (ERSPAN)

To describe an Encapsulated Remote Switched Port Analyzer (ERSPAN) source session, use the **description** command in ERSPAN monitor source session configuration mode. To remove a description, use the **no** form of this command.

description *description*
no description

Syntax Description *description* Describes the properties for this session.

Command Default Description is not configured.

Command Modes ERSPAN monitor source session configuration mode (config-mon-erspan-src)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The *description* argument can be up to 240 characters.

Examples The following example shows how to describe an ERSPAN source session:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# description source1
```

| Related Commands | Command | Description |
|------------------|-----------------------------|--|
| | monitor session type | Configures a local ERSPAN source or destination session. |

destination (ERSPAN)

To configure an Encapsulated Remote Switched Port Analyzer (ERSPAN) source session destination and specify destination properties, use the **destination** command in ERSPAN monitor source session configuration mode. To remove a destination session, use the **no** form of this command.

destination
no destination

Syntax Description This command has no arguments or keywords.

Command Default A source session destination is not configured.

Command Modes ERSPAN monitor source session configuration mode (config-mon-erspan-src)

| Command History | Release | Modification |
|-----------------|-------------------------------|--|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Amsterdam 17.1.1 | The ipv6 keyword was added in the source session destination configuration mode, for IPv6 ERSPAN support. |

Usage Guidelines ERSPAN traffic is GRE-encapsulated SPAN traffic that can only be processed by an ERSPAN destination session.

After you enter **destination** command, the command mode changes from monitor source session configuration mode (config-mon-erspan-src) to source session destination configuration mode (config-mon-erspan-src-dst). In this mode, enter a question mark (?) at the system prompt to see the list of commands that are available:

| | |
|-----------------------------------|--|
| erspan-id <i>erspan-ID</i> | Configures the ID used by the destination session to identify the ERSPAN traffic. Valid values range from 1 to 1023. |
| exit | Exits monitor ERSPAN destination session source property mode. |

| | |
|---|---|
| <pre>ip { address <i>ipv4-address</i> dscp <i>dscp-value</i> ttl <i>ttl-value</i> }</pre> | <p>Specifies IP properties. You can configure the following options:</p> <ul style="list-style-type: none"> • address <i>ipv4-address</i>: Configures the IP address for the ERSPAN destination sessions. All ERSPAN source session (maximum 8) destination IP addresses need not be same. <p>The ERSPAN source session destination IP address, which is configured on an interface on the destination switch, is the source of traffic that an ERSPAN destination session sends to destination ports. Configure the same address in both the source and destination sessions.</p> <ul style="list-style-type: none"> • dscp <i>dscp-value</i>: Configures the Differentiated Services Code Point (DSCP) values for packets in the ERSPAN traffic. Valid values are from 0 to 63. <p>To remove the dscp values, use the no form of this command.</p> <ul style="list-style-type: none"> • ttl <i>ttl-value</i>: Configures the Time to Live (TTL) values for packets in the ERSPAN traffic. Valid values are from 2 to 255. <p>To remove the TTL values, use the no form of this command.</p> |
| <pre>ipv6 { address <i>ipv6-address</i> dscp <i>dscp-value</i> flow-label ttl <i>ttl-value</i> }</pre> | <p>Specifies IPv6 properties. You can configure the following options:</p> <ul style="list-style-type: none"> • address <i>ipv6-address</i>: Configures the IPv6 address for the ERSPAN destination sessions. All ERSPAN source session (maximum 8) destination IPv6 address need not be same. <p>The ERSPAN source session destination IPv6 address, which is configured on an interface on the destination switch, is the source of traffic that an ERSPAN destination session sends to destination ports. Configure the same address in both the source and destination sessions.</p> <ul style="list-style-type: none"> • dscp <i>dscp-value</i>: Configures the Differentiated Services Code Point (DSCP) values for packets in the ERSPAN traffic. Valid values are from 0 to 63. <p>To remove the dscp values, use the no form of this command.</p> <ul style="list-style-type: none"> • flow-label: Configures the flow-label. Valid values are from 0 to 1048575. <ul style="list-style-type: none"> • ttl <i>ttl-value</i>: Configures the Time to Live (TTL) values for packets in the ERSPAN traffic. Valid values are from 2 to 255. <p>To remove the TTL values, use the no form of this command.</p> |
| <pre>mtu <i>bytes</i></pre> | <p>Specifies the maximum transmission unit (MTU) size for ERSPAN truncation. The default value is 9000 bytes.</p> |
| <pre>origin { ip address <i>ip-address</i> ipv6 address <i>ipv6-address</i> }</pre> | <p>Configures the source of the ERSPAN traffic. You can enter an IPv4 address or an IPv6 address.</p> |
| <pre>vrf <i>vrf-id</i></pre> | <p>Configures virtual routing and forwarding (VRF) in the destination session. Enter the VRF ID.</p> |

ERSPAN traffic is GRE-encapsulated SPAN traffic that can only be processed by an ERSPAN destination session.

Examples

The following examples show how to configure an ERSPAN source session destination, enter the ERSPAN monitor destination session configuration mode, and configure the various properties.

The following example specifies the destination property **ip**:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ip address 10.1.1.1
Device(config-mon-erspan-src-dst)#
```

The following example shows how to configure an ERSPAN ID for a destination session:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# erspan-id 3
```

The following example shows how to configure DSCP value for ERSPAN traffic:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ip dscp 15
```

The following example shows how to configure TTL value for ERSPAN traffic:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ip ttl 32
```

The following example specifies the destination property **ipv6**:

```
Device(config)# monitor session 3 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ipv6 address 2001:DB8::1
Device(config-mon-erspan-src-dst)#
```

The following example shows how to configure DSCP value for ERSPAN traffic IPv6:

```
Device(config)# monitor session 3 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ipv6 dscp 10
```

The following example shows how to configure flow-label value for ERSPAN traffic IPv6:

```
Device(config)# monitor session 3 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ipv6 flow-label 6
```

The following example shows how to configure TTL value for ERSPAN traffic IPv6:

```
Device(config)# monitor session 3 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# ipv6 ttl 32
```

The following example shows how to specify an MTU of 1000 bytes:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# mtu 1000
```

The following example shows how to configure an IP address for an ERSPAN source session:

```
Switch(config)# monitor session 2 type erspan-source
Switch(config-mon-erspan-src)# destination
Switch(config-mon-erspan-src-dst)# origin ip address 192.0.2.1
```

The following example shows how to configure an IPv6 address for an ERSPAN source session:

```
Switch(config)# monitor session 3 type erspan-source
Switch(config-mon-erspan-src)# destination
Switch(config-mon-erspan-src-dst)# origin ipv6 address 2001:DB8:1::1
```

The following example shows how to configure VRF in the destination session:

```
Switch(config)# monitor session 3 type erspan-source
Switch(config-mon-erspan-src)# destination
Switch(config-mon-erspan-src-dst)# vrf vrfexample
```

The following sample output from the **show monitor session all** displays different IP addresses for source session destinations:

```
Device# show monitor session all

Session 1
-----
Type : ERSPAN Source Session
Status : Admin Disabled
Description : session1
Destination IP Address : 10.1.1.1

Session 2
-----
Type : ERSPAN Source Session
Status : Admin Disabled
Description : session2
Destination IP Address : 192.0.2.1

Session 3
-----
Type : ERSPAN Source Session
Status : Admin Disabled
Description : session3
Destination IP Address : 198.51.100.1

Session 4
-----
```

destination (ERSPAN)

```
Type : ERSPAN Source Session
Status : Admin Disabled
Description : session4
Destination IP Address : 203.0.113.1
```

```
Session 5
-----
Type : ERSPAN Source Session
Status : Admin Disabled
Description : session5
Destination IP Address : 209.165.200.225
```

Related Commands

| Command | Description |
|----------------------------|--|
| monitorsession type | Configures a local ERSPAN source or destination session. |

destination

To configure an export destination for a flow exporter, use the **destination** command in flow exporter configuration mode. To remove an export destination for a flow exporter, use the **no** form of this command.

destination *{hostnameip-address}*
no destination *{hostnameip-address}*

Syntax Description

hostname Hostname of the device to which you want to send the NetFlow information.

ip-address IPv4 address of the workstation to which you want to send the NetFlow information.

Command Default

An export destination is not configured.

Command Modes

Flow exporter configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Each flow exporter can have only one destination address or hostname.

When you configure a hostname instead of the IP address for the device, the hostname is resolved immediately and the IPv4 address is stored in the running configuration. If the hostname-to-IP-address mapping that was used for the original Domain Name System (DNS) name resolution changes dynamically on the DNS server, the device does not detect this, and the exported data continues to be sent to the original IP address, resulting in a loss of data.

To return this command to its default setting, use the **no destination** or **default destination** command in flow exporter configuration mode.

The following example shows how to configure the networking device to export the Flexible NetFlow cache entry to a destination system:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# destination 10.0.0.4
```

dscp

To configure a differentiated services code point (DSCP) value for flow exporter datagrams, use the **dscp** command in flow exporter configuration mode. To remove a DSCP value for flow exporter datagrams, use the **no** form of this command.

```
dscp dscp
no dscp dscp
```

| | |
|---------------------------|--|
| Syntax Description | <i>dscp</i> DSCP to be used in the DSCP field in exported datagrams. The range is 0 to 63. The default is 0. |
|---------------------------|--|

| | |
|------------------------|---|
| Command Default | The differentiated services code point (DSCP) value is 0. |
|------------------------|---|

| | |
|----------------------|-----------------------------|
| Command Modes | Flow exporter configuration |
|----------------------|-----------------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | To return this command to its default setting, use the no dscp or default dscp flow exporter configuration command. |
|-------------------------|---|

The following example sets 22 as the value of the DSCP field in exported datagrams:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# dscp 22
```

et-analytics

To enter the global et-analytics configuration mode, use the **et-analytics** command in the global configuration mode.

et-analytics

| | | |
|---------------------------|-------------------------------|---|
| Syntax Description | et-analytics | Enter the global et-analytics configuration mode. |
| Command Default | Disabled. | |
| Command Modes | Global configuration (config) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example:

The following example shows how to enter the et-analytics configuration mode:

```
Device>enable
Device#configure terminal
Device(config)# et-analytics
```

et-analytics enable

To enable et-analytics configuration on a particular interface, use the **et-analytics enable** command in the interface configuration mode. To disable et-analytics, use the **no** form of the command.

et-analytics enable
no et-analytics enable

| | | |
|---------------------------|-------------------------------------|--|
| Syntax Description | et-analytics enable | Enables et-analytics on a particular interface.. |
| Command Default | Disabled. | |
| Command Modes | Interface configuration (config-if) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example:

The following example shows how to enable et-analytics on interface GigabitEthernet1/0/2.:

```
Device>enable
Device#configure terminal
Device(config)# interface gi1/0/2
Device(config-if)# et-analytics enable
```

event manager applet

To register an applet with the Embedded Event Manager (EEM) and to enter applet configuration mode, use the **event manager applet** command in global configuration mode. To unregister the applet, use the **no** form of this command.

```
event manager applet applet-name [authorization bypass] [class class-options] [trap]
no event manager applet applet-name [authorization bypass] [class class-options] [trap]
```

| Syntax Description | |
|----------------------|---|
| <i>applet-name</i> | Name of the applet file. |
| authorization | (Optional) Specifies AAA authorization type for applet. |
| bypass | (Optional) Specifies EEM AAA authorization type bypass. |
| class | (Optional) Specifies the EEM policy class. |
| <i>class-options</i> | (Optional) The EEM policy class. You can specify either one of the following: <ul style="list-style-type: none"> • <i>class-letter-</i> Letter from A to Z that identifies each policy class. You can specify any one <i>class-letter</i>. • default --Specifies the policies registered with the default class. |
| trap | (Optional) Generates a Simple Network Management Protocol (SNMP) trap when the policy is triggered. |

Command Default No EEM applets are registered.

Command Modes Global configuration (config)

Command History

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines An EEM applet is a concise method for defining event screening criteria and the actions to be taken when that event occurs.

Only one event configuration command is allowed within an applet configuration. When applet configuration submode is exited and no event command is present, a warning is displayed stating that no event is associated with this applet. If no event is specified, this applet is not considered registered and the applet is not displayed. When no action is associated with this applet, events are still triggered but no actions are performed. Multiple action applet configuration commands are allowed within an applet configuration. Use the **show event manager policy registered** command to display a list of registered applets.

Before modifying an EEM applet, use the **no** form of this command to unregister the applet because the existing applet is not replaced until you exit applet configuration mode. While you are in applet configuration mode modifying the applet, the existing applet may be executing. When you exit applet configuration mode, the old applet is unregistered and the new version is registered.

Note Do not attempt making any partial modification. EEM does not support partial changes to already registered policies. EEM policy has to be always unregistered before registering again with changes.

Action configuration commands are uniquely identified using the *label* argument, which can be any string value. Actions are sorted in ascending alphanumeric key sequence using the *label* argument as the sort key and are run using this sequence.

The EEM schedules and runs policies on the basis of an event specification that is contained within the policy itself. When applet configuration mode is exited, EEM examines the event and action commands that are entered and registers the applet to be run when a specified event occurs.

The EEM policies will be assigned a class when **class** *class-letter* is specified when they are registered. EEM policies registered without a class will be assigned to the **default** class. Threads that have **default** as the class will service the default class when the thread is available for work. Threads that are assigned specific class letters will service any policy with a matching class letter when the thread is available for work.

If there is no EEM execution thread available to run the policy in the specified class and a scheduler rule for the class is configured, the policy will wait until a thread of that class is available for execution. Synchronous policies that are triggered from the same input event should be scheduled in the same execution thread. Policies will be queued in a separate queue for each class using the *queue_priority* as the queuing order.

When a policy is triggered and if AAA is configured it will contact the AAA server for authorization. Using the **authorization bypass** keyword combination, you can skip to contact the AAA server and run the policy immediately. EEM stores AAA bypassed policy names in a list. This list is checked when policies are triggered. If a match is found, AAA authorization is bypassed.

To avoid authorization for commands configured through the EEM policy, EEM will use named method lists, which AAA provides. These named method lists can be configured to have no command authorization.

The following is a sample AAA configuration.

This configuration assumes a TACACS+ server at 192.168.10.1 port 10000. If the TACACS+ server is not enabled, configuration commands are permitted on the console; however, EEM policy and applet CLI interactions will fail.

```
enable password lab
aaa new-model
tacacs-server host 128.107.164.152 port 10000
tacacs-server key cisco
aaa authentication login consoleline none
aaa authorization exec consoleline none
aaa authorization commands 1 consoleline none
aaa authorization commands 15 consoleline none
line con 0
  exec-timeout 0 0
  login authentication consoleline
aaa authentication login default group tacacs+ enable
aaa authorization exec default group tacacs+
aaa authorization commands 1 default group tacacs+
aaa authorization commands 15 default group tacacs+
```

The **authorization**, **class** and **trap** keywords can be used in any combination.

Examples

The following example shows an EEM applet called IPSLAping1 being registered to run when there is an exact match on the value of a specified SNMP object ID that represents a successful IP SLA

ICMP echo operation (this is equivalent to a **ping** command). Four actions are triggered when the echo operation fails, and event monitoring is disabled until after the second failure. A message that the ICMP echo operation to a server failed is sent to syslog, an SNMP trap is generated, EEM publishes an application-specific event, and a counter called IPSLA1F is incremented by a value of one.

```
Router(config)# event manager applet IPSLAping1
Router(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.42.1.2.9.1.6.4 get-type exact
entry-op eq entry-val 1 exit-op eq exit-val 2 poll-interval 5
Router(config-applet)# action 1.0 syslog priority critical msg "Server IP echo failed:
OID=$_snmp_oid_val"
Router(config-applet)# action 1.1 snmp-trap strdata "EEM detected server reachability
failure to 10.1.88.9"
Router(config-applet)# action 1.2 publish-event sub-system 88000101 type 1 arg1 10.1.88.9
arg2 IPSLAEcho arg3 fail
Router(config-applet)# action 1.3 counter name _IPSLA1F value 1 op inc
```

The following example shows how to register an applet with the name one and class A and enter applet configuration mode where the timer event detector is set to trigger an event every 10 seconds. When the event is triggered, the **action syslog** command writes the message “hello world” to syslog.

```
Router(config)# event manager applet one class A
Router(config-applet)# event timer watchdog time 10
Router(config-applet)# action syslog syslog msg "hello world"
Router(config-applet)# exit
```

The following example shows how to bypass the AAA authorization when registering an applet with the name one and class A.

```
Router(config)# event manager applet one class A authorization bypass
Router(config-applet)#
```

Related Commands

| Command | Description |
|---|-----------------------------------|
| show event manager policy registered | Displays registered EEM policies. |

export-protocol netflow-v9

To configure NetFlow Version 9 export as the export protocol for a Flexible NetFlow exporter, use the **export-protocol netflow-v9** command in flow exporter configuration mode.

export-protocol netflow-v9

Syntax Description This command has no arguments or keywords.

Command Default NetFlow Version 9 is enabled.

Command Modes Flow exporter configuration

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The device does not support NetFlow v5 export format, only NetFlow v9 export format is supported.

The following example configures NetFlow Version 9 export as the export protocol for a NetFlow exporter:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# export-protocol netflow-v9
```

export-protocol netflow-v5

To configure NetFlow Version 5 export as the export protocol for a Flexible NetFlow exporter, use the **export-protocol netflow-v5** command in flow exporter configuration mode.

export-protocol netflow-v5

Syntax Description This command has no arguments or keywords.

Command Default NetFlow Version 5 is enabled.

Command Modes Flow exporter configuration

| Command History | Release | Modification |
|------------------------|--------------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

exporter

To add a flow exporter for a flow monitor, use the **exporter** command in the appropriate configuration mode. To remove a flow exporter for a flow monitor, use the **no** form of this command.

exporter *exporter-name*
no exporter *exporter-name*

| | |
|---------------------------|--|
| Syntax Description | <i>exporter-name</i> Name of a flow exporter that was previously configured. |
|---------------------------|--|

| | |
|------------------------|--------------------------------|
| Command Default | An exporter is not configured. |
|------------------------|--------------------------------|

| | |
|----------------------|----------------------------|
| Command Modes | Flow monitor configuration |
|----------------------|----------------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | You must have already created a flow exporter by using the flow exporter command before you can apply the flow exporter to a flow monitor with the exporter command. |
|-------------------------|--|

To return this command to its default settings, use the **no exporter** or **default exporter** flow monitor configuration command.

Examples

The following example configures an exporter for a flow monitor:

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# exporter EXPORTER-1
```

fconfigure

To specify the options in a channel use the **fconfigure** command in the TCL configuration mode.

fconfigure *channel-name* **remote** [*host port*] **broadcast** *boolean* **vrf** *vrf-table-name*

Syntax Description

| | |
|------------------|---|
| remote | Configures a remote session. It supports both IPv4 and IPv6 addresses. |
| broadcast | Enables or disables broadcasting. The value of the option must be a proper boolean value. |
| vrf | Returns the local VRF table name for the specified socket. If no VRF Table has been configured for the given socket, TCL_ERROR will be returned and “No VRF table configured” will be appended to the interpreter result. |

Command Default

Command Modes

TCL configuration mode

Command History

| Release | Modification |
|-------------------------------|--|
| Cisco IOS XE Amsterdam 17.2.1 | The myvrf keyword was introduced. |

filter (ERSPAN)

To configure the Encapsulated Remote Switched Port Analyzer (ERSPAN) source VLAN filtering when the ERSPAN source is a trunk port, use the **filter** command in ERSPAN monitor source session configuration mode. To remove the configuration, use the **no** form of this command.

```
filter {ip access-group {standard-access-list extended-access-list acl-name} | ipv6 access-group acl-name
| mac access-group acl-name | sgt sgt-id [{,}] [-]} | vlan vlan-id [{,}] [-]}
no filter {ip [{access-group | [{ standard-access-list extended-access-list acl-name }]}] | ipv6
[access-group] | mac [access-group] | sgt sgt-id [{,}] [-]} | vlan vlan-id [{,}] [-]}
```

| Syntax Description | | |
|-----------------------------|--|---|
| ip | | Specifies the IP access control rules. |
| access-group | | Specifies an access control group. |
| <i>standard-access-list</i> | | Standard IP access list. |
| <i>extended-access-list</i> | | Extended IP access list. |
| <i>acl-name</i> | | Access list name. |
| ipv6 | | Specifies the IPv6 access control rules. |
| mac | | Specifies the media access control (MAC) rules. |
| sgt <i>sgt-ID</i> | | Specifies the Security Group Tag (SGT). Valid values are from 1 to 65535. |
| vlan <i>vlan-ID</i> | | Specifies the ERSPAN source VLAN. Valid values are from 1 to 4094. |
| , | | (Optional) Specifies another VLAN. |
| - | | (Optional) Specifies a range of VLANs. |

Command Default Source VLAN filtering is not configured.

Command Modes ERSPAN monitor source session configuration mode (config-mon-erspan-src)

| Command History | Release | Modification |
|-----------------|--------------------------------|--|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.11.1 | The sgt keyword was introduced. |

Usage Guidelines You cannot include source VLANs and filter VLANs in the same session.

When you configure the **filter** command on a monitored trunk interface, only traffic on that set of specified VLANs is monitored.

Examples The following example shows how to configure source VLAN filtering:

```
Device(config)# monitor session 2 type erspan-source  
Device(config-mon-erspan-src)# filter vlan 3
```

Related Commands

| Command | Description |
|-----------------------------|--|
| monitor session type | Configures a local ERSPAN source or destination session. |

flow exporter

To create a Flexible NetFlow flow exporter, or to modify an existing Flexible NetFlow flow exporter, and enter Flexible NetFlow flow exporter configuration mode, use the **flow exporter** command in global configuration mode. To remove a Flexible NetFlow flow exporter, use the **no** form of this command.

flow exporter *exporter-name*
no flow exporter *exporter-name*

| | |
|---------------------------|---|
| Syntax Description | <i>exporter-name</i> Name of the flow exporter that is being created or modified. |
|---------------------------|---|

| | |
|------------------------|---|
| Command Default | Flexible NetFlow flow exporters are not present in the configuration. |
|------------------------|---|

| | |
|----------------------|----------------------|
| Command Modes | Global configuration |
|----------------------|----------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | Flow exporters export the data in the flow monitor cache to a remote system, such as a server running NetFlow collector, for analysis and storage. Flow exporters are created as separate entities in the configuration. Flow exporters are assigned to flow monitors to provide data export capability for the flow monitors. You can create several flow exporters and assign them to one or more flow monitors to provide several export destinations. You can create one flow exporter and apply it to several flow monitors. |
|-------------------------|---|

| | |
|-----------------|---|
| Examples | The following example creates a flow exporter named FLOW-EXPORTER-1 and enters Flexible NetFlow flow exporter configuration mode: |
|-----------------|---|

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)#
```

flow monitor

To create a flow monitor, or to modify an existing flow monitor, and enter flow monitor configuration mode, use the **flow monitor** command in global configuration mode. To remove a flow monitor, use the **no** form of this command.

flow monitor *monitor-name*
no flow monitor *monitor-name*

| | |
|---------------------------|---|
| Syntax Description | <i>monitor-name</i> Name of the flow monitor that is being created or modified. |
|---------------------------|---|

| | |
|------------------------|--|
| Command Default | Flexible NetFlow flow monitors are not present in the configuration. |
|------------------------|--|

| | |
|----------------------|----------------------|
| Command Modes | Global configuration |
|----------------------|----------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | Flow monitors are the Flexible NetFlow component that is applied to interfaces to perform network traffic monitoring. Flow monitors consist of a flow record and a cache. You add the record to the flow monitor after you create the flow monitor. The flow monitor cache is automatically created at the time the flow monitor is applied to the first interface. Flow data is collected from the network traffic during the monitoring process based on the key and nonkey fields in the flow monitor's record and stored in the flow monitor cache. |
|-------------------------|---|

| | |
|-----------------|---|
| Examples | The following example creates a flow monitor named FLOW-MONITOR-1 and enters flow monitor configuration mode: |
|-----------------|---|

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)#
```

flow record

To create a Flexible NetFlow flow record, or to modify an existing Flexible NetFlow flow record, and enter Flexible NetFlow flow record configuration mode, use the **flow record** command in global configuration mode. To remove a Flexible NetFlow record, use the **no** form of this command.

flow record *record-name*
no flow record *record-name*

| | |
|---------------------------|---|
| Syntax Description | <i>record-name</i> Name of the flow record that is being created or modified. |
|---------------------------|---|

| | |
|------------------------|---|
| Command Default | A Flexible NetFlow flow record is not configured. |
|------------------------|---|

| | |
|----------------------|----------------------|
| Command Modes | Global configuration |
|----------------------|----------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | A flow record defines the keys that Flexible NetFlow uses to identify packets in the flow, as well as other fields of interest that Flexible NetFlow gathers for the flow. You can define a flow record with any combination of keys and fields of interest. The device supports a rich set of keys. A flow record also defines the types of counters gathered per flow. You can configure 64-bit packet or byte counters. |
|-------------------------|--|

Examples

The following example creates a flow record named FLOW-RECORD-1, and enters Flexible NetFlow flow record configuration mode:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)#
```

header-type

To configure the ERSPAN header type for encapsulation, use the **header-type** command in ERSPAN monitor source session configuration mode. To remove the configuration, use the **no** form of this command.

```
header-type header-type
no header-type header-type
```

| | |
|---------------------------|--|
| Syntax Description | <i>header-type</i> ERSPAN header type. Valid header types are 2 and 3. |
|---------------------------|--|

| | |
|------------------------|---------------------------------|
| Command Default | ERSPAN header type is set to 2. |
|------------------------|---------------------------------|

| | |
|----------------------|--|
| Command Modes | ERSPAN monitor source session configuration mode (config-mon-erspan-src) |
|----------------------|--|

| Command History | Release | Modification |
|------------------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

Examples

The following example shows how to change the ERSPAN header type to 3:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# header-type 3
```

| Related Commands | Command | Description |
|-------------------------|-----------------------------|--|
| | monitor session type | Configures a local ERSPAN source or destination session. |

inactive time

To configure et-analytics inactive timer value, use the **inactive time *seconds*** command in the et-analytics configuration mode. To disable the timer settings, use the **no** form of the command.

inactive time *seconds*
no inactive time *seconds*

| | | |
|---------------------------|--|--|
| Syntax Description | inactive time | Configures the inactive timer value. |
| | <i>seconds</i> | Timer value in seconds. The range is from 1 to 604800 and the default value is 60 seconds. |
| Command Default | Disabled. | |
| Command Modes | et-analytics configuration (config-et-analytics) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example:

The following example shows how to configure an inactive timer of 10 seconds:

```
Device>enable
Device#configure terminal
Device(config)# et-analytics
Device(config-et-analytics)# inactive time 10
```

ip flow-export destination

To configure the global collector destination IP address, use the **ip flow-export destination** *ip_address port* command in the et-analytics configuration mode. To remove the collector destination IP address, use the **no** form of the command.

ip flow-export destination *ip_address port*
no ip flow-export destination *ip_address port*

| Syntax Description | ip flow-export destination | |
|--------------------|--|--|
| | | Configures the global collector destination IP address and port. |
| | <i>ip_address</i> | Destination IP address. |
| | <i>port</i> | Destination port. |
| Command Default | Disabled. | |
| Command Modes | et-analytics configuration (config-et-analytics) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example:

The following example shows how to configure a flow-exporter destination IP address of 10.1.1.1 and port 2055:

```
Device>enable
Device#configure terminal
Device(config)# et-analytics
Device(config-et)# ip flow-export destination 10.1.1.1 2055
```

ip wccp

To enable the web cache service, and specify the service number that corresponds to a dynamic service that is defined by the application engine, use the **ip wccp** global configuration command on the device. Use the **no** form of this command to disable the service.

```
ip wccp {web-cache | service-number} [group-address groupaddress] [group-list access-list]
[redirect-list access-list] [password encryption-number password]
no ip wccp {web-cache | service-number} [group-address groupaddress] [group-list access-list]
[redirect-list access-list] [password encryption-number password]
```

Syntax Description

| | |
|---|--|
| web-cache | Specifies the web-cache service (WCCP Version 1 and Version 2). |
| <i>service-number</i> | Dynamic service identifier, which means the service definition is dictated by the cache. The dynamic service number can be from 0 to 254. The maximum number of services is 256, which includes the web-cache service specified with the web-cache keyword. |
| group-address <i>groupaddress</i> | (Optional) Specifies the multicast group address used by the device and the application engines to participate in the service group. |
| group-list <i>access-list</i> | (Optional) If a multicast group address is not used, specifies a list of valid IP addresses that correspond to the application engines that are participating in the service group. |
| redirect-list <i>access-list</i> | (Optional) Specifies the redirect service for specific hosts or specific packets from hosts. |
| password <i>encryption-number</i> <i>password</i> | (Optional) Specifies an encryption number. The range is 0 to 7. Use 0 for not encrypted, and use 7 for proprietary. Also, specifies a password name up to seven characters in length. The device combines the password with the MD5 authentication value to create security for the connection between the device and the application engine. By default, no password is configured, and no authentication is performed. |

Command Default

WCCP services are not enabled on the device.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

WCCP transparent caching bypasses Network Address Translation (NAT) when Cisco Express Forwarding switching is enabled. To work around this situation, configure WCCP transparent caching in the outgoing direction, enable Cisco Express Forwarding switching on the content engine interface, and specify the **ip wccp web-cache redirect out** command. Configure WCCP in the incoming direction on the inside interface by

specifying the **ip wccp redirect exclude in** command on the router interface facing the cache. This configuration prevents the redirection of any packets arriving on that interface.

You can also include a redirect list when configuring a service group. The specified redirect list will deny packets with a NAT (source) IP address and prevent redirection.

This command instructs a device to enable or disable support for the specified service number or the web-cache service name. A service number can be from 0 to 254. Once the service number or name is enabled, the router can participate in the establishment of a service group.

When the **no ip wccp** command is entered, the device terminates participation in the service group, deallocates space if none of the interfaces still have the service configured, and terminates the WCCP task if no other services are configured.

The keywords following the **web-cache** keyword and the *service-number* argument are optional and may be specified in any order, but only may be specified once.

Example

The following example configures a web cache, the interface connected to the application engine or the server, and the interface connected to the client:

```
Device(config)# ip wccp web-cache
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no switchport
Device(config-if)# ip address 172.20.10.30 255.255.255.0
Device(config-if)# no shutdown
Device(config-if)# exit
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# no switchport
Device(config-if)#
*Dec 6 13:11:29.507: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/3, changed state to down

Device(config-if)# ip address 175.20.20.10 255.255.255.0
Device(config-if)# no shutdown
Device(config-if)# ip wccp web-cache redirect in
Device(config-if)# ip wccp web-cache group-listen
Device(config-if)# exit
```

ip flow monitor

To enable a Flexible NetFlow flow monitor for IPv4 traffic that the device is receiving, use the **ip flow monitor** command in interface configuration mode. To disable a flow monitor, use the **no** form of this command.

```
ip flow monitor monitor-name [sampler sampler-name] input
no ip flow monitor monitor-name [sampler sampler-name] input
```

Syntax Description

| | |
|------------------------------------|---|
| <i>monitor-name</i> | Name of the flow monitor to apply to the interface. |
| sampler <i>sampler-name</i> | (Optional) Enables the specified flow sampler for the flow monitor. |
| input | Monitors IPv4 traffic that the device receives on the interface. |

Command Default

A flow monitor is not enabled.

Command Modes

Interface configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Before you can apply a flow monitor to an interface with the **ip flow monitor** command, you must have already created the flow monitor using the **flow monitor** global configuration command.

When you add a sampler to a flow monitor, only packets that are selected by the named sampler will be entered into the cache to form flows. Each use of a sampler causes separate statistics to be stored for that usage.

You cannot add a sampler to a flow monitor after the flow monitor has been enabled on the interface. You must first remove the flow monitor from the interface and then enable the same flow monitor with a sampler.

Note The statistics for each flow must be scaled to give the expected true usage. For example, with a 1 in 100 sampler it is expected that the packet and byte counters will have to be multiplied by 100.

The following example enables a flow monitor for monitoring input traffic:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip flow monitor FLOW-MONITOR-1 input
```

The following example enables a flow monitor for monitoring input traffic, with a sampler to limit the input packets that are sampled:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip flow monitor FLOW-MONITOR-1 sampler SAMPLER-1 input
```

The following example shows what happens when you try to add a sampler to a flow monitor that has already been enabled on an interface without a sampler:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip flow monitor FLOW-MONITOR-1 sampler SAMPLER-2 input
% Flow Monitor: Flow Monitor 'FLOW-MONITOR-1' is already on in full mode and cannot be
enabled with a sampler.
```

The following example shows how to remove a flow monitor from an interface so that it can be enabled with the sampler:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no ip flow monitor FLOW-MONITOR-1 input
Device(config-if)# ip flow monitor FLOW-MONITOR-1 sampler SAMPLER-2 input
```

ipv6 flow monitor

To enable a flow monitor for IPv6 traffic that the device is receiving, use the **ipv6 flow monitor** command in interface configuration mode. To disable a flow monitor, use the **no** form of this command.

```
ipv6 flow monitor monitor-name [sampler sampler-name] input
no ipv6 flow monitor monitor-name [sampler sampler-name] input
```

| Syntax Description | | |
|--------------------|------------------------------------|---|
| | <i>monitor-name</i> | Name of the flow monitor to apply to the interface. |
| | sampler <i>sampler-name</i> | (Optional) Enables the specified flow sampler for the flow monitor. |
| | input | Monitors IPv6 traffic that the device receives on the interface. |

Command Default A flow monitor is not enabled.

Command Modes Interface configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Before you can apply a flow monitor to the interface with the **ipv6 flow monitor** command, you must have already created the flow monitor using the **flow monitor** global configuration command.

When you add a sampler to a flow monitor, only packets that are selected by the named sampler will be entered into the cache to form flows. Each use of a sampler causes separate statistics to be stored for that usage.

You cannot add a sampler to a flow monitor after the flow monitor has been enabled on the interface. You must first remove the flow monitor from the interface and then enable the same flow monitor with a sampler.

Note The statistics for each flow must be scaled to give the expected true usage. For example, with a 1 in 100 sampler it is expected that the packet and byte counters will have to be multiplied by 100.

The following example enables a flow monitor for monitoring input traffic:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ipv6 flow monitor FLOW-MONITOR-1 input
```

The following example enables a flow monitor for monitoring input traffic, with a sampler to limit the input packets that are sampled:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ipv6 flow monitor FLOW-MONITOR-1 sampler SAMPLER-1 input
```

The following example shows what happens when you try to add a sampler to a flow monitor that has already been enabled on an interface without a sampler:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ipv6 flow monitor FLOW-MONITOR-1 sampler SAMPLER-2 input
% Flow Monitor: Flow Monitor 'FLOW-MONITOR-1' is already on in full mode and cannot be
enabled with a sampler.
```

The following example shows how to remove a flow monitor from an interface so that it can be enabled with the sampler:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no ipv6 flow monitor FLOW-MONITOR-1 input
Device(config-if)# ipv6 flow monitor FLOW-MONITOR-1 sampler SAMPLER-2 input
```

ipv6 deny echo reply

To disable the generation of ICMP IPv6 echo reply message to an IPv6 multicast address or anycast address, use the **ipv6 deny-echo-reply** command in the global configuration mode. To enable the generation of ICMP IPv6 echo reply message, use the **no** form of the command.

ipv6 deny-echo-reply
no ipv6 deny-echo-reply

Command Default ICMPv6 Echo Reply messages are sent from the device.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-------------------------------|-----------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | The command was introduced. |

Usage Guidelines The **ipv6 deny-echo-reply** command works only for an IPv6 multicast or anycast address. It does not suppress an echo reply message for an IPv6 unicast address.

The following example shows how to configure a device to stop sending a response to an ICMPv6 echo message:

```
Device# configure terminal
Device(config)#ipv6 deny-echo-reply
Router(config)#end
```

The following example shows how to remove the **ipv6 deny-echo-reply** configuration:

```
Device# configure terminal
Device(config)#no ipv6 deny-echo-reply
Router(config)#end
```

match datalink ethertype

To configure the EtherType of the packet as a key field for a flow record, use the **match datalink ethertype** command in flow record configuration mode. To disable the EtherType of the packet as a key field for a flow record, use the **no** form of this command.

match datalink ethertype
no match datalink ethertype

| | | |
|---------------------------|---|------------------------------|
| Syntax Description | This command has no arguments or keywords. | |
| Command Default | The EtherType of the packet is not configured as a key field. | |
| Command Modes | Flow record configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

When you configure the EtherType of the packet as a key field for a flow record using the **match datalink ethertype** command, the traffic flow that is created is based on the type of flow monitor that is assigned to the interface:

- When a datalink flow monitor is assigned to an interface using the **datalink flow monitor** interface configuration command, it creates unique flows for different Layer 2 protocols.
- When an IP flow monitor is assigned to an interface using the **ip flow monitor** interface configuration command, it creates unique flows for different IPv4 protocols.
- When an IPv6 flow monitor is assigned to an interface using the **ipv6 flow monitor** interface configuration command, it creates unique flows for different IPv6 protocols.

To return this command to its default settings, use the **no match datalink ethertype** or **default match datalink ethertype** flow record configuration command.

The following example configures the EtherType of the packet as a key field for a Flexible NetFlow flow record:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match datalink ethertype
```

match datalink mac

To configure the use of MAC addresses as a key field for a flow record, use the **match datalink mac** command in flow record configuration mode. To disable the use of MAC addresses as a key field for a flow record, use the **no** form of this command.

```
match datalink mac {destination address input | source address input}
no match datalink mac {destination address input | source address input}
```

| Syntax Description | Field | Description |
|--------------------|--|---|
| | destination address | Configures the use of the destination MAC address as a key field. |
| | input | Specifies the MAC address of input packets. |
| | source address | Configures the use of the source MAC address as a key field. |
| Command Default | MAC addresses are not configured as a key field. | |
| Command Modes | Flow record configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The **input** keyword is used to specify the observation point that is used by the **match datalink mac** command to create flows based on the unique MAC addresses in the network traffic.

Note When a datalink flow monitor is assigned to an interface or VLAN record, it creates flows only for non-IPv6 or non-IPv4 traffic.

To return this command to its default settings, use the **no match datalink mac** or **default match datalink mac** flow record configuration command.

The following example configures the use of the destination MAC address of packets that are received by the device as a key field for a flow record:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match datalink mac destination address input
```

match datalink vlan

To configure the VLAN ID as a key field for a flow record, use the **match datalink vlan** command in flow record configuration mode. To disable the use of the VLAN ID value as a key field for a flow record, use the **no** form of this command.

```
match datalink vlan input
no match datalink vlan input
```

| Syntax Description | input Configures the VLAN ID of traffic being received by the device as a key field. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | The VLAN ID is not configured as a key field. | | | | |
| Command Modes | Flow record configuration | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |
| Usage Guidelines | <p>A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the match command.</p> <p>The input keyword is used to specify the observation point that is used by the match datalink vlan command to create flows based on the unique VLAN IDs in the network traffic.</p> <p>The following example configures the VLAN ID of traffic being received by the device as a key field for a flow record:</p> <pre>Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match datalink vlan input</pre> | | | | |

match device-type

To evaluate control classes based on the device type, use the **match device-type** command in control class-map filter mode. To disable this condition, use the **no** form of this command.

match device-type { *device-name* | **regex** *regular-expression* }

no match device-type

| | | |
|---------------------------|--|--|
| Syntax Description | <i>device-name</i> | Device name for the class map attribute filter criteria. |
| | regex <i>regular-expression</i> | Regular expression to specify the filter type. |

Command Default No default behavior or values.

Command Modes Control class-map filter (config-filter-control-classmap)

| Command History | Release | Modification |
|------------------------|-------------------------------|------------------------------|
| | Cisco IOS XE Bengaluru 17.6.1 | This command was introduced. |

Examples

The following example shows how to set a class map filter to match a device type:

```
Device> enable
Device# configure terminal
Device(config)# class-map type control subscriber match-all DOT1X_NO_AGENT
Device(config-filter-control-classmap)# match device-type regex cis*
```

match flow cts

To configure CTS source group tag and destination group tag for a flow record, use the **match flow cts** command in flow record configuration mode. To disable the group tag as key field for a flow record, use the **no** form of this command.

match flow cts {source | destination} group-tag
no match flow cts {source | destination} group-tag

| | | |
|---------------------------|--|--|
| Syntax Description | cts destination group-tag | Configures the CTS destination field group as a key field. |
| | cts source group-tag | Configures the CTS source field group as a key field. |
| Command Default | The CTS destination or source field group, flow direction and the flow sampler ID are not configured as key fields. | |
| Command Modes | Flexible NetFlow flow record configuration (config-flow-record) Policy inline configuration (config-if-policy-inline) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | The command was introduced. |
| Usage Guidelines | A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the match command. | |

The following example configures the source group-tag as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match flow cts source group-tag
```

match flow direction

To configure the flow direction as key fields for a flow record, use the **match flow direction** command in flow record configuration mode. To disable the use of the flow direction as key fields for a flow record, use the **no** form of this command.

match flow direction
no match flow direction

Syntax Description This command has no arguments or keywords.

Command Default The flow direction is not configured as key fields.

Command Modes Flow record configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The **match flow direction** command captures the direction of the flow as a key field. This feature is most useful when a single flow monitor is configured for input and output flows. It can be used to find and eliminate flows that are being monitored twice, once on input and once on output. This command can help to match up pairs of flows in the exported data when the two flows are flowing in opposite directions.

The following example configures the direction the flow was monitored in as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match flow direction
```

match interface

To configure the input and output interfaces as key fields for a flow record, use the **match interface** command in flow record configuration mode. To disable the use of the input and output interfaces as key fields for a flow record, use the **no** form of this command.

```
match interface {input | output}
no match interface {input | output}
```

Syntax Description

input Configures the input interface as a key field.

output Configures the output interface as a key field.

Command Default

The input and output interfaces are not configured as key fields.

Command Modes

Flow record configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the input interface as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match interface input
```

The following example configures the output interface as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match interface output
```

match ipv4

To configure one or more of the IPv4 fields as a key field for a flow record, use the **match ipv4** command in flow record configuration mode. To disable the use of one or more of the IPv4 fields as a key field for a flow record, use the **no** form of this command.

```
match ipv4 {destination address | protocol | source address | tos | version}
no match ipv4 {destination address | protocol | source address | tos | version}
```

| Syntax Description | |
|----------------------------|--|
| destination address | Configures the IPv4 destination address as a key field. For more information see <i>match ipv4 destination address</i> . |
| protocol | Configures the IPv4 protocol as a key field. |
| source address | Configures the IPv4 destination address as a key field. For more information see <i>match ipv4 source address</i> . |
| tos | Configures the IPv4 ToS as a key field. |
| version | Configures the IP version from IPv4 header as a key field. |

Command Default The use of one or more of the IPv4 fields as a key field for a user-defined flow record is not enabled.

Command Modes Flow record configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the IPv4 protocol as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv4 protocol
```

match ipv4 destination address

To configure the IPv4 destination address as a key field for a flow record, use the **match ipv4 destination address** command in flow record configuration mode. To disable the IPv4 destination address as a key field for a flow record, use the **no** form of this command.

match ipv4 destination address
no match ipv4 destination address

Syntax Description

This command has no arguments or keywords.

Command Default

The IPv4 destination address is not configured as a key field.

Command Modes

Flow record configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

To return this command to its default settings, use the **no match ipv4 destination address** or **default match ipv4 destination address** flow record configuration command.

The following example configures the IPv4 destination address as a key field for a flow record:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv4 destination address
```

match ipv4 source address

To configure the IPv4 source address as a key field for a flow record, use the **match ipv4 source address** command in flow record configuration mode. To disable the use of the IPv4 source address as a key field for a flow record, use the **no** form of this command.

match ipv4 source address
no match ipv4 source address

Syntax Description This command has no arguments or keywords.

Command Default The IPv4 source address is not configured as a key field.

Command Modes Flow record configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

To return this command to its default settings, use the **no match ipv4 source address** or **default match ipv4 source address** flow record configuration command.

The following example configures the IPv4 source address as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv4 source address
```

match ipv4 ttl

To configure the IPv4 time-to-live (TTL) field as a key field for a flow record, use the **match ipv4 ttl** command in flow record configuration mode. To disable the use of the IPv4 TTL field as a key field for a flow record, use the **no** form of this command.

match ipv4 ttl
no match ipv4 ttl

| Syntax Description | This command has no arguments or keywords. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | The IPv4 time-to-live (TTL) field is not configured as a key field. | | | | |
| Command Modes | Flow record configuration | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match ipv4 ttl** command.

The following example configures IPv4 TTL as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv4 ttl
```

match ipv6

To configure one or more of the IPv6 fields as a key field for a flow record, use the **match ipv6** command in flow record configuration mode. To disable the use of one or more of the IPv6 fields as a key field for a flow record, use the **no** form of this command.

```
match ipv6 {destination address | protocol | source address | traffic-class | version}
no match ipv6 {destination address | protocol | source address | traffic-class | version}
```

| | | |
|---------------------------|--|--|
| Syntax Description | destination address | Configures the IPv4 destination address as a key field. For more information see <i>match ipv6 destination address</i> . |
| | protocol | Configures the IPv6 protocol as a key field. |
| | source address | Configures the IPv4 destination address as a key field. For more information see <i>match ipv6 source address</i> . |
| Command Default | The IPv6 fields are not configured as a key field. | |
| Command Modes | Flow record configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the IPv6 protocol field as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 protocol
```

match ipv6 destination address

To configure the IPv6 destination address as a key field for a flow record, use the **match ipv6 destination address** command in flow record configuration mode. To disable the IPv6 destination address as a key field for a flow record, use the **no** form of this command.

```
match ipv6 destination address
no match ipv6 destination address
```

| Syntax Description | This command has no arguments or keywords. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | The IPv6 destination address is not configured as a key field. | | | | |
| Command Modes | Flow record configuration | | | | |
| Command History | <table><thead><tr><th>Release</th><th>Modification</th></tr></thead><tbody><tr><td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr></tbody></table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

To return this command to its default settings, use the **no match ipv6 destination address** or **default match ipv6 destination address** flow record configuration command.

The following example configures the IPv6 destination address as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 destination address
```

match ipv6 hop-limit

To configure the IPv6 hop limit as a key field for a flow record, use the **match ipv6 hop-limit** command in flow record configuration mode. To disable the use of a section of an IPv6 packet as a key field for a flow record, use the **no** form of this command.

match ipv6 hop-limit
no match ipv6 hop-limit

Syntax Description

This command has no arguments or keywords.

Command Default

The use of the IPv6 hop limit as a key field for a user-defined flow record is not enabled by default.

Command Modes

Flow record configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the hop limit of the packets in the flow as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 hop-limit
```

match ipv6 source address

To configure the IPv6 source address as a key field for a flow record, use the **match ipv6 source address** command in flow record configuration mode. To disable the use of the IPv6 source address as a key field for a flow record, use the **no** form of this command.

match ipv6 source address
no match ipv6 source address

| Syntax Description | This command has no arguments or keywords. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | The IPv6 source address is not configured as a key field. | | | | |
| Command Modes | Flow record configuration | | | | |
| Command History | <table><thead><tr><th>Release</th><th>Modification</th></tr></thead><tbody><tr><td>Cisco IOS XE Everest 16.6.1</td><td>This command was introduced.</td></tr></tbody></table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

To return this command to its default settings, use the **no match ipv6 source address** or **default match ipv6 source address** flow record configuration command.

The following example configures a IPv6 source address as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 source address
```

map platform-type

To set the parameter map attribute filter criteria to platform type, use the **map platform-type** command in parameter-map filter mode. To remove this criteria, use the **no** form of this command.

```
map-number map platform-type { {eq | not-eq | regex} platform-type }
no map-number map platform-type { {eq | not-eq | regex} platform-type }
```

Syntax Description

| | |
|----------------------|---|
| <i>map-number</i> | Parameter map number. |
| eq | Specifies that the filter type name is equal to the platform type name. |
| not-eq | Specifies that the filter type name is not equal to the platform type name. |
| regex | Specifies that the filter type name is a regular expression. |
| <i>platform-type</i> | Platform type for the parameter map attribute filter criteria. |

Command Default

No default behavior or values.

Command Modes

Parameter-map filter (config-parameter-map-filter)

Command History

| Release | Modification |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

Examples

The following example shows how to set the parameter map attribute filter criteria to platform type:

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type subscriber attribute-to-service Aironet-Policy-para
Device(config-parameter-map-filter)# 10 map platform-type eq C9xxx
```

Related Commands

| Command | Description |
|---|---|
| parameter-map type subscriber attribute-to-service | Configures a subscriber parameter map and enters parameter-map filter configuration mode. |

match transport

To configure one or more of the transport fields as a key field for a flow record, use the **match transport** command in flow record configuration mode. To disable the use of one or more of the transport fields as a key field for a flow record, use the **no** form of this command.

| | |
|---------------------------|---|
| Syntax Description | destination-port Configures the transport destination port as a key field. |
| | source-port Configures the transport source port as a key field. |

Command Default The transport fields are not configured as a key field.

Command Modes Flow record configuration

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the destination port as a key field:

```
(config)# flow record FLOW-RECORD-1
(config-flow-record)# match transport destination-port
```

The following example configures the source port as a key field:

```
(config)# flow record FLOW-RECORD-1
(config-flow-record)# match transport source-port
```

match transport icmp ipv4

To configure the ICMP IPv4 type field and the code field as key fields for a flow record, use the **match transport icmp ipv4** command in flow record configuration mode. To disable the use of the ICMP IPv4 type field and code field as key fields for a flow record, use the **no** form of this command.

```
match transport icmp ipv4 {code | type}
no match transport icmp ipv4 {code | type}
```

Syntax Description

code Configures the IPv4 ICMP code as a key field.

type Configures the IPv4 ICMP type as a key field.

Command Default

The ICMP IPv4 type field and the code field are not configured as key fields.

Command Modes

Flow record configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the IPv4 ICMP code field as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match transport icmp ipv4 code
```

The following example configures the IPv4 ICMP type field as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match transport icmp ipv4 type
```

match transport icmp ipv6

To configure the ICMP IPv6 type field and the code field as key fields for a flow record, use the **match transport icmp ipv6** command in flow record configuration mode. To disable the use of the ICMP IPv6 type field and code field as key fields for a flow record, use the **no** form of this command.

```
match transport icmp ipv6 {code | type}
no match transport icmp ipv6 {code | type}
```

Syntax Description

code Configures the IPv6 ICMP code as a key field.

type Configures the IPv6 ICMP type as a key field.

Command Default

The ICMP IPv6 type field and the code field are not configured as key fields.

Command Modes

Flow record configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the IPv6 ICMP code field as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match transport icmp ipv6 code
```

The following example configures the IPv6 ICMP type field as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match transport icmp ipv6 type
```

match platform-type

To evaluate control classes based on the platform type, use the **match platform-type** command in control class-map filter mode. To remove this condition, use the **no** form of this command.

match platform-type *platform-name*
no match platform-type *platform-name*

| | |
|---------------------------|--|
| Syntax Description | <i>platform-name</i> Name of the platform. |
|---------------------------|--|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|---|
| Command Modes | Control class-map filter (config-filter-control-classmap) |
|----------------------|---|

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

Examples

The following example shows how to set a class map filter to match a platform type:

```
Device> enable
Device# configure terminal
Device(config)# class-map type control subscriber match-all DOT1X_NO_AGENT
Device(config-filter-control-classmap)# match platform-type C9xxx
```

Related Commands

| Command | Description |
|--|---|
| class-map type control subscriber | Creates a control class and enters control class-map filter mode. |

mode random 1 out-of

To enable random sampling and to specify the packet interval for a Flexible NetFlow sampler, use the **mode random 1 out-of** command in sampler configuration mode. To remove the packet interval information for a Flexible NetFlow sampler, use the **no** form of this command.

```
mode random 1 out-of window-size
no mode
```

| | |
|---------------------------|--|
| Syntax Description | <i>window-size</i> Specifies the window size from which to select packets. The range is 2 to 1024. |
|---------------------------|--|

| | |
|------------------------|--|
| Command Default | The mode and the packet interval for a sampler are not configured. |
|------------------------|--|

| | |
|----------------------|-----------------------|
| Command Modes | Sampler configuration |
|----------------------|-----------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | A total of four unique samplers are supported on the device. Packets are chosen in a manner that should eliminate any bias from traffic patterns and counter any attempt by users to avoid monitoring. |
|-------------------------|--|

| | |
|-------------|---|
| Note | The deterministic keyword is not supported, even though it is visible in the command-line help string. |
|-------------|---|

Examples

The following example enables random sampling with a window size of 1000:

```
Device(config)# sampler SAMPLER-1
Device(config-sampler)# mode random 1 out-of 1000
```

monitor capture (interface/control plane)

To configure monitor capture points specifying an attachment point and the packet flow direction or add more attachment points to a capture point, use the **monitor capture** command in privileged EXEC mode. To disable the monitor capture with the specified attachment point and the packet flow direction or disable one of multiple attachment points on a capture point, use the **no** form of this command.

monitor capture {*capture-name*} {**interface** *interface-type interface-id* | **control-plane**} {**in** | **out** | **both**}

no monitor capture {*capture-name*} {**interface** *interface-type interface-id* | **control-plane**} {**in** | **out** | **both**}

| Syntax Description | | |
|---|--|--|
| <i>capture-name</i> | | The name of the capture to be defined. |
| interface <i>interface-type interface-id</i> | | Specifies an interface with <i>interface-type</i> and <i>interface-id</i> as an attachment point. The arguments have these meanings: <ul style="list-style-type: none"> • GigabitEthernet <i>interface-id</i>—A Gigabit Ethernet IEEE 802.3z interface. • vlan <i>vlan-id</i>—A VLAN. The range for <i>vlan-id</i> is 1 to 4095. |
| control-plane | | Specifies the control plane as an attachment point. |
| in out both | | Specifies the traffic direction to be captured. |

Command Default A Wireshark capture is not configured.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Once an attachment point has been associated with a capture point using this command, the only way to change its direction is to remove the attachment point using the **no** form of the command and reattach the attachment point with the new direction. An attachment point's direction cannot be overridden.

If an attachment point is removed from a capture point and only one attachment point is associated with it, the capture point is effectively deleted.

Multiple attachment points can be associated with a capture point by re-running this command with another attachment point. An example is provided below.

Packets captured in the output direction of an interface might not reflect the changes made by switch rewrite (includes TTL, VLAN tag, CoS, checksum, MAC addresses, DSCP, precedent, UP, etc.).

No specific order applies when defining a capture point; you can define capture point parameters in any order. The Wireshark CLI allows as many parameters as possible on a single line. This limits the number of commands required to define a capture point.

Neither VRFs, management ports, nor private VLANs can be used as attachment points.

Wireshark cannot capture packets on a destination SPAN port.

When a VLAN is used as a Wireshark attachment point, packets are captured in the input direction only.

Examples

To define a capture point using a physical interface as an attachment point:

```
Device# monitor capture mycap interface GigabitEthernet1/0/1 in
Device# monitor capture mycap match ipv4 any any
```

Note The second command defines the core filter for the capture point. This is required for a functioning capture point.

To define a capture point with multiple attachment points:

```
Device# monitor capture mycap interface GigabitEthernet1/0/1 in
Device# monitor capture mycap match ipv4 any any
Device# monitor capture mycap control-plane in
Device# show monitor capture mycap parameter
      monitor capture mycap interface GigabitEthernet1/0/1 in
      monitor capture mycap control-plane in
```

To remove an attachment point from a capture point defined with multiple attachment points:

```
Device# show monitor capture mycap parameter
      monitor capture mycap interface GigabitEthernet1/0/1 in
      monitor capture mycap control-plane in
Device# no monitor capture mycap control-plane
Device# show monitor capture mycap parameter
      monitor capture mycap interface GigabitEthernet1/0/1 in
```

monitor capture buffer

To configure the buffer for monitor capture (WireShark), use the **monitor capture buffer** command in privileged EXEC mode. To disable the monitor capture buffer or change the buffer back to a default linear buffer from a circular buffer, use the **no** form of this command.

```
monitor capture {capture-name} buffer {circular [size buffer-size ] | size buffer-size}
no monitor capture {capture-name} buffer [circular ]
```

| | | |
|---------------------------|---|---|
| Syntax Description | <i>capture-name</i> | The name of the capture whose buffer is to be configured. |
| | circular | Specifies that the buffer is of a circular type. The circular type of buffer continues to capture data, even after the buffer is consumed, by overwriting the data captured previously. |
| | size <i>buffer-size</i> | (Optional) Specifies the size of the buffer. The range is from 1 MB to 100 MB. |
| Command Default | A linear buffer is configured. | |
| Command Modes | Privileged EXEC | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Usage Guidelines | When you first configure a WireShark capture, a circular buffer of a small size is suggested. | |

Example

To configure a circular buffer with a size of 1 MB:

```
Device# monitor capture mycap buffer circular size 1
```

monitor capture clear

To clear the monitor capture (WireShark) buffer, use the **monitor capture clear** command in privileged EXEC mode.

monitor capture { *capture-name* } **clear**

Syntax Description

capture-name The name of the capture whose buffer is to be cleared.

Command Default

The buffer content is not cleared.

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **monitor capture clear** command either during capture or after the capture has stopped either because one or more end conditions has been met, or you entered the **monitor capture stop** command. If you enter the **monitor capture clear** command after the capture has stopped, the **monitor capture export** command that is used to store the contents of the captured packets in a file will have no impact because the buffer has no captured packets.

If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.

Example

To clear the buffer contents for capture mycap:

```
Device# monitor capture mycap clear
```

monitor capture export

To export a monitor capture (WireShark) to a file, use the **monitor capture export** command in privileged EXEC mode.

monitor capture {*capture-name*} **export** *file-location* : *file-name*

Syntax Description

capture-name The name of the capture to be exported.

file-location : *file-name* (Optional) Specifies the location and file name of the capture storage file.

Acceptable values for *file-location* :

- flash—On-board flash storage
- — USB drive

Command Default

The captured packets are not stored.

Command Modes

Privileged EXEC

Command History

Release

Modification

This command was introduced.

Usage Guidelines

Use the **monitor capture export** command only when the storage destination is a capture buffer. The file may be stored either remotely or locally. Use this command either during capture or after the packet capture has stopped. The packet capture is stopped when one or more end conditions have been met or you entered the **monitor capture stop** command.

When WireShark is used on switches in a stack, packet captures can be stored only on the devices specified for *file-location* above that are connected to the active switch. Example: flash1 is connected to the active switch. flash2 is connected to the secondary switch. Only flash1 can be used to store packet captures.

Note Attempts to store packet captures on unsupported devices or devices not connected to the active switch will probably result in errors.

Example

To export the capture buffer contents to mycap.pcap on a flash drive:

monitor capture file

To configure monitor capture (WireShark) storage file attributes, use the **monitor capture file** command in privileged EXEC mode. To remove a storage file attribute, use the **no** form of this command.

```
monitor capture {capture-name} file{ [ buffer-size temp-buffer-size ] [ location file-location :  
file-name ] [ ring number-of-ring-files ] [ size total-size ] }  
no monitor capture {capture-name} file{ [ buffer-size ] [ location ] [ ring ] [ size ] }
```

| Syntax Description | | |
|---|--|---|
| <i>capture-name</i> | | The name of the capture to be modified. |
| buffer-size <i>temp-buffer-size</i> | | (Optional) Specifies the size of the temporary buffer. The range for <i>temp-buffer-size</i> is 1 to 100 MB. This is specified to reduce packet loss. |
| location <i>file-location</i> : <i>file-name</i> | | (Optional) Specifies the location and file name of the capture storage file. Acceptable values for <i>file-location</i> : <ul style="list-style-type: none"> • flash—On-board flash storage • — USB drive |
| ring <i>number-of-ring-files</i> | | (Optional) Specifies that the capture is to be stored in a circular file chain and the number of files in the file ring. |
| size <i>total-size</i> | | (Optional) Specifies the total size of the capture files. |

Command Default None

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **monitor capture file** command only when the storage destination is a file. The file may be stored either remotely or locally. Use this command after the packet capture has stopped. The packet capture is stopped when one or more end conditions have been met or you entered the **monitor capture stop** command.

When WireShark is used on switches in a stack, packet captures can be stored only on the devices specified for *file-location* above that are connected to the active switch. Example: flash1 is connected to the active switch. flash2 is connected to the secondary switch. Only flash1 can be used to store packet captures.

Note Attempts to store packet captures on unsupported devices or devices not connected to the active switch will probably result in errors.

Example

To specify that the storage file name is mycap.pcap, stored on a flash drive:

```
Device# monitor capture mycap file location flash:mycap.pcap
```

monitor capture limit

To configure capture limits, use the **monitor capture limit** command in privileged EXEC mode. To remove the capture limits, use the **no** form of this command.

```
monitor capture {capture-name} limit { [duration seconds] [packet-length size] [packets num] }
no monitor capture {capture-name} limit [duration] [packet-length] [packets]
```

Syntax Description

| | |
|----------------------------------|--|
| <i>capture-name</i> | The name of the capture to be assigned capture limits. |
| duration <i>seconds</i> | (Optional) Specifies the duration of the capture, in seconds. The range is from 1 to 1000000. |
| packet-length <i>size</i> | (Optional) Specifies the packet length, in bytes. If the actual packet is longer than the specified length, only the first set of bytes whose number is denoted by the bytes argument is stored. |
| packets <i>num</i> | (Optional) Specifies the number of packets to be processed for capture. |

Command Default

Capture limits are not configured.

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example

To configure a session limit of 60 seconds and a packet segment length of 400 bytes:

```
Device# monitor capture mycap limit duration 60 packet-len 400
```

monitor capture match

To define an explicit inline core filter for a monitor (Wireshark) capture, use the **monitor capture match** command in privileged EXEC mode. To remove this filter, use the **no** form of this command.

```
monitor capture {capture-name} match {any | mac mac-match-string | ipv4 {any | host | protocol} {any | host} | ipv6 {any | host | protocol} {any | host}}
```

```
no monitor capture {capture-name} match
```

| Syntax Description | | |
|--------------------|------------------------------------|---|
| | <i>capture-name</i> | The name of the capture to be assigned a core filter. |
| | any | Specifies all packets. |
| | mac <i>mac-match-string</i> | Specifies a Layer 2 packet. |
| | ipv4 | Specifies IPv4 packets. |
| | host | Specifies the host. |
| | protocol | Specifies the protocol. |
| | ipv6 | Specifies IPv6 packets. |

Command Default A core filter is not configured.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

To define a capture point and the core filter for the capture point that matches to any IP version 4 packets on the source or destination:

```
Device# monitor capture mycap interface GigabitEthernet1/0/1 in  
Device# monitor capture mycap match ipv4 any any
```

monitor capture pktlen-range

To specify a range of packet lengths for packet capture, use the **monitor capture pktlen-range** command in the EXEC configuration mode. To remove the packet length range filter, use the **no** form of this command

```
monitor capture capture-name interface interface-id {in | out | both} match pktlen-range [max
packet-length-in bytes ] [min packet-length-in bytes ]
no monitor capture capture-name interface interface-id {in | out | both} match pktlen-range [max
packet-length-in bytes ] [min packet-length-in bytes ]
```

| | |
|---------------------------|--|
| Syntax Description | <i>packet-length-in bytes</i> Defines the length of the packet to be captured. The range is from 1-9216. |
|---------------------------|--|

| | |
|------------------------|--|
| Command Default | The default action is to have no packet length range for packet capture. |
|------------------------|--|

| | |
|----------------------|----------------------------|
| Command Modes | Global configuration mode. |
|----------------------|----------------------------|

| | | |
|------------------------|-------------------------------|-----------------------------|
| Command History | Release | Modification |
| | Cisco IOS XE Amsterdam 17.3.1 | The command was introduced. |

This example shows how to define a range of packet lengths for packet capture. In this example the maximum length of packet is set to 100 bytes and the minimum length of packet is set to 50 bytes.

```
Device(config)#mon cap cap1 int FortyGigabitEthernet 1/0/1 in match pktlen-range max 100
min 50
```

monitor capture start

To start the capture of packet data at a traffic trace point into a buffer, use the **monitor capture start** command in privileged EXEC mode.

monitor capture {*capture-name*} **start**

| | |
|---------------------------|--|
| Syntax Description | <i>capture-name</i> The name of the capture to be started. |
|---------------------------|--|

| | |
|------------------------|------------------------------------|
| Command Default | The buffer content is not cleared. |
|------------------------|------------------------------------|

| | |
|----------------------|-----------------|
| Command Modes | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | Use the monitor capture clear command to enable the packet data capture after the capture point is defined. To stop the capture of packet data, use the monitor capture stop command. |
|-------------------------|---|

Ensure that system resources such as CPU and memory are available before starting a capture.

Example

To start capturing buffer contents:

```
Device# monitor capture mycap start
```

monitor capture stop

To stop the capture of packet data at a traffic trace point, use the **monitor capture stop** command in privileged EXEC mode.

```
monitor capture { capture-name } stop
```

Syntax Description

capture-name The name of the capture to be stopped.

Command Default

The packet data capture is ongoing.

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **monitor capture stop** command to stop the capture of packet data that you started using the **monitor capture start** command. You can configure two types of capture buffers: linear and circular. When the linear buffer is full, data capture stops automatically. When the circular buffer is full, data capture starts from the beginning and the data is overwritten.

Example

To stop capturing buffer contents:

```
Device# monitor capture mycap stop
```

monitor session

To create a new Ethernet Switched Port Analyzer (SPAN) or a Remote Switched Port Analyzer (RSPAN) or Encapsulated Remote Switched Port Analyzer (ERSPAN) session configuration for analyzing traffic between ports or add to an existing session configuration, use the **monitor session** global configuration command. To clear sessions, use the **no** form of this command.

```
monitor session session-number {destination | filter | source | type {erspan-destination | erspan-source}}
```

```
no monitor session [session-number [destination | filter | source | type {erspan-destination | erspan-source}] | all | local | range session-range | remote]
```

| Syntax Description | | |
|--------------------|-----------------------------------|---|
| | <i>session-number</i> | The session number identified with the session. |
| | all | Clears all monitor sessions. |
| | local | Clears all local monitor sessions. |
| | range <i>session-range</i> | Clears monitor sessions in the specified range. |
| | remote | Clears all remote monitor sessions. |

Command Default No monitor sessions are configured.

Command Modes Global configuration

| Command History | Release | Modification |
|-----------------|--------------------------------|--|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.11.1 | The type { erspan-destination erspan-source } keywords were introduced. |

Usage Guidelines You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN, RSPAN, and ERSPAN sessions on a switch or switch stack.

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, FRSPAN, and ERSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Example

This example shows how to create a local SPAN session 1 to monitor traffic on Po13 (an EtherChannel port) and limit SPAN traffic in the session only to VLAN 1281. Egress traffic replicates the source; ingress forwarding is not enabled.

```
Device(config)# monitor session 1 source interface Po13
Device(config)# monitor session 1 filter vlan 1281
Device(config)# monitor session 1 destination interface GigabitEthernet2/0/36 encapsulation
```

```
replicate
```

```
Device(config)# monitor session 1 destination interface GigabitEthernet3/0/36 encapsulation  
replicate
```

The following is the output of a **show monitor session all** command after completing these setup instructions:

```
Device# show monitor session all  
  
Session 1  
-----  
Type                : Local Session  
Source Ports        :  
    Both            : Po13  
Destination Ports   : Gi2/0/36,Gi3/0/36  
    Encapsulation   : Replicate  
    Ingress         : Disabled  
Filter VLANs       : 1281  
...
```

monitor session destination

To start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) destination session, to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance), and to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, use the **monitor session destination** global configuration command. To remove the SPAN or RSPAN session or to remove destination interfaces from the SPAN or RSPAN session, use the **no** form of this command.

```
monitor session session-number destination {interface interface-id [, | -] [encapsulation
{replicate | dot1q} ] {ingress [dot1q | untagged] } | {remote} vlan vlan-id
no monitor session session-number destination {interface interface-id [, | -] [encapsulation
{replicate | dot1q} ] {ingress [dot1q | untagged] } | {remote} vlan vlan-id
```

Syntax Description

session-number

interface *interface-id*

Specifies the destination or source interface for the session. Valid interface types include physical ports (including type, stack member, and channel), VLANs, and EtherChannels. EtherChannel is also a valid interface type, and the

,

(Optional) Specifies a series of interfaces or VLANs from a previous range. Enter a space before a

-

(Optional) Specifies a range of interfaces or VLANs

encapsulation replicate

(Optional) Specifies that the destination interface replicates traffic. If not selected, the default is to send packets to the

destination interface. These keywords are valid only for local SPAN sessions. For RSPAN sessions, the original VLAN ID; therefore, packets are always sent to the original VLAN ID; therefore, packets are always ignored with the **no** form of the command.

encapsulation dot1q

(Optional) Specifies that the destination interface uses IEEE 802.1Q encapsulation.

These keywords are valid only for local SPAN sessions. For RSPAN sessions, the original VLAN ID; therefore, packets are always ignored with the **no** form of the command.

ingress

Enables ingress traffic forwarding.

dot1q

(Optional) Accepts incoming packets with IEEE 802.1Q encapsulation on the default VLAN.

untagged

(Optional) Accepts incoming packets with untagged frames on the default VLAN.

isl

Specifies ingress forwarding using ISL encapsulation.

remote

Specifies the remote VLAN for an RSPAN session. The remote VLAN must be in the range 1006 to 4094.

The RSPAN VLAN cannot be VLAN 1 (the default for Token Ring and FDDI VLANs).

| | |
|----------------------------|---|
| vlan <i>vlan-id</i> | Sets the default VLAN for ingress traffic |
|----------------------------|---|

Command Default

No monitor sessions are configured.

If **encapsulation replicate** is not specified on a local SPAN destination port, packets are sent in native form with no encapsulation tag.

Ingress forwarding is disabled on destination ports.

You can specify **all**, **local**, **range** *session-range*, or **remote** with the **no monitor session** command to clear all SPAN and RSPAN, all local SPAN, a range, or all RSPAN sessions.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A SPAN or RSPAN destination must be a physical port.

You can have a maximum of 64 destination ports on a switch or a switch stack.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, | -] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

EtherChannel ports can be configured as SPAN or RSPAN destination ports. A physical port that is a member of an EtherChannel group can be used as a destination port, but it cannot participate in the EtherChannel group while it is as a SPAN destination.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port; however, IEEE 802.1x authentication is disabled until the port is removed as a SPAN destination. If IEEE 802.1x authentication is not available on the port, the switch returns an error message. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

Destination ports can be configured to function in these ways:

- When you enter **monitor session** *session_number* **destination interface** *interface-id* with no other keywords, egress encapsulation is untagged, and ingress forwarding is not enabled.

- When you enter **monitor session** *session_number* **destination interface** *interface-id* **ingress**, egress encapsulation is untagged; ingress encapsulation depends on the keywords that follow—**dot1q** or **untagged**.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate** with no other keywords, egress encapsulation replicates the source interface encapsulation; ingress forwarding is not enabled. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate ingress**, egress encapsulation replicates the source interface encapsulation; ingress encapsulation depends on the keywords that follow—**dot1q** or **untagged**. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, and FRSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Examples

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2:

```
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 both
Device(config)# monitor session 1 destination interface gigabitethernet1/0/2
```

This example shows how to delete a destination port from an existing local SPAN session:

```
Device(config)# no monitor session 2 destination interface gigabitethernet1/0/2
```

This example shows how to configure RSPAN source session 1 to monitor a source interface and to configure the destination RSPAN VLAN 900:

```
Device(config)# monitor session 1 source interface gigabitethernet1/0/1
Device(config)# monitor session 1 destination remote vlan 900
Device(config)# end
```

This example shows how to configure an RSPAN destination session 10 in the switch receiving the monitored traffic:

```
Device(config)# monitor session 10 source remote vlan 900
Device(config)# monitor session 10 destination interface gigabitethernet1/0/2
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation. Egress traffic replicates the source; ingress traffic uses IEEE 802.1Q encapsulation.

```
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation
dot1q ingress dot1q vlan 5
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that does not support encapsulation. Egress traffic and ingress traffic are untagged.

```
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress untagged  
vlan 5
```

monitor session filter

To start a new flow-based SPAN (FSPAN) session or flow-based RSPAN (FRSPAN) source or destination session, or to limit (filter) SPAN source traffic to specific VLANs, use the **monitor session filter** global configuration command. To remove filters from the SPAN or RSPAN session, use the **no** form of this command.

```
monitor session session-number filter {vlan vlan-id [, | -] }
no monitor session session-number filter {vlan vlan-id [, | -] }
```

Syntax Description

session-number

vlan *vlan-id*

Specifies a list of VLANs as filters on trunk source ports to limit SPAN traffic to specific VLANs. The *vlan-id* range is 1 to 4094.

,

(Optional) Specifies a series of VLANs, or separates a range of VLANs. Enter a space before and after the comma.

-

(Optional) Specifies a range of VLANs. Enter a space before and after the hyphen.

Command Default

No monitor sessions are configured.

Command Modes

Global configuration

Command History

Release

Modification

Cisco IOS XE Everest 16.6.1

This command was introduced.

Usage Guidelines

You can monitor traffic on a single VLAN or on a series or range of ports or VLANs. You select a series or range of VLANs by using the [, | -] options.

If you specify a series of VLANs, you must enter a space before and after the comma. If you specify a range of VLANs, you must enter a space before and after the hyphen (-).

VLAN filtering refers to analyzing network traffic on a selected set of VLANs on trunk source ports. By default, all VLANs are monitored on trunk source ports. You can use the **monitor session *session-number* filter vlan *vlan-id*** command to limit SPAN traffic on trunk source ports to only the specified VLANs.

VLAN monitoring and VLAN filtering are mutually exclusive. If a VLAN is a source, VLAN filtering cannot be enabled. If VLAN filtering is configured, a VLAN cannot become a source.

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, and FRSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Examples

This example shows how to limit SPAN traffic in an existing session only to specific VLANs:

```
Switch(config)# monitor session 1 filter vlan 100 - 110
```

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2 and to filter IPv4 traffic using access list number 122 in an FSPAN session:

```
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 both
Device(config)# monitor session 1 destination interface gigabitethernet1/0/2
Device(config)# monitor session 1 filter ip access-group 122
```

monitor session source

To start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) source session, or to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, use the **monitor session source** global configuration command. To remove the SPAN or RSPAN session or to remove source interfaces from the SPAN or RSPAN session, use the **no** form of this command.

```
monitor session session_number source {interface interface-id [, | -] [both | rx | tx] |
[remote] vlan vlan-id [, | -] [both | rx | tx] }
no monitor session session_number source {interface interface-id [, | -] [both | rx | tx] |
[remote] vlan vlan-id [, | -] [both | rx | tx] }
```

Syntax Description

| | |
|--------------------------------------|---|
| <i>session_number</i> | |
| interface <i>interface-id</i> | Specifies the source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type, stack member, module, and port number). For source interface, port channel is also a valid interface type, and the valid range is 1 to 48. |
| , | (Optional) Specifies a series of interfaces or VLANs, or separates a range of interfaces or VLANs from a previous range. Enter a space before and after the comma. |
| - | (Optional) Specifies a range of interfaces or VLANs. Enter a space before and after the hyphen. |
| both rx tx | (Optional) Specifies the traffic direction to monitor. If you do not specify a traffic direction, the source interface sends both transmitted and received traffic. |
| remote | (Optional) Specifies the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094. The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs). |
| vlan <i>vlan-id</i> | When used with only the ingress keyword, sets default VLAN for ingress traffic. |

Command Default

No monitor sessions are configured.

On a source interface, the default is to monitor both received and transmitted traffic.

On a trunk interface used as a source port, all VLANs are monitored.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Traffic that enters or leaves source ports or source VLANs can be monitored by using SPAN or RSPAN. Traffic routed to source ports or source VLANs cannot be monitored.

A source can be a physical port, a port channel, or a VLAN.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, | -] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

You can monitor individual ports while they participate in an EtherChannel, or you can monitor the entire EtherChannel bundle by specifying the **port-channel** number as the RSPAN source interface.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, and FRSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Examples

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2:

```
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1 both
Switch(config)# monitor session 1 destination interface gigabitethernet1/0/2
```

This example shows how to configure RSPAN source session 1 to monitor multiple source interfaces and to configure the destination RSPAN VLAN 900.

```
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1
Switch(config)# monitor session 1 source interface port-channel 2 tx
Switch(config)# monitor session 1 destination remote vlan 900
Switch(config)# end
```

monitor session type

To configure a local Encapsulated Remote Switched Port Analyzer (ERSPAN) session, use the **monitor session type** command in global configuration mode. To remove the ERSPAN configuration, use the **no** form of this command.

```
monitor session span-session-number type {erspan-destination | erspan-source}
no monitor session span-session-number type {erspan-destination | erspan-source}
```

Syntax Description

| | |
|----------------------------|--|
| <i>span-session-number</i> | Number of the local ERSPAN session. Valid values are from 1 to 66. |
|----------------------------|--|

Command Default

ERSPAN source or destination session is not configured.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|--------------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Gibraltar 16.11.1 | The erspan-destination keyword was introduced. |

Usage Guidelines

The *span-session-number* and the session type cannot be changed once configured. Use the **no** form of this command to remove the session and then re-create the session with a new session ID or a new session type.

The ERSPAN source session destination IP address, which must be configured on an interface on the destination switch, is the source of traffic that an ERSPAN destination session sends to the destination ports. You can configure the same address in both the source and destination sessions with the **ip address** command in ERSPAN monitor destination session configuration mode.

A newly configured ERSPAN session will be in the **shutdown** state by default. The ERSPAN session remains inactive until the **no shutdown** command is configured along with other mandatory configurations such as source interface, ERSPAN ID, ERSPAN IP address, and so on.

The ERSPAN ID differentiates the ERSPAN traffic arriving at the same destination IP address from different ERSPAN source sessions.

The maximum local ERSPAN source session limit is 8.

Examples

The following example shows how to configure an ERSPAN source session number:

```
Device(config)# monitor session 55 type erspan-source
Device(config-mon-erspan-src)#
```

Related Commands

| Command | Description |
|--|---|
| monitor session type | Creates an ERSPAN source or destination session number or enters the ERSPAN session configuration mode for the session. |
| show capability feature monitor | Displays information about monitor features. |

| Command | Description |
|-----------------------------|--|
| show monitor session | Displays information about the ERSPAN, SPAN, and RSPAN sessions. |

option

To configure optional data parameters for a flow exporter for Flexible NetFlow, use the **option** command in flow exporter configuration mode. To remove optional data parameters for a flow exporter, use the **no** form of this command.

option {**exporter-stats** | **interface-table** | **sampler-table**} [{**timeout** *seconds*}]
no option {**exporter-stats** | **interface-table** | **sampler-table**}

| Syntax Description | | |
|--------------------|-------------------------------|--|
| | exporter-stats | Configures the exporter statistics option for flow exporters. |
| | interface-table | Configures the interface table option for flow exporters. |
| | sampler-table | Configures the export sampler table option for flow exporters. |
| | timeout <i>seconds</i> | (Optional) Configures the option resend time in seconds for flow exporters. The range is 1 to 86400. The default is 600. |

Command Default The timeout is 600 seconds. All other optional data parameters are not configured.

Command Modes Flow exporter configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **option exporter-stats** command causes the periodic sending of the exporter statistics, including the number of records, bytes, and packets sent. This command allows the collector to estimate packet loss for the export records it receives. The optional timeout alters the frequency at which the reports are sent.

The **option interface-table** command causes the periodic sending of an options table, which allows the collector to map the interface SNMP indexes provided in the flow records to interface names. The optional timeout can alter the frequency at which the reports are sent.

The **option sampler-table** command causes the periodic sending of an options table, which details the configuration of each sampler and allows the collector to map the sampler ID provided in any flow record to a configuration that it can use to scale up the flow statistics. The optional timeout can alter the frequency at which the reports are sent.

To return this command to its default settings, use the **no option** or **default option** flow exporter configuration command.

The following example shows how to enable the periodic sending of the sampler option table, which allows the collector to map the sampler ID to the sampler type and rate:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# option sampler-table
```

The following example shows how to enable the periodic sending of the exporter statistics, including the number of records, bytes, and packets sent:

```
Device(config)# flow exporter FLOW-EXPORTER-1  
Device(config-flow-exporter)# option exporter-stats
```

The following example shows how to enable the periodic sending of an options table, which allows the collector to map the interface SNMP indexes provided in the flow records to interface names:

```
Device(config)# flow exporter FLOW-EXPORTER-1  
Device(config-flow-exporter)# option interface-table
```

record

To add a flow record for a Flexible NetFlow flow monitor, use the **record** command in flow monitor configuration mode. To remove a flow record for a Flexible NetFlow flow monitor, use the **no** form of this command.

record *record-name*
no record

| | |
|---------------------------|---|
| Syntax Description | <i>record-name</i> Name of a user-defined flow record that was previously configured. |
|---------------------------|---|

| | |
|------------------------|----------------------------------|
| Command Default | A flow record is not configured. |
|------------------------|----------------------------------|

| | |
|----------------------|----------------------------|
| Command Modes | Flow monitor configuration |
|----------------------|----------------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | Each flow monitor requires a record to define the contents and layout of its cache entries. The flow monitor can use one of the wide range of predefined record formats, or advanced users may create their own record formats. |
|-------------------------|---|

| | |
|-------------|--|
| Note | You must use the no ip flow monitor command to remove a flow monitor from all of the interfaces to which you have applied it before you can modify the parameters for the record command for the flow monitor. |
|-------------|--|

Examples

The following example configures the flow monitor to use FLOW-RECORD-1:

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# record FLOW-RECORD-1
```

show flow monitor etta-mon cache

To display ETA monitor cache details, use the **show flow monitor etta-mon cache** command in privileged EXEC mode.

show flow monitor etta-mon cache

Command Default

None

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example:

The following example shows how to display ETA flow monitor cache details:

```
Device>enable
Device#configure terminal
Device# show flow monitor etta-mon cache
Cache type: Normal (Platform cache)
Cache size: 10000
Current entries: 4
Flows added: 6
Flows aged: 2
- Inactive timeout ( 15 secs) 2
IPV4 DESTINATION ADDRESS: 15.15.15.35
IPV4 SOURCE ADDRESS: 72.163.128.140
IP PROTOCOL: 17
TRNS SOURCE PORT: 53
TRNS DESTINATION PORT: 12032
counter bytes long: 128
counter packets long: 1
timestamp abs first: 06:23:24.799
timestamp abs last: 06:23:24.799
interface input: Null
interface output: Null
```

sampler

To create a Flexible Netflow flow sampler, or to modify an existing Flexible Netflow flow sampler, and to enter Flexible Netflow sampler configuration mode, use the **sampler** command in global configuration mode. To remove a sampler, use the **no** form of this command.

sampler *sampler-name*

no sampler *sampler-name*

| | |
|---------------------------|---|
| Syntax Description | <i>sampler-name</i> Name of the flow sampler that is being created or modified. |
|---------------------------|---|

| | |
|------------------------|--|
| Command Default | Flexible Netflow flow samplers are not configured. |
|------------------------|--|

| | |
|----------------------|----------------------|
| Command Modes | Global configuration |
|----------------------|----------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | Flow samplers are used to reduce the load placed by Flexible Netflow on the networking device to monitor traffic by limiting the number of packets that are analyzed. You configure a rate of sampling that is 1 out of a range of packets. Flow samplers are applied to interfaces in conjunction with a flow monitor to implement sampled Flexible Netflow. |
|-------------------------|---|

To enable flow sampling, you configure the record that you want to use for traffic analysis and assign it to a flow monitor. When you apply a flow monitor with a sampler to an interface, the sampled packets are analyzed at the rate specified by the sampler and compared with the flow record associated with the flow monitor. If the analyzed packets meet the criteria specified by the flow record, they are added to the flow monitor cache.

Examples

The following example creates a flow sampler name SAMPLER-1:

```
Device(config)# sampler SAMPLER-1
Device(config-sampler)#
```

show capability feature monitor

To display information about monitor features, use the **show capability feature monitor** command in privileged EXEC mode.

show capability feature monitor {erspan-destination | erspan-source}

| Syntax Description | erspan-destination | erspan-source |
|--------------------|--|--|
| | Displays information about the configured Encapsulated Remote Switched Port Analyzer (ERSPAN) source sessions. | Displays all the configured global built-in templates. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output from the **show capability feature monitor erspan-source** command:

```
Switch# show capability feature monitor erspan-source

ERSPAN Source Session Supported: true
No of Rx ERSPAN source session: 8
No of Tx ERSPAN source session: 8
ERSPAN Header Type supported: II
ACL filter Supported: true
Fragmentation Supported: true
Truncation Supported: false
Sequence number Supported: false
QOS Supported: true
```

The following is sample output from the **show capability feature monitor erspan-destination** command:

```
Switch# show capability feature monitor erspan-destination

ERSPAN Destination Session Supported: false
```

| Related Commands | Command | Description |
|------------------|---|--|
| | monitor session type erspan-source | Creates an ERSPAN source session number or enters the ERSPAN session configuration mode for the session. |

show class-map type control subscriber

To display the class map statistics for the configured control policies, use the **show class-map type control subscriber** command in privileged EXEC mode.

show class-map type control subscriber {all | name *control-class-name*}

| | | |
|---------------------------|---------------------------------------|---|
| Syntax Description | all | Displays class map statistics for all control policies. |
| | name <i>control-class-name</i> | Displays class map statistics for the specified control policy. |
| Command Modes | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is a sample output of the **show class-map type control subscriber name control-class-name** command:

```
Device# show class-map type control subscriber name platform

Class-map          Action          Exec  Hit  Miss  Comp
-----          -
match-all platform  match platform-type C9xxx  0    0    0    0
Key:
  "Exec" - The number of times this line was executed
  "Hit"  - The number of times this line evaluated to TRUE
  "Miss" - The number of times this line evaluated to FALSE
  "Comp" - The number of times this line completed the execution of its
           condition without a need to continue on to the end
```

show flow exporter

To display flow exporter status and statistics, use the **show flow exporter** command in privileged EXEC mode.

```
show flow exporter [{export-ids netflow-v9 | [name] exporter-name [{statistics | templates}]] | statistics | templates}]
```

| Syntax Description | |
|------------------------------|---|
| export-ids netflow-v9 | (Optional) Displays the NetFlow Version 9 export fields that can be exported and their IDs. |
| name | (Optional) Specifies the name of a flow exporter. |
| <i>exporter-name</i> | (Optional) Name of a flow exporter that was previously configured. |
| statistics | (Optional) Displays statistics for all flow exporters or for the specified flow exporter. |
| templates | (Optional) Displays template information for all flow exporters or for the specified flow exporter. |

Command Default None

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

The following example displays the status and statistics for all of the flow exporters configured on a device:

```
Device# show flow exporter
Flow Exporter FLOW-EXPORTER-1:
  Description:           Exports to the datacenter
  Export protocol:       NetFlow Version 9
  Transport Configuration:
    Destination IP address: 192.168.0.1
    Source IP address:     192.168.0.2
    Transport Protocol:    UDP
    Destination Port:      9995
    Source Port:           55864
    DSCP:                  0x0
    TTL:                   255
    Output Features:       Used
```

This table describes the significant fields shown in the display:

Table 129: show flow exporter Field Descriptions

| Field | Description |
|---------------|--|
| Flow Exporter | The name of the flow exporter that you configured. |

| Field | Description |
|-------------------------|--|
| Description | The description that you configured for the exporter, or the default description User defined. |
| Transport Configuration | The transport configuration fields for this exporter. |
| Destination IP address | The IP address of the destination host. |
| Source IP address | The source IP address used by the exported packets. |
| Transport Protocol | The transport layer protocol used by the exported packets. |
| Destination Port | The destination UDP port to which the exported packets are sent. |
| Source Port | The source UDP port from which the exported packets are sent. |
| DSCP | The differentiated services code point (DSCP) value. |
| TTL | The time-to-live value. |
| Output Features | Specifies whether the output-features command, which causes the output features to be run on Flexible NetFlow export packets, has been used or not. |

The following example displays the status and statistics for all of the flow exporters configured on a device:

```
Device# show flow exporter name FLOW-EXPORTER-1 statistics
Flow Exporter FLOW-EXPORTER-1:
  Packet send statistics (last cleared 2w6d ago):
    Successfully sent:          0                (0 bytes)
```

show flow interface

To display the Flexible Netflow configuration and status for an interface, use the **show flow interface** command in privileged EXEC mode.

show flow interface [*type number*]

Syntax Description

type (Optional) The type of interface on which you want to display Flexible Netflow accounting configuration information.

number (Optional) The number of the interface on which you want to display Flexible Netflow accounting configuration information.

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example displays the Flexible Netflow accounting configuration on Ethernet interfaces 0/0 and 0/1:

```
Device# show flow interface gigabitethernet1/0/1

Interface Ethernet1/0
  monitor:          FLOW-MONITOR-1
  direction:        Output
  traffic(ip):      on
Device# show flow interface gigabitethernet1/0/2
Interface Ethernet0/0
  monitor:          FLOW-MONITOR-1
  direction:        Input
  traffic(ip):      sampler SAMPLER-2#
```

The table below describes the significant fields shown in the display.

Table 130: show flow interface Field Descriptions

| Field | Description |
|------------|--|
| Interface | The interface to which the information applies. |
| monitor | The name of the flow monitor that is configured on the interface. |
| direction: | The direction of traffic that is being monitored by the flow monitor. The possible values are: <ul style="list-style-type: none"> • Input—Traffic is being received by the interface. • Output—Traffic is being transmitted by the interface. |

| Field | Description |
|-------------|--|
| traffic(ip) | <p data-bbox="467 296 1162 323">Indicates if the flow monitor is in normal mode or sampler mode.</p> <p data-bbox="467 342 724 369">The possible values are:</p> <ul data-bbox="505 388 1479 499" style="list-style-type: none"><li data-bbox="505 388 964 415">• on—The flow monitor is in normal mode.<li data-bbox="505 438 1479 499">• sampler—The flow monitor is in sampler mode (the name of the sampler will be included in the display). |

show flow monitor

To display the status and statistics for a Flexible NetFlow flow monitor, use the **show flow monitor** command in privileged EXEC mode.

| Syntax Description | name | (Optional) Specifies the name of a flow monitor. |
|--------------------|---------------------|--|
| | <i>monitor-name</i> | (Optional) Name of a flow monitor that was previously configured. |
| | cache | (Optional) Displays the contents of the cache for the flow monitor. |
| | format | (Optional) Specifies the use of one of the format options for formatting the display output. |
| | csv | (Optional) Displays the flow monitor cache contents in comma-separated variables (CSV) format. |
| | record | (Optional) Displays the flow monitor cache contents in record format. |
| | table | (Optional) Displays the flow monitor cache contents in table format. |
| | statistics | (Optional) Displays the statistics for the flow monitor. |

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **cache** keyword uses the record format by default.

The uppercase field names in the display output of the **show flowmonitor** *monitor-name* **cache** command are key fields that Flexible netFlow uses to differentiate flows. The lowercase field names in the display output of the **show flow monitor** *monitor-name* **cache** command are nonkey fields from which Flexible NetFlow collects values as additional data for the cache.

Examples

The following example displays the status for a flow monitor:

```
Device# show flow monitor FLOW-MONITOR-1

Flow Monitor FLOW-MONITOR-1:
  Description:      Used for basic traffic analysis
  Flow Record:     flow-record-1
  Flow Exporter:   flow-exporter-1
                  flow-exporter-2

Cache:
  Type:            normal
  Status:          allocated
  Size:            4096 entries / 311316 bytes
  Inactive Timeout: 15 secs
  Active Timeout:  1800 secs
```

This table describes the significant fields shown in the display.

Table 131: show flow monitor monitor-name Field Descriptions

| Field | Description |
|------------------|---|
| Flow Monitor | Name of the flow monitor that you configured. |
| Description | Description that you configured or the monitor, or the default description User defined. |
| Flow Record | Flow record assigned to the flow monitor. |
| Flow Exporter | Exporters that are assigned to the flow monitor. |
| Cache | Information about the cache for the flow monitor. |
| Type | Flow monitor cache type. The value is always normal, as it is the only supported cache type. |
| Status | Status of the flow monitor cache. The possible values are: <ul style="list-style-type: none"> • allocated—The cache is allocated. • being deleted—The cache is being deleted. • not allocated—The cache is not allocated. |
| Size | Current cache size. |
| Inactive Timeout | Current value for the inactive timeout in seconds. |
| Active Timeout | Current value for the active timeout in seconds. |

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1:

This table describes the significant fields shown in the display.

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1 in a table format:

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-IPv6 (the cache contains IPv6 data) in record format:

The following example displays the status and statistics for a flow monitor:

show flow record

To display the status and statistics for a Flexible Netflow flow record, use the **show flow record** command in privileged EXEC mode.

```
show flow record [{name] record-name}]
```

| | |
|---------------------------|--|
| Syntax Description | name (Optional) Specifies the name of a flow record. |
| | <i>record-name</i> (Optional) Name of a user-defined flow record that was previously configured. |
| Command Default | None |
| Command Modes | Privileged EXEC |
| Command History | Release |
| | Modification |
| | Cisco IOS XE Everest 16.6.1 |
| | This command was introduced. |

The following example displays the status and statistics for FLOW-RECORD-1:

```
Device# show flow record FLOW-RECORD-1
flow record FLOW-RECORD-1:
  Description:      User defined
  No. of users:    0
  Total field space: 24 bytes
  Fields:
    match ipv6 destination address
    match transport source-port
    collect interface input
```

show ip sla statistics

To display current or aggregated operational status and statistics of all Cisco IOS IP Service Level Agreement (SLA) operations or a specified operation, use the **show ip sla statistics** command in user EXEC or privileged EXEC mode.

show ip sla statistics [*operation-number* [**details**]] | **aggregated** [*operation-number* | **details**] | **details**]

| Syntax Description | | |
|--------------------|-------------------------|---|
| | <i>operation-number</i> | (Optional) Number of the operation for which operational status and statistics are displayed. Accepted values are from 1 to 2147483647. |
| | details | (Optional) Specifies detailed output. |
| | aggregated | (Optional) Specifies the IP SLA aggregated statistics. |

Command Default Displays output for all running IP SLA operations.

Command Modes User EXEC
Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **show ip sla statistics** to display the current state of IP SLA operations, including how much life the operation has left, whether the operation is active, and the completion time. The output also includes the monitoring data returned for the last (most recently completed) operation. This generated operation ID is displayed when you use the **show ip sla** configuration command for the base multicast operation, and as part of the summary statistics for the entire operation.

Enter the **show** command for a specific operation ID to display details for that one responder.

Examples

The following is sample output from the **show ip sla statistics** command:

```
Device# show ip sla statistics

Current Operational State
Entry Number: 3
Modification Time: *22:15:43.000 UTC Sun Feb 11 2001
Diagnostics Text:
Last Time this Entry was Reset: Never
Number of Octets in use by this Entry: 1332
Number of Operations Attempted: 2
Current Seconds Left in Life: 3511
Operational State of Entry: active
Latest Completion Time (milliseconds): 544
Latest Operation Start Time: *22:16:43.000 UTC Sun Feb 11 2001
Latest Oper Sense: ok
Latest Sense Description: 200 OK
```

```
Total RTT: 544  
DNS RTT: 12  
TCP Connection RTT: 28  
HTTP Transaction RTT: 504  
HTTP Message Size: 9707
```

show monitor

To display information about all Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) sessions, use the **show monitor** command in EXEC mode.

show monitor [**session** {*session_number* | **all** | **local** | **range list** | **remote**} [**detail**]]

Syntax Description

| | |
|-----------------------|--|
| session | (Optional) Displays information about specified SPAN sessions. |
| <i>session_number</i> | |
| all | (Optional) Displays all SPAN sessions. |
| local | (Optional) Displays only local SPAN sessions. |
| range list | (Optional) Displays a range of SPAN sessions, where <i>list</i> is the range of valid sessions. The range is either a single session or a range of sessions described by two numbers, the lower one first, separated by a hyphen. Do not enter any spaces between comma-separated parameters or in hyphen-specified ranges. Note This keyword is available only in privileged EXEC mode. |
| remote | (Optional) Displays only remote SPAN sessions. |
| detail | (Optional) Displays detailed information about the specified sessions. |

Command Modes

User EXEC
Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The output is the same for the **show monitor** command and the **show monitor session all** command.

Examples

This is an example of output for the **show monitor** user EXEC command:

```
Device# show monitor
Session 1
-----
Type : Local Session
Source Ports :
```

```
RX Only : Gi4/0/1
Both : Gi4/0/2-3,Gi4/0/5-6
Destination Ports : Gi4/0/20
Encapsulation : Replicate
Ingress : Disabled
Session 2
-----
Type : Remote Source Session
Source VLANs :
TX Only : 10
Both : 1-9
Dest RSPAN VLAN : 105
```

This is an example of output for the **show monitor** user EXEC command for local SPAN source session 1:

```
Device# show monitor session 1
Session 1
-----
Type : Local Session
Source Ports :
RX Only : Gi4/0/1
Both : Gi4/0/2-3,Gi4/0/5-6
Destination Ports : Gi4/0/20
Encapsulation : Replicate
Ingress : Disabled
```

This is an example of output for the **show monitor session all** user EXEC command when ingress traffic forwarding is enabled:

```
Device# show monitor session all
Session 1
-----
Type : Local Session
Source Ports :
Both : Gi4/0/2
Destination Ports : Gi4/0/3
Encapsulation : Native
Ingress : Enabled, default VLAN = 5
Ingress encap : DOT1Q
Session 2
-----
Type : Local Session
Source Ports :
Both : Gi4/0/8
Destination Ports : Gi4/0/12
Encapsulation : Replicate
Ingress : Enabled, default VLAN = 4
Ingress encap : Untagged
```

show monitor capture

To display monitor capture (WireShark) content, use the **show monitor capture** command in privileged EXEC mode.

show monitor capture [*capture-name* [**buffer**] | **file** *file-location* : *file-name*][**brief** | **detailed** | **display-filter** *display-filter-string*]

| Syntax Description | | |
|---|-------------------------------|---|
| capture-name | (Optional) | Specifies the name of the capture to be displayed. |
| buffer | (Optional) | Specifies that a buffer associated with the named capture is to be displayed. |
| file <i>file-location</i> : <i>file-name</i> | (Optional) | Specifies the file location and name of the capture storage file to be displayed. |
| brief | (Optional) | Specifies the display content in brief. |
| detailed | (Optional) | Specifies detailed display content. |
| display-filter <i>display-filter-string</i> | | Filters the display content according to the <i>display-filter-string</i> . |
| Command Default | Displays all capture content. | |
| Command Modes | Privileged EXEC | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example

The following is sample output from the **show monitor capture** command:

```
Device# show monitor capture mycap

Status Information for Capture mycap
  Target Type:
  Interface: CAPWAP,
    Ingress:
  0
    Egress:
  0
  Status : Active
  Filter Details:
    Capture all packets
  Buffer Details:
    Buffer Type: LINEAR (default)
  File Details:
    Associated file name: flash:mycap.pcap
    Size of buffer(in MB): 1
  Limit Details:
    Number of Packets to capture: 0 (no limit)
```

```
Packet Capture duration: 0 (no limit)
Packet Size to capture: 0 (no limit)
Packets per second: 0 (no limit)
Packet sampling rate: 0 (no sampling)
```

show monitor session

To display information about Switched Port Analyzer (SPAN), Remote SPAN (RSPAN), and Encapsulated Remote Switched Port Analyzer (ERSPAN) sessions, use the **show monitor session** command in EXEC mode.

show monitor session {*session_number* | **all** | **erspan-destination** | **erspan-source** | **local** | **range list** | **remote**} [**detail**]

| Syntax Description | | |
|--------------------|---------------------------|--|
| | <i>session_number</i> | The session number identified with the session. |
| | all | Displays all SPAN sessions. |
| | erspan-source | Displays only source ERSPAN sessions. |
| | erspan-destination | Displays only destination ERSPAN sessions. |
| | local | Displays only local SPAN sessions. |
| | range list | Displays a range of SPAN sessions, where <i>list</i> is a range of sessions described by two numbers, a hyphen, comma-separated parameters or in hyphen notation. Note This keyword is available only on Catalyst 9400 switches. |
| | remote | Displays only remote SPAN sessions. |
| | detail | (Optional) Displays detailed information about the session. |

| Command Modes | |
|---------------|--------------------|
| | User EXEC (>) |
| | Privileged EXEC(#) |

| Command History | Release | Modification |
|-----------------|--------------------------------|---|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.11.1 | The erspan-destination keyword was introduced. |

Usage Guidelines The maximum local ERSPAN source session limit is 8.

Examples

The following is sample output from the **show monitor session** command for local SPAN source session 1:

```
Device# show monitor session 1
Session 1
-----
Type : Local Session
Source Ports :
```

```

RX Only : Gi4/0/1
Both : Gi4/0/2-3,Gi4/0/5-6
Destination Ports : Gi4/0/20
Encapsulation : Replicate
Ingress : Disabled

```

The following is sample output from the **show monitor session all** command when ingress traffic forwarding is enabled:

```

Device# show monitor session all
Session 1
-----
Type : Local Session
Source Ports :
Both : Gi4/0/2
Destination Ports : Gi4/0/3
Encapsulation : Native
Ingress : Enabled, default VLAN = 5
Ingress encap : DOT1Q
Session 2
-----
Type : Local Session
Source Ports :
Both : Gi4/0/8
Destination Ports : Gi4/0/12
Encapsulation : Replicate
Ingress : Enabled, default VLAN = 4
Ingress encap : Untagged

```

The following is sample output from the **show monitor session erspan-source** command:

```

Device# show monitor session erspan-source

Type : ERSPAN Source Session
Status : Admin Enabled
Source Ports :
RX Only : Gi1/4/33
Destination IP Address : 20.20.163.20
Destination ERSPAN ID : 110
Origin IP Address : 10.10.10.216
IPv6 Flow Label : None

```

The following is sample output from the **show monitor session erspan-destination** command:

```

Device# show monitor session erspan-destination

Type : ERSPAN Destination Session
Status : Admin Enabled
Source IP Address : 10.10.10.210
Source ERSPAN ID : 40

```

show parameter-map type subscriber attribute-to-service

To display parameter map statistics, use the **show parameter-map type subscriber attribute-to-service** command in privileged EXEC mode.

show parameter-map type subscriber attribute-to-service {all | name *parameter-map-name*}

| | | |
|---------------------------|---------------------------------------|--|
| Syntax Description | all | Displays statistics for all parameter maps. |
| | name <i>parameter-map-name</i> | Displays statistics for the specified parameter map. |
| Command Modes | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is a sample output of the **show parameter-map type subscriber attribute-to-service name *parameter-map-name*** command:

```
Device# show parameter-map type subscriber attribute-to-service name platform
```

```
Parameter-map name: platform
Map: 10 platform-type regex "C9xxx"
Action(s):
    10 interface-template critical
```

show platform software et-analytics

To display et-analytics configuration, use the **show platform software et-analytics** command in privileged EXEC mode.

show platform software et-analytics {global | interfaces}

| | | |
|---------------------------|-----------------------------|--|
| Syntax Description | global | Displays global et-analytics configuration. |
| | interfaces | Displays interface et-analytics configuration. |
| Command Default | None | |
| Command Modes | Privileged EXEC | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example:

The following example shows how to display global et-analytics configuration:

```
Device>enable
Device#configure terminal
Device# show platform software et-analytics global

ET-Analytics Global state
=====
All Interfaces : Off
IP Flow-record Destination: 10.126.71.20 : 2055
Inactive timer: 0
ET-Analytics interfaces
GigabitEthernet1/0/3
```

The following example shows how to display global et-analytics configuration:

```
Device>enable
Device#configure terminal
Device# show platform software et-analytics interfaces

ET-Analytics interfaces
GigabitEthernet1/0/3
```

show platform software fed switch active fnf et-analytics-flow-dump

To display interface et-analytics flow dump, use the **show platform software fed switch active fnf et-analytics-flow-dump** command in privileged EXEC mode.

show platform software fed switch active fnf et-analytics-flow-dump

| | | |
|------------------------|-----------------------------|------------------------------|
| Command Default | None | |
| Command Modes | Privileged EXEC | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example:

The following example shows how to display interface et-analytics flow dump.:

```
Device>enable
Device#configure terminal
Device# show platform software fed switch active fnf et-analytics-flow-dump

ET Analytics Flow dump

```

show platform software fed switch ip wccp

To display platform-dependent Web Cache Communication Protocol (WCCP) information, use the **show platform software fed switch ip wccp** privileged EXEC command.

```
show platform software fed switch{switch-number|active|standby}ip
wccp{cache-engines |interfaces |service-groups}
```

Syntax Description

switch{*switch_num* | **active** | **standby**} The device for which you want to display information.

- *switch_num*—Enter the switch ID. Displays information for the specified switch.
- **active**—Displays information for the active switch.
- **standby**—Displays information for the standby switch, if available.

cache-engines Displays WCCP cache engines.

interfaces Displays WCCP interfaces.

service-groups Displays WCCP service groups.

Command Modes

Modification

Cisco IOS XE Everest 16.6.1

This command was introduced.

Usage Guidelines

Use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

This command is available only if your device is running the IP Services feature set.

The following example displays WCCP interfaces:

```
Device# show platform software fed switch 1 ip wccp interfaces
```

```
WCCP Interface Info
```

```
=====
```

```
**** WCCP Interface: Port-channel13 iif_id: 000000000000007c (#SG:3), VRF: 0 Ingress WCCP

```

show platform software swspan

To display switched port analyzer (SPAN) information, use the **show platform software swspan** command in privileged EXEC mode.

show platform software swspan {switch} {{{F0 | FP active} counters} | R0 | RP active} {destination sess-id *session-ID* | source sess-id *session-ID*}

| Syntax Description | | |
|--|--|--|
| switch | | Displays information about the switch. |
| F0 | | Displays information about the Embedded Service Processor (ESP) slot 0. |
| FP | | Displays information about the ESP. |
| active | | Displays information about the active instance of the ESP or the Route Processor (RP). |
| counters | | Displays the SWSPAN message counters. |
| R0 | | Displays information about the RP slot 0. |
| RP | | Displays information the RP. |
| destination sess-id <i>session-ID</i> | | Displays information about the specified destination session. |
| source sess-id <i>session-ID</i> | | Displays information about the specified source session. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|---|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced in a release prior to Cisco IOS XE Denali 16.1.1. |

Usage Guidelines If the session number does not exist or if the SPAN session is a remote destination session, the command output will display the following message "% Error: No Information Available."

Examples

The following is sample output from the **show platform software swspan FP active source** command:

```
Switch# show platform software swspan FP active source sess-id 0

Showing SPAN source detail info

Session ID : 0
Intf Type : PORT
Port dpidx : 30
PD Sess ID : 1
Session Type : Local
Direction : Ingress

AOM Object id : 579
```

```
AOM Object Status : Done
Parent AOM object Id : 118
Parent AOM object Status : Done
```

```
Session ID : 9
Intf Type : PORT
Port dpidx : 8
PD Sess ID : 0
Session Type : Local
Direction : Ingress
Filter Enabled : No
ACL Configured : No
AOM Object id : 578
AOM Object Status : Done
Parent AOM object Id : 70
Parent AOM object Status : Done
```

The following is sample output from the **show platform software swspan RP active destination** command:

```
Switch# show platform software swspan RP active destination
```

```
Showing SPAN destination table summary info
```

```
Sess-id IF-type IF-id Sess-type
-----
1 PORT 19 Remote
```

show sampler

To display the status and statistics for a Flexible NetFlow sampler, use the **show sampler** command in privileged EXEC mode.

```
show sampler [{[name] sampler-name}]
```

| Syntax Description | name (Optional) Specifies the name of a sampler. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| | sampler-name (Optional) Name of a sampler that was previously configured. | | | | |
| Command Default | None | | | | |
| Command Modes | Privileged EXEC | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

The following example displays the status and statistics for all of the flow samplers configured:

```
Device# show sampler
Sampler SAMPLER-1:
  ID:                2083940135
  export ID:         0
  Description:       User defined
  Type:              Invalid (not in use)
  Rate:              1 out of 32
  Samples:           0
  Requests:          0
  Users (0):
  Users (0):

Sampler SAMPLER-2:
  ID:                3800923489
  export ID:         1
  Description:       User defined
  Type:              random
  Rate:              1 out of 100
  Samples:           1
  Requests:          124
  Users (1):
  Users (1):
    flow monitor FLOW-MONITOR-1 (datalink,vlan1) 0 out of 0
```

This table describes the significant fields shown in the display.

Table 132: show sampler Field Descriptions

| Field | Description |
|-----------|--------------------------------|
| ID | ID number of the flow sampler. |
| Export ID | ID of the flow sampler export. |

| Field | Description |
|-------------|---|
| Description | Description that you configured for the flow sampler, or the default description User defined. |
| Type | Sampling mode that you configured for the flow sampler. |
| Rate | Window size (for packet selection) that you configured for the flow sampler. The range is 2 to 32768. |
| Samples | Number of packets sampled since the flow sampler was configured or the device was restarted. This is equivalent to the number of times a positive response was received when the sampler was queried to determine if the traffic needed to be sampled. See the explanation of the Requests field in this table. |
| Requests | Number of times the flow sampler was queried to determine if the traffic needed to be sampled. |
| Users | Interfaces on which the flow sampler is configured. |

show snmp stats

To display the SNMP statistics, use the **show snmp stats** command in privileged EXEC mode.

```
show snmp stats { hosts | oid }
```

Syntax Description

hosts Displays the details of the SNMP servers polled to the SNMP agent.

oid Displays recently requested object identifiers (OIDs).

Command Default

Displays the SNMP manager entries polled to the SNMP agent.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

Usage Guidelines

Use the **show snmp stats hosts** command to list the NMS IP address, the number of times an NMS polls the agent, and the timestamp of polling. To delete the entries polled to the SNMP agent, use the **clear snmp stats hosts** command.

Before running the **show snmp stats oid** command, connect the device to the NMS. The command output displays the list of OIDs recently requested by the NMS. It also displays the number of times an object identifier is requested by the NMS. This information is useful for troubleshooting memory leaks and network failures when little information is available about the MIBs that the NMS is querying. You can use the **show snmp stats oid** command at any time to view OIDs recently requested by the NMS.

The following is sample output of the **show snmp stats hosts** command.

```
Device# show snmp stats hosts
Request Count      Last Timestamp      Address
2                  00:00:01 ago       3.3.3.3
1                  1w2d ago           2.2.2.2
```

The table below describes the significant fields shown in the display:

Table 133: show snmp stats hosts Field Descriptions

| Field | Description |
|----------------|--|
| Request Count | Displays the number of times an SNMP Manager has sent requests to the SNMP Agent. |
| Last Timestamp | Displays the time at which the request was sent to the SNMP Agent by the SNMP Manager. |

| Field | Description |
|---------|--|
| Address | Displays the IP Address of the SNMP Manager that has sent the request. |

The following is sample output of the **show snmp stats oid** command.

Device# **show snmp stats oid**

```

time-stamp                #of times requested      OID
15:30:01 UTC Dec 2 2019   6                        ifPhysAddress
15:30:01 UTC Dec 2 2019  10                       system.2
15:30:01 UTC Dec 2 2019   9                        system.1
09:39:39 UTC Nov 26 2019  3                        system.5
09:39:39 UTC Nov 26 2019  3                        stem.4
09:39:39 UTC Nov 26 2019  3                        system.7
09:39:39 UTC Nov 26 2019  2                        system.6
09:39:39 UTC Nov 26 2019 10                       ceemEventMapEntry.2
09:39:39 UTC Nov 26 2019  6                        ipAddrEntry.4
09:39:39 UTC Nov 26 2019  3                        ipAddrEntry.5
09:39:39 UTC Nov 26 2019 10                       ipAddrEntry.3
09:39:39 UTC Nov 26 2019  7                        ipAddrEntry.2
09:39:39 UTC Nov 26 2019  4                        ipAddrEntry.1
09:39:39 UTC Nov 26 2019  1                        lsystem.3

```

The table below describes the significant fields shown in the display.

Table 134: show snmp stats oid Field Descriptions

| Field | Description |
|---------------------|---|
| time-stamp | Displays the time and date when the object identifiers is requested by the NMS. |
| #of times requested | Displays the number of times an object identifier is requested. |
| OID | Displays the object identifiers recently requested by the NMS. |

shutdown (monitor session)

To disable a configured ERSPAN session, use the **shutdown** command in ERSPAN monitor source session configuration mode. To enable configured ERSPAN session, use the **no** form of this command.

shutdown
no shutdown

Syntax Description

This command has no arguments or keywords.

Command Default

A newly configured ERSPAN session will be in the shutdown state.

Command Modes

ERSPAN monitor source session configuration mode (config-mon-erspan-src)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The ERSPAN session remains inactive until the **no shutdown** command is configured.

Examples

The following example shows how to activate an ERSPAN session using the **no shutdown** command:

```
Device> enable
Device# configure terminal
Device(config)# monitor session 1 type erspan-source
Device(config-mon-erspan-src)# description source1
Device(config-mon-erspan-src)# source interface GigabitEthernet1/0/1 rx
Device(config-mon-erspan-src)# destination
Device(config-mon-erspan-src-dst)# erspan-id 100
Device(config-mon-erspan-src-dst)# origin ip address 10.10.0.1
Device(config-mon-erspan-src-dst)# ip address 10.1.0.2
Device(config-mon-erspan-src-dst)# ip dscp 10
Device(config-mon-erspan-src-dst)# ip ttl 32
Device(config-mon-erspan-src-dst)# mtu 512
Device(config-mon-erspan-src-dst)# vrf monitoring
Device(config-mon-erspan-src-dst)# exit
Device(config-mon-erspan-src)# no shutdown
Device(config-mon-erspan-src)# end
```

Related Commands

| Command | Description |
|-----------------------------|--|
| monitor session type | Creates an ERSPAN source and destination session number or enters the ERSPAN session configuration mode for the session. |

snmp ifmib ifindex persist

To globally enable ifIndex values to persist, which will remain constant across reboots, for use by the Simple Network Management Protocol (SNMP), use the **snmp ifmib ifindex persist** command in global configuration mode. To globally disable ifIndex persistence, use the **no** form of this command.

snmp ifmib ifindex persist
no snmp ifmib ifindex persist

Syntax Description This command has no arguments or keywords.

Command Default The ifIndex persistence on a device is disabled.

Command Modes Global configuration (config)

Usage Guidelines The **snmp ifmib ifindex persist** command does not override an interface-specific configuration. The interface-specific configuration of ifIndex persistence is configured with the **snmp ifindex persist** and **snmp ifindex clear** commands in interface configuration mode.

The **snmp ifmib ifindex persist** command enables ifIndex persistence for all interfaces on a routing device by using the ifDescr and ifIndex entries in the ifIndex table of interface MIB (IF-MIB).

ifIndex persistence means that the ifIndex values in the IF-MIB persist across reboots, allowing for the consistent identification of specific interfaces that use SNMP.

If ifIndex persistence was previously disabled for a specific interface by using the **no snmp ifindex persist** command, ifIndex persistence will remain disabled for that interface.

Examples

The following example shows how to enable ifIndex persistence for all interfaces:

```
Device(config)# snmp ifmib ifindex persist
```

Related Commands

| Command | Description |
|-----------------------------|--|
| snmp ifindex clear | Clears any previously configured snmp ifIndex commands issued in interface configuration mode for a specific interface. |
| snmp ifindex persist | Enables ifIndex values that persist across reboots (ifIndex persistence) in the IF-MIB. |

snmp-server community

To configure the community access string to permit access to the Simple Network Management Protocol (SNMP), use the **snmp-server community** command in global configuration mode. To remove the specified community string, use the **no** form of this command.

```
snmp-server community [ clear | encrypted ] community-string [ view
view-name ] [ RO | RW ] [ SDROwner | SystemOwner ] [ access-list-name ]
no snmp-server community community-string
```

Syntax Description

| | |
|------------------------------|---|
| clear | (Optional) Specifies that the entered community-string is clear text and should be encrypted when displayed by the show running command. |
| encrypted | (Optional) Specifies that the entered <i>community-string</i> is encrypted text and should be displayed as such by the show running command. |
| <i>community-string</i> | Community string that acts like a password and permits access to the SNMP protocol. The maximum length of the <i>community-string</i> argument is 32 alphabetic characters. If the clear keyword was used, <i>community-string</i> is assumed to be clear text. If the encrypted keyword was used, <i>community-string</i> is assumed to be encrypted. If neither was used, <i>community-string</i> is assumed to be clear text. |
| view <i>view-name</i> | (Optional) Specifies the name of a previously defined view. The view defines the objects available to the community. |
| RO | (Optional) Specifies read-only access. Authorized management stations are able only to retrieve MIB objects. |
| RW | (Optional) Specifies read-write access. Authorized management stations are able both to retrieve and to modify MIB objects. |
| SDROwner | (Optional) Limits access to the owner service domain router (SDR). |
| SystemOwner | (Optional) Provides system-wide access including access to all non-owner SDRs. |
| <i>access-list-name</i> | (Optional) Name of an access list of IP addresses allowed to use the community string to gain access to the SNMP agent. |

Command Default

By default, an SNMP community string permits read-only access to all MIB objects. By default, a community string is assigned to the SDR owner.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|-----------------------------|
| Cisco IOS XE Everest 16.6.1 | The command was introduced. |

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes appropriate task IDs. If the user group assignment is preventing you from using a command, contact your AAA administrator for assistance.

Use the **snmp-server community** command to configure the community access string to permit access to SNMP.

To remove the specified community string, use the **no** form of this command.

Use the **clear** keyword to specify that the clear text community string you enter is displayed encrypted in the **show running** command output. To enter an encrypted string, use the **encrypted** keyword. To enter a clear text community string that is not encrypted by the system, use neither of these keywords.

When the **snmp-server community** command is entered with the **SDROwner** keyword, SNMP access is granted only to the MIB object instances in the owner SDR. When the **snmp-server community** command is entered with the **SystemOwner** keyword, SNMP access is granted to all SDRs in the system.

Note In a non-owner SDR, a community name provides access only to the object instances that belong to that SDR, regardless of the access privilege assigned to the community name. Access to the owner SDR and system-wide access privileges are available only from the owner SDR.

Examples

This example shows how to assign the string comaccess to SNMP, allowing read-only access, and to specify that IP access list 4 can use the community string:

```
RP/0/RP0/CPU0:router(config)# snmp-server community comaccess ro 4
```

The following example shows how to assign the string mgr to SNMP, allowing read-write access to the objects in the restricted view:

```
RP/0/RP0/CPU0:router(config)# snmp-server community mgr view restricted rw
```

This example shows how to remove the community comaccess:

```
RP/0/RP0/CPU0:router(config)# no snmp-server community comaccess
```

Related Commands

| Command | Description |
|------------------|--|
| snmp-server view | Creates or updates an SNMP view entry. |

snmp-server enable traps

To enable the device to send Simple Network Management Protocol (SNMP) notifications for various traps or inform requests to the network management system (NMS), use the **snmp-server enable traps** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps [ auth-framework [ sec-violation ] | bridge | call-home |
config | config-copy | config-ctid | copy-config | cpu | dot1x | energywise | entity
| envmon | errdisable | event-manager | flash | fru-ctrl | license | mac-notification
| port-security | power-ethernet | rep | snmp | stackwise | storm-control | stpx
| syslog | transceiver | tty | vlan-membership | vlancreate | vlandelete | vstack
| vtp ]
```

```
no snmp-server enable traps [ auth-framework [ sec-violation ] | bridge | call-home
| config | config-copy | config-ctid | copy-config | cpu | dot1x | energywise |
entity | envmon | errdisable | event-manager | flash | fru-ctrl | license |
mac-notification | port-security | power-ethernet | rep | snmp | stackwise |
storm-control | stpx | syslog | transceiver | tty | vlan-membership | vlancreate |
vlandelete | vstack | vtp ]
```

| Syntax Description | |
|-----------------------|--|
| auth-framework | (Optional) Enables SNMP CISCO-AUTH-FRAMEWORK-MIB traps. |
| sec-violation | (Optional) Enables SNMP camSecurityViolationNotif notifications. |
| bridge | (Optional) Enables SNMP STP Bridge MIB traps.* |
| call-home | (Optional) Enables SNMP CISCO-CALLHOME-MIB traps.* |
| config | (Optional) Enables SNMP configuration traps. |
| config-copy | (Optional) Enables SNMP configuration copy traps. |
| config-ctid | (Optional) Enables SNMP configuration CTID traps. |
| copy-config | (Optional) Enables SNMP copy-configuration traps. |
| cpu | (Optional) Enables CPU notification traps.* |
| dot1x | (Optional) Enables SNMP dot1x traps.* |
| energywise | (Optional) Enables SNMP energywise traps.* |
| entity | (Optional) Enables SNMP entity traps. |
| envmon | (Optional) Enables SNMP environmental monitor traps.* |
| errdisable | (Optional) Enables SNMP errdisable notification traps.* |
| event-manager | (Optional) Enables SNMP Embedded Event Manager traps. |
| flash | (Optional) Enables SNMP FLASH notification traps.* |

| | |
|-------------------------|--|
| fru-ctrl | (Optional) Generates entity field-replaceable unit (FRU) control traps. In a device stack, this trap refers to the insertion or removal of a device in the stack. |
| license | (Optional) Enables license traps.* Starting with Cisco IOS XE Dublin 17.11.1, this keyword is deprecated and no longer available on the CLI. For more information, see snmp-server enable traps license , on page 1343. |
| mac-notification | (Optional) Enables SNMP MAC Notification traps.* |
| port-security | (Optional) Enables SNMP port security traps.* |
| power-ethernet | (Optional) Enables SNMP power Ethernet traps.* |
| rep | (Optional) Enables SNMP Resilient Ethernet Protocol traps. |
| snmp | (Optional) Enables SNMP traps.* |
| stackwise | (Optional) Enables SNMP stackwise traps.* |
| storm-control | (Optional) Enables SNMP storm-control trap parameters.* |
| stpx | (Optional) Enables SNMP STPX MIB traps.* |
| syslog | (Optional) Enables SNMP syslog traps. |
| transceiver | (Optional) Enables SNMP transceiver traps.* |
| tty | (Optional) Sends TCP connection traps. This is enabled by default. |
| vlan-membership | (Optional) Enables SNMP VLAN membership traps. |
| vlancreate | (Optional) Enables SNMP VLAN-created traps. |
| vlandelete | (Optional) Enables SNMP VLAN-deleted traps. |
| vstack | (Optional) Enables SNMP Smart Install traps.* |
| vtp | (Optional) Enables VLAN Trunking Protocol (VTP) traps. |

Command Default The sending of SNMP traps is disabled.

Command Modes Global configuration

| Command History | Release | Modification |
|------------------------|-----------------------------|---|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Dublin 17.11.1 | The license keyword was deprecated. There is no replacement keyword. |

Usage Guidelines

The command options marked with an asterisk in the table above have subcommands. For more information on these subcommands, see the Related Commands section below.

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

When supported, use the **snmp-server enable traps** command to enable sending of traps or informs.

Note Though visible in the command-line help strings, the **fru-ctrl**, **insertion**, and **removal** keywords are not supported on the device. The **snmp-server enable informs** global configuration command is not supported. To enable the sending of SNMP inform notifications, use the **snmp-server enable traps** global configuration command combined with the **snmp-server host *host-addr* informs** global configuration command.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to enable more than one type of SNMP trap:

```
Device(config)# snmp-server enable traps config
Device(config)# snmp-server enable traps vtp
```

snmp-server enable traps bridge

To generate STP bridge MIB traps, use the **snmp-server enable traps bridge** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps bridge [newroot] [topologychange]
no snmp-server enable traps bridge [newroot] [topologychange]
```

Syntax Description

newroot (Optional) Enables SNMP STP bridge MIB new root traps.

topologychange (Optional) Enables SNMP STP bridge MIB topology change traps.

Command Default

The sending of bridge SNMP traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to send bridge new root traps to the NMS:

```
Device(config)# snmp-server enable traps bridge newroot
```

snmp-server enable traps bulkstat

To enable data-collection-MIB traps, use the **snmp-server enable traps bulkstat** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps bulkstat [collection | transfer]
no snmp-server enable traps bulkstat [collection | transfer]
```

Syntax Description

collection (Optional) Enables data-collection-MIB collection traps.

transfer (Optional) Enables data-collection-MIB transfer traps.

Command Default

The sending of data-collection-MIB traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate data-collection-MIB collection traps:

```
Device(config)# snmp-server enable traps bulkstat collection
```

snmp-server enable traps call-home

To enable SNMP CISCO-CALLHOME-MIB traps, use the **snmp-server enable traps call-home** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps call-home [message-send-fail | server-fail]
no snmp-server enable traps call-home [message-send-fail | server-fail]
```

Syntax Description

message-send-fail (Optional) Enables SNMP message-send-fail traps.

server-fail (Optional) Enables SNMP server-fail traps.

Command Default

The sending of SNMP CISCO-CALLHOME-MIB traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate SNMP message-send-fail traps:

```
Device(config)# snmp-server enable traps call-home message-send-fail
```

snmp-server enable traps cef

To enable SNMP Cisco Express Forwarding (CEF) traps, use the **snmp-server enable traps cef** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps cef [inconsistency | peer-fib-state-change | peer-state-change |
resource-failure]
no snmp-server enable traps cef [inconsistency | peer-fib-state-change | peer-state-change |
resource-failure]
```

Syntax Description

| | |
|------------------------------|--|
| inconsistency | (Optional) Enables SNMP CEF Inconsistency traps. |
| peer-fib-state-change | (Optional) Enables SNMP CEF Peer FIB State change traps. |
| peer-state-change | (Optional) Enables SNMP CEF Peer state change traps. |
| resource-failure | (Optional) Enables SNMP CEF Resource Failure traps. |

Command Default

The sending of SNMP CEF traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate SNMP CEF inconsistency traps:

```
Device(config)# snmp-server enable traps cef inconsistency
```

snmp-server enable traps cpu

To enable CPU notifications, use the **snmp-server enable traps cpu** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps cpu [threshold]
no snmp-server enable traps cpu [threshold]
```

| | |
|---------------------------|---|
| Syntax Description | threshold (Optional) Enables CPU threshold notification. |
|---------------------------|---|

| | |
|------------------------|---|
| Command Default | The sending of CPU notifications is disabled. |
|------------------------|---|

| | |
|----------------------|----------------------|
| Command Modes | Global configuration |
|----------------------|----------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | Specify the host (NMS) that receives the traps by using the snmp-server host global configuration command. If no trap types are specified, all trap types are sent. |
|-------------------------|--|

| | |
|-------------|--------------------------------------|
| Note | Informs are not supported in SNMPv1. |
|-------------|--------------------------------------|

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate CPU threshold notifications:

```
Device(config)# snmp-server enable traps cpu threshold
```

snmp-server enable traps envmon

To enable SNMP environmental traps, use the **snmp-server enable traps envmon** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps envmon [ fan ] [ shutdown ] [ status ] [ supply ] [ temperature ]
no snmp-server enable traps envmon [ fan ] [ shutdown ] [ status ] [ supply ] [ temperature ]
```

Syntax Description

| | |
|--------------------|--|
| fan | (Optional) Enables fan traps. |
| shutdown | (Optional) Enables environmental monitor shutdown traps. |
| status | (Optional) Enables SNMP environmental status-change traps. |
| supply | (Optional) Enables environmental monitor power-supply traps. |
| temperature | (Optional) Enables environmental monitor temperature traps. |

Command Default

The sending of environmental SNMP traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate fan traps:

```
Device(config)# snmp-server enable traps envmon fan
```

Examples

This example shows how to generate status-change traps:

```
Device(config)# snmp-server enable traps envmon status
```

snmp-server enable traps errdisable

To enable SNMP notifications of error-disabling, use the **snmp-server enable traps errdisable** command in global configuration mode. Use the **no** form of this command to return to the default setting.

snmp-server enable traps errdisable [**notification-rate** *number-of-notifications*]
no snmp-server enable traps errdisable [**notification-rate** *number-of-notifications*]

| | | |
|---------------------------|--|--|
| Syntax Description | notification-rate <i>number-of-notifications</i> | (Optional) Specifies number of notifications per minute as the notification rate. Accepted values are from 0 to 10000. |
| Command Default | The sending of SNMP notifications of error-disabling is disabled. | |
| Command Modes | Global configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Usage Guidelines | Specify the host (NMS) that receives the traps by using the snmp-server host global configuration command. If no trap types are specified, all trap types are sent. | |

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to set the number SNMP notifications of error-disabling to 2:

```
Device(config)# snmp-server enable traps errdisable notification-rate 2
```

snmp-server enable traps flash

To enable SNMP flash notifications, use the **snmp-server enable traps flash** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps flash [insertion] [removal]
no snmp-server enable traps flash [insertion] [removal]
```

Syntax Description

insertion (Optional) Enables SNMP flash insertion notifications.

removal (Optional) Enables SNMP flash removal notifications.

Command Default

The sending of SNMP flash notifications is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate SNMP flash insertion notifications:

```
Device(config)# snmp-server enable traps flash insertion
```

snmp-server enable traps isis

To enable intermediate system-to-intermediate system (IS-IS) link-state routing protocol traps, use the **snmp-server enable traps isis** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps isis [errors | state-change]
no snmp-server enable traps isis [errors | state-change]
```

| | | |
|---------------------------|--|------------------------------|
| Syntax Description | errors (Optional) Enables IS-IS error traps. | |
| | state-change (Optional) Enables IS-IS state change traps. | |
| Command Default | The sending of IS-IS traps is disabled. | |
| Command Modes | Global configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate IS-IS error traps:

```
Device(config)# snmp-server enable traps isis errors
```

snmp-server enable traps license

To enable license traps, use the **snmp-server enable traps license** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps license [deploy] [error] [usage]
no snmp-server enable traps license [deploy] [error] [usage]
```

Syntax Description

deploy (Optional) Enables license deployment traps.

error (Optional) Enables license error traps.

usage (Optional) Enables license usage traps.

Command Default

The sending of license traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Dublin 17.11.1 | This command was deprecated. There is no replacement command. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Starting from Cisco IOS XE Dublin 17.11.1, the **snmp-server enable traps license** global configuration command and the associated MIB, CISCO-LICENSE-MGMT-MIB, are not supported. In place of the deprecated command and unsupported MIB, use CISCO-SMART-LIC-MIB.

On devices where In-Service Software Upgrade (ISSU) is supported, before you perform an ISSU upgrade, you must manually remove the command if it is present in the startup configuration. If the command is present in the configuration during an ISSU upgrade, it causes an ISSU configuration synchronization failure. Enter the **no** form of the command to remove it from the configuration and save changes by entering the **copy running-config startup-config** command in privileged EXEC mode.

Examples

This example shows how to generate license deployment traps:

```
Device(config)# snmp-server enable traps license deploy
```

snmp-server enable traps mac-notification

To enable SNMP MAC notification traps, use the **snmp-server enable traps mac-notification** command in global configuration mode. Use the **no** form of this command to return to the default setting.

snmp-server enable traps mac-notification [**change**] [**move**] [**threshold**]
no snmp-server enable traps mac-notification [**change**] [**move**] [**threshold**]

Syntax Description

change (Optional) Enables SNMP MAC change traps.

move (Optional) Enables SNMP MAC move traps.

threshold (Optional) Enables SNMP MAC threshold traps.

Command Default

The sending of SNMP MAC notification traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate SNMP MAC notification change traps:

```
Device(config)# snmp-server enable traps mac-notification change
```

snmp-server enable traps ospf

To enable SNMP Open Shortest Path First (OSPF) traps, use the **snmp-server enable traps ospf** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps ospf [cisco-specific | errors | lsa | rate-limit rate-limit-time
max-number-of-traps | retransmit | state-change]
no snmp-server enable traps ospf [cisco-specific | errors | lsa | rate-limit rate-limit-time
max-number-of-traps | retransmit | state-change]
```

| Syntax Description | | |
|----------------------------|------------|--|
| cisco-specific | (Optional) | Enables Cisco-specific traps. |
| errors | (Optional) | Enables error traps. |
| lsa | (Optional) | Enables link-state advertisement (LSA) traps. |
| rate-limit | (Optional) | Enables rate-limit traps. |
| <i>rate-limit-time</i> | (Optional) | Specifies window of time in seconds for rate-limit traps. Accepted values are 2 to 60. |
| <i>max-number-of-traps</i> | (Optional) | Specifies maximum number of rate-limit traps to be sent in window time. |
| retransmit | (Optional) | Enables packet-retransmit traps. |
| state-change | (Optional) | Enables state-change traps. |

Command Default The sending of OSPF SNMP traps is disabled.

Command Modes Global configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to enable LSA traps:

```
Device(config)# snmp-server enable traps ospf lsa
```

snmp-server enable traps pim

To enable SNMP Protocol-Independent Multicast (PIM) traps, use the **snmp-server enable traps pim** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps pim [invalid-pim-message] [neighbor-change] [rp-mapping-change]
no snmp-server enable traps pim [invalid-pim-message] [neighbor-change] [rp-mapping-change]
```

Syntax Description

invalid-pim-message (Optional) Enables invalid PIM message traps.

neighbor-change (Optional) Enables PIM neighbor-change traps.

rp-mapping-change (Optional) Enables rendezvous point (RP)-mapping change traps.

Command Default

The sending of PIM SNMP traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to enable invalid PIM message traps:

```
Device(config)# snmp-server enable traps pim invalid-pim-message
```

snmp-server enable traps port-security

To enable SNMP port security traps, use the **snmp-server enable traps port-security** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps port-security [trap-rate value]
no snmp-server enable traps port-security [trap-rate value]
```

| | | |
|---------------------------|--|--|
| Syntax Description | trap-rate <i>value</i> | (Optional) Sets the maximum number of port-security traps sent per second. The range is from 0 to 1000; the default is 0 (no limit imposed; a trap is sent at every occurrence). |
| Command Default | The sending of port security SNMP traps is disabled. | |
| Command Modes | Global configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Usage Guidelines | Specify the host (NMS) that receives the traps by using the snmp-server host global configuration command. If no trap types are specified, all trap types are sent. | |

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to enable port-security traps at a rate of 200 per second:

```
Device(config)# snmp-server enable traps port-security trap-rate 200
```

snmp-server enable traps power-ethernet

To enable SNMP power-over-Ethernet (PoE) traps, use the **snmp-server enable traps power-ethernet** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps power-ethernet {group number | police}
no snmp-server enable traps power-ethernet {group number | police}
```

| | | |
|---------------------------|--|---|
| Syntax Description | group <i>number</i> | Enables inline power group-based traps for the specified group number. Accepted values are from 1 to 9. |
| | police | Enables inline power policing traps. |
| Command Default | The sending of power-over-Ethernet SNMP traps is disabled. | |
| Command Modes | Global configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to enable power-over-Ethernet traps for group 1:

```
Device(config)# snmp-server enable traps power-over-ethernet group 1
```

snmp-server enable traps snmp

To enable SNMP traps, use the **snmp-server enable traps snmp** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps snmp [authentication] [coldstart] [linkdown] [linkup] [warmstart]
no snmp-server enable traps snmp [authentication] [coldstart] [linkdown] [linkup]
] [warmstart]
```

| Syntax Description | |
|-----------------------|--|
| authentication | (Optional) Enables authentication traps. |
| coldstart | (Optional) Enables cold start traps. |
| linkdown | (Optional) Enables linkdown traps. |
| linkup | (Optional) Enables linkup traps. |
| warmstart | (Optional) Enables warmstart traps. |

Command Default The sending of SNMP traps is disabled.

Command Modes Global configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to enable a warmstart SNMP trap:

```
Device(config)# snmp-server enable traps snmp warmstart
```

snmp-server enable traps storm-control

To enable SNMP storm-control trap parameters, use the **snmp-server enable traps storm-control** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps storm-control { trap-rate number-of-minutes }
no snmp-server enable traps storm-control { trap-rate }
```

| | |
|---------------------------|---|
| Syntax Description | <p>trap-rate <i>number-of-minutes</i> (Optional) Specifies the SNMP storm-control trap rate in minutes. Accepted values are from 0 to 1000. The default is 0.</p> <p>Value 0 indicates that no limit is imposed and a trap is sent at every occurrence. When configured, show run all command output displays <code>no snmp-server enable traps storm-control</code>.</p> |
|---------------------------|---|

| | |
|------------------------|--|
| Command Default | The sending of SNMP storm-control trap parameters is disabled. |
|------------------------|--|

| | |
|----------------------|----------------------|
| Command Modes | Global configuration |
|----------------------|----------------------|

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | Specify the host (NMS) that receives the traps by using the snmp-server host global configuration command. If no trap types are specified, all trap types are sent. |
|-------------------------|--|

| | |
|-------------|--------------------------------------|
| Note | Informs are not supported in SNMPv1. |
|-------------|--------------------------------------|

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to set the SNMP storm-control trap rate to 10 traps per minute:

```
Device(config)# snmp-server enable traps storm-control trap-rate 10
```

snmp-server enable traps stpx

To enable SNMP STPX MIB traps, use the **snmp-server enable traps stpx** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps stpx [inconsistency] [loop-inconsistency] [root-inconsistency]
no snmp-server enable traps stpx [inconsistency] [loop-inconsistency] [root-inconsistency]
```

Syntax Description

inconsistency (Optional) Enables SNMP STPX MIB inconsistency update traps.

loop-inconsistency (Optional) Enables SNMP STPX MIB loop inconsistency update traps.

root-inconsistency (Optional) Enables SNMP STPX MIB root inconsistency update traps.

Command Default

The sending of SNMP STPX MIB traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate SNMP STPX MIB inconsistency update traps:

```
Device(config)# snmp-server enable traps stpx inconsistency
```

snmp-server enable traps transceiver

To enable SNMP transceiver traps, use the **snmp-server enable traps transceiver** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps transceiver {all}
no snmp-server enable traps transceiver {all}
```

Syntax Description **a** (Optional) Enables all SNMP transceiver traps.

Command Default The sending of SNMP transceiver traps is disabled.

Command Modes Global configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to set all SNMP transceiver traps:

```
Device(config)# snmp-server enable traps transceiver all
```

snmp-server enable traps vrfmib

To allow SNMP vrfmib traps, use the **snmp-server enable traps vrfmib** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps vrfmib [vnet-trunk-down | vnet-trunk-up | vrf-down | vrf-up]
no snmp-server enable traps vrfmib [vnet-trunk-down | vnet-trunk-up | vrf-down | vrf-up]
```

Syntax Description

vnet-trunk-down (Optional) Enables vrfmib trunk down traps.

vnet-trunk-up (Optional) Enables vrfmib trunk up traps.

vrf-down (Optional) Enables vrfmib vrf down traps.

vrf-up (Optional) Enables vrfmib vrf up traps.

Command Default

The sending of SNMP vrfmib traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate vrfmib trunk down traps:

```
Device(config)# snmp-server enable traps vrfmib vnet-trunk-down
```

snmp-server enable traps vstack

To enable SNMP smart install traps, use the **snmp-server enable traps vstack** command in global configuration mode. Use the **no** form of this command to return to the default setting.

```
snmp-server enable traps vstack [addition] [failure] [lost] [operation]
no snmp-server enable traps vstack [addition] [failure] [lost] [operation]
```

Syntax Description

| | |
|------------------|--|
| addition | (Optional) Enables client added traps. |
| failure | (Optional) Enables file upload and download failure traps. |
| lost | (Optional) Enables client lost trap. |
| operation | (Optional) Enables operation mode change traps. |

Command Default

The sending of SNMP smart install traps is disabled.

Command Modes

Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Specify the host (NMS) that receives the traps by using the **snmp-server host** global configuration command. If no trap types are specified, all trap types are sent.

Note Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate **snmp-server enable traps** command for each trap type.

Examples

This example shows how to generate SNMP Smart Install client-added traps:

```
Device(config)# snmp-server enable traps vstack addition
```

snmp-server engineID

To configure a name for either the local or remote copy of SNMP, use the **snmp-server engineID** command in global configuration mode.

```
snmp-server engineID {local engineid-string | remote ip-address [udp-port port-number] engineid-string}
```

| Syntax Description | Parameter | Description |
|--------------------|-------------------------------------|--|
| | local <i>engineid-string</i> | Specifies a 24-character ID string with the name of the copy of SNMP. You need not specify the entire 24-character engine ID if it has trailing zeros. Specify only the portion of the engine ID up to the point where only zeros remain in the value. |
| | remote <i>ip-address</i> | Specifies the remote SNMP copy. Specify the <i>ip-address</i> of the device that contains the remote copy of SNMP. |
| | udp-port <i>port-number</i> | (Optional) Specifies the User Datagram Protocol (UDP) port on the remote device. The default is 162. |

Command Modes Global configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines None

Examples

The following example configures a local engine ID of 123400000000000000000000:

```
Device(config)# snmp-server engineID local 1234
```

snmp-server group

To configure a new Simple Network Management Protocol (SNMP) group, use the **snmp-server group** command in global configuration mode. To remove a specified SNMP group, use the **no** form of this command.

```
snmp-server group group-name {v1 | v2c | v3 {auth | noauth | priv}} [context context-name] [match
{exact | prefix}] [read read-view] [write write-view] [notify notify-view] [access [ipv6
named-access-list] [{acl-numberacl-name}]]
```

```
no snmp-server group group-name {v1 | v2c | v3 {auth | noauth | priv}} [context context-name]
```

Syntax Description

| | |
|---------------------|---|
| <i>group-name</i> | Name of the group. |
| v1 | Specifies that the group is using the SNMPv1 security model. SNMPv1 is the least secure of the possible SNMP security models. |
| v2c | Specifies that the group is using the SNMPv2c security model. The SNMPv2c security model allows informs to be transmitted and supports 64-character strings. |
| v3 | Specifies that the group is using the SNMPv3 security model. SNMPv3 is the most secure of the supported security models. It allows you to explicitly configure authentication characteristics. |
| auth | Specifies authentication of a packet without encrypting it. |
| noauth | Specifies no authentication of a packet. |
| priv | Specifies authentication of a packet with encryption. |
| context | (Optional) Specifies the SNMP context to associate with this SNMP group and its views. |
| <i>context-name</i> | (Optional) Context name. |
| match | (Optional) Specifies an exact context match or matches only the context prefix. |
| <i>exact</i> | (Optional) Matches the exact context. |
| <i>prefix</i> | (Optional) Matches only the context prefix. |
| read | (Optional) Specifies a read view for the SNMP group. This view enables you to view only the contents of the agent. |
| <i>read-view</i> | (Optional) String of a maximum of 64 characters that is the name of the view. The default is that the read-view is assumed to be every object belonging to the Internet object identifier (OID) space (1.3.6.1), unless the read option is used to override this state. |
| write | (Optional) Specifies a write view for the SNMP group. This view enables you to enter data and configure the contents of the agent. |

| | |
|--------------------------|--|
| <i>write-view</i> | (Optional) String of a maximum of 64 characters that is the name of the view. The default is that nothing is defined for the write view (that is, the null OID). You must configure write access. |
| notify | (Optional) Specifies a notify view for the SNMP group. This view enables you to specify a notify, inform, or trap. |
| <i>notify-view</i> | (Optional) String of a maximum of 64 characters that is the name of the view. By default, nothing is defined for the notify view (that is, the null OID) until the snmp-server host command is configured. If a view is specified in the snmp-server group command, any notifications in that view that are generated will be sent to all users associated with the group (provided a SNMP server host configuration exists for the user). Cisco recommends that you let the software autogenerate the notify view. See the “Configuring Notify Views” section in this document. |
| access | (Optional) Specifies a standard access control list (ACL) to associate with the group. |
| ipv6 | (Optional) Specifies an IPv6 named access list. If both IPv6 and IPv4 access lists are indicated, the IPv6 named access list must appear first in the list. |
| <i>named-access-list</i> | (Optional) Name of the IPv6 access list. |
| <i>acl-number</i> | (Optional) The <i>acl-number</i> argument is an integer from 1 to 99 that identifies a previously configured standard access list. |
| <i>acl-name</i> | (Optional) The <i>acl-name</i> argument is a string of a maximum of 64 characters that is the name of a previously configured standard access list. |

Command Default

No SNMP server groups are configured.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|------------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

Usage Guidelines

When a community string is configured internally, two groups with the name public are autogenerated, one for the v1 security model and the other for the v2c security model. Similarly, deleting a community string will delete a v1 group with the name public and a v2c group with the name public.

No default values exist for authentication or privacy algorithms when you configure the **snmp-server group** command. Also, no default passwords exist. For information about specifying a Message Digest 5 (MD5) password, see the documentation of the **snmp-server user** command.

Configuring Notify Views

The notify-view option is available for two reasons:

- If a group has a notify view that is set using SNMP, you may need to change the notify view.

- The **snmp-server host** command may have been configured before the **snmp-server group** command. In this case, you must either reconfigure the **snmp-server host** command, or specify the appropriate notify view.

Specifying a notify view when configuring an SNMP group is not recommended, for the following reasons:

- The **snmp-server host** command autogenerates a notify view for the user, and then adds it to the group associated with that user.
- Modifying the group's notify view will affect all users associated with that group.

Instead of specifying the notify view for a group as part of the **snmp-server group** command, use the following commands in the order specified:

1. **snmp-server user**—Configures an SNMP user.
2. **snmp-server group**—Configures an SNMP group, without adding a notify view .
3. **snmp-server host**—Autogenerates the notify view by specifying the recipient of a trap operation.

SNMP Contexts

SNMP contexts provide VPN users with a secure way of accessing MIB data. When a VPN is associated with a context, that VPN's specific MIB data exists in that context. Associating a VPN with a context enables service providers to manage networks with multiple VPNs. Creating and associating a context with a VPN enables a provider to prevent the users of one VPN from accessing information about users of other VPNs on the same networking device.

Use this command with the **context** *context-name* keyword and argument to associate a read, write, or notify SNMP view with an SNMP context.

Create an SNMP Group

The following example shows how to create the SNMP server group “public,” allowing read-only access for all objects to members of the standard named access list “lmnop”:

```
Device(config)# snmp-server group public v2c access lmnop
```

Remove an SNMP Server Group

The following example shows how to remove the SNMP server group “public” from the configuration:

```
Device(config)# no snmp-server group public v2c
```

Associate an SNMP Server Group with Specified Views

The following example shows SNMP context “A” associated with the views in SNMPv2c group “GROUP1”:

```
Device(config)# snmp-server context A
Device(config)# snmp mib community commA
```

```
Device(config)# snmp mib community-map commA context A target-list commAVpn  
Device(config)# snmp-server group GROUP1 v2c context A read viewA write viewA notify viewB
```

| Related Commands | Command | Description |
|------------------|-------------------------------|---|
| | show snmp group | Displays the names of groups on the device and the security model, the status of the different views, and the storage type of each group. |
| | snmp mib community-map | Associates a SNMP community with an SNMP context, engine ID, security name, or VPN target list. |
| | snmp-server host | Specifies the recipient of a SNMP notification operation. |
| | snmp-server user | Configures a new user to a SNMP group. |

snmp-server host

To specify the recipient (host) of a Simple Network Management Protocol (SNMP) notification operation, use the **snmp-server host** global configuration command on the device. Use the **no** form of this command to remove the specified host.

```
snmp-server host {host-addr} [vrf vrf-instance] [informs | traps] [version {1 | 2c | 3
{auth | noauth | priv} } ] {community-string [notification-type] }
no snmp-server host {host-addr} [vrf vrf-instance] [informs | traps] [version {1 | 2c |
3 {auth | noauth | priv} } ] {community-string [notification-type] }
```

Syntax Description

| | |
|--|--|
| <i>host-addr</i> | Name or Internet address of the host (the targeted recipient). |
| vrf <i>vrf-instance</i> | (Optional) Specifies the virtual private network (VPN) routing instance and name for this host. |
| informs traps | (Optional) Sends SNMP traps or informs to this host. |
| version 1 2c 3 | (Optional) Specifies the version of the SNMP used to send the traps. 1 —SNMPv1. This option is not available with informs. 2c —SNMPv2C. 3 —SNMPv3. One of the authorization keywords (see next table row) must follow the Version 3 keyword. |
| auth noauth priv | auth (Optional)—Enables Message Digest 5 (MD5) and Secure Hash Algorithm (SHA) packet authentication. noauth (Default)—The noAuthNoPriv security level. This is the default if the auth noauth priv keyword choice is not specified. priv (Optional)—Enables Data Encryption Standard (DES) packet encryption (also called privacy). |
| <i>community-string</i> | Password-like community string sent with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community global configuration command before using the snmp-server host command. |
| Note | The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command. |

notification-type (Optional) Type of notification to be sent to the host. If no type is specified, all notifications are sent. The notification type can be one or more of the these keywords:

- **auth-framework**—Sends SNMP CISCO-AUTH-FRAMEWORK-MIB traps.
 - **bridge**—Sends SNMP Spanning Tree Protocol (STP) bridge MIB traps.
 - **bulkstat**—Sends Data-Collection-MIB Collection notification traps.
 - **call-home**—Sends SNMP CISCO-CALLHOME-MIB traps.
 - **cef**—Sends SNMP CEF traps.
 - **config**—Sends SNMP configuration traps.
 - **config-copy**—Sends SNMP config-copy traps.
 - **config-ctid**—Sends SNMP config-ctid traps.
 - **copy-config**—Sends SNMP copy configuration traps.
 - **cpu**—Sends CPU notification traps.
 - **cpu threshold**—Sends CPU threshold notification traps.
 - **entity**—Sends SNMP entity traps.
-

-
- **envmon**—Sends environmental monitor traps.
 - **errdisable**—Sends SNMP errdisable notification traps.
 - **event-manager**—Sends SNMP Embedded Event Manager traps.
 - **flash**—Sends SNMP FLASH notifications.
 - **flowmon**—Sends SNMP flowmon notification traps.
 - **ipmulticast**—Sends SNMP IP multicast routing traps.
 - **ipsla**—Sends SNMP IP SLA traps.
 - **license**—Sends license traps.
 - **local-auth**—Sends SNMP local auth traps.
 - **mac-notification**—Sends SNMP MAC notification traps.
 - **pim**—Sends SNMP Protocol-Independent Multicast (PIM) traps.
 - **power-ethernet**—Sends SNMP power Ethernet traps.
 - **snmp**—Sends SNMP-type traps.
 - **storm-control**—Sends SNMP storm-control traps.
 - **stp**—Sends SNMP STP extended MIB traps.
 - **syslog**—Sends SNMP syslog traps.
 - **transceiver**—Sends SNMP transceiver traps.
 - **tty**—Sends TCP connection traps.
 - **vlan-membership**—Sends SNMP VLAN membership traps.
 - **vlancreate**—Sends SNMP VLAN-created traps.
 - **vlandelete**—Sends SNMP VLAN-deleted traps.
 - **vrfmib**—Sends SNMP vrfmib traps.
 - **vtp**—Sends SNMP VLAN Trunking Protocol (VTP) traps.
 - **wireless**—Sends wireless traps.
-

Command Default

This command is disabled by default. No notifications are sent.

If you enter this command with no keywords, the default is to send all trap types to the host. No informs are sent to this host.

If no **version** keyword is present, the default is Version 1.

If Version 3 is selected and no authentication keyword is entered, the default is the **noauth** (noAuthNoPriv) security level.

Note Though visible in the command-line help strings, the **fru-ctrl** keyword is not supported.

Command Modes Global configuration

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

SNMP notifications can be sent as traps or inform requests. Traps are unreliable because the receiver does not send acknowledgments when it receives traps. The sender cannot determine if the traps were received. However, an SNMP entity that receives an inform request acknowledges the message with an SNMP response PDU. If the sender never receives the response, the inform request can be sent again, so that informs are more likely to reach their intended destinations.

However, informs consume more resources in the agent and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Traps are also sent only once, but an inform might be retried several times. The retries increase traffic and contribute to a higher overhead on the network.

If you do not enter an **snmp-server host** command, no notifications are sent. To configure the device to send SNMP notifications, you must enter at least one **snmp-server host** command. If you enter the command with no keywords, all trap types are enabled for the host. To enable multiple hosts, you must enter a separate **snmp-server host** command for each host. You can specify multiple notification types in the command for each host.

If a local user is not associated with a remote host, the device does not send informs for the **auth** (authNoPriv) and the **priv** (authPriv) authentication levels.

When multiple **snmp-server host** commands are given for the same host and kind of notification (trap or inform), each succeeding command overwrites the previous command. Only the last **snmp-server host** command is in effect. For example, if you enter an **snmp-server host inform** command for a host and then enter another **snmp-server host inform** command for the same host, the second command replaces the first.

The **snmp-server host** command is used with the **snmp-server enable traps** global configuration command. Use the **snmp-server enable traps** command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one **snmp-server enable traps** command and the **snmp-server host** command for that host must be enabled. Some notification types cannot be controlled with the **snmp-server enable traps** command. For example, some notification types are always enabled. Other notification types are enabled by a different command.

The **no snmp-server host** command with no keywords disables traps, but not informs, to the host. To disable informs, use the **no snmp-server host informs** command.

Examples

This example shows how to configure a unique SNMP community string named comaccess for traps and prevent SNMP polling access with this string through access-list 10:

```
Device(config)# snmp-server community comaccess ro 10
Device(config)# snmp-server host 172.20.2.160 comaccess
Device(config)# access-list 10 deny any
```

This example shows how to send the SNMP traps to the host specified by the name myhost.cisco.com. The community string is defined as comaccess:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host myhost.cisco.com comaccess snmp
```

This example shows how to enable the device to send all traps to the host myhost.cisco.com by using the community string public:

```
Device(config)# snmp-server enable traps
Device(config)# snmp-server host myhost.cisco.com public
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

snmp-server manager

To start the Simple Network Management Protocol (SNMP) manager process, use the **snmp-server manager** command in global configuration mode. To stop the SNMP manager process, use the **no** form of this command.

snmp-server manager
no snmp-server manager

Command Default

Command Modes Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|-----------------------------|
| Cisco IOS XE Everest 16.6.1 | The command was introduced. |

Usage Guidelines

The SNMP manager process sends SNMP requests to agents and receives SNMP responses and notifications from agents. When the SNMP manager process is enabled, the router can query other SNMP agents and process incoming SNMP traps.

Most network security policies assume that routers will be accepting SNMP requests, sending SNMP responses, and sending SNMP notifications. With the SNMP manager functionality enabled, the router may also be sending SNMP requests, receiving SNMP responses, and receiving SNMP notifications. The security policy implementation may need to be updated prior to enabling this functionality.

SNMP requests are typically sent to UDP port 161. SNMP responses are typically sent from UDP port 161. SNMP notifications are typically sent to UDP port 162.

The following example shows how to enable the SNMP manager process:

```
Router(config)# snmp-server manager
```

Related Commands

| Command | Description |
|-----------------------------|--|
| show running-config | Displays the contents of the currently running configuration file or the configuration for a specific interface, or map class information. |
| show snmp user | Displays information on each SNMP username in the group username table. |
| snmp-server engineID | Displays the identification of the local SNMP engine and all remote engines that have been configured on the device. |

snmp-server user

To configure a new user to a Simple Network Management Protocol (SNMP) group, use the **snmp-server user** command in global configuration mode. To remove a user from an SNMP group, use the **no** form of this command.

```
snmp-server user username group-name [remote host [udp-port port] [vrf vrf-name]] {v1 | v2c | v3 [encrypted] [auth {md5 | sha} auth-password]} [access [ipv6 nacl] [priv {des | 3des | aes {128 | 192 | 256}}] privpassword] {acl-numberacl-name}
```

```
no snmp-server user username group-name [remote host [udp-port port] [vrf vrf-name]] {v1 | v2c | v3 [encrypted] [auth {md5 | sha} auth-password]} [access [ipv6 nacl] [priv {des | 3des | aes {128 | 192 | 256}}] privpassword] {acl-numberacl-name}
```

Syntax Description

| | |
|----------------------|---|
| <i>username</i> | Name of the user on the host that connects to the agent. |
| <i>group-name</i> | Name of the group to which the user belongs. |
| remote | (Optional) Specifies a remote SNMP entity to which the user belongs, and the hostname or IPv6 address or IPv4 IP address of that entity. If both an IPv6 address and IPv4 IP address are being specified, the IPv6 host must be listed first. |
| <i>host</i> | (Optional) Name or IP address of the remote SNMP host. |
| udp-port | (Optional) Specifies the User Datagram Protocol (UDP) port number of the remote host. |
| <i>port</i> | (Optional) Integer value that identifies the UDP port. The default is 162. |
| vrf | (Optional) Specifies an instance of a routing table. |
| <i>vrf-name</i> | (Optional) Name of the Virtual Private Network (VPN) routing and forwarding (VRF) table to use for storing data. |
| v1 | Specifies that SNMPv1 should be used. |
| v2c | Specifies that SNMPv2c should be used. |
| v3 | Specifies that the SNMPv3 security model should be used. Allows the use of the encrypted keyword or auth keyword or both. |
| encrypted | (Optional) Specifies whether the password appears in encrypted format. |
| auth | (Optional) Specifies which authentication level should be used. |
| md5 | (Optional) Specifies the HMAC-MD5-96 authentication level. |
| sha | (Optional) Specifies the HMAC-SHA-96 authentication level. |
| <i>auth-password</i> | (Optional) String (not to exceed 64 characters) that enables the agent to receive packets from the host. |
| access | (Optional) Specifies an Access Control List (ACL) to be associated with this SNMP user. |
| ipv6 | (Optional) Specifies an IPv6 named access list to be associated with this SNMP user. |

| | |
|---------------------|--|
| <i>nacl</i> | (Optional) Name of the ACL. IPv4, IPv6, or both IPv4 and IPv6 access lists may be specified. If both are specified, the IPv6 named access list must appear first in the statement. |
| priv | (Optional) Specifies the use of the User-based Security Model (USM) for SNMP version 3 for SNMP message level security. |
| des | (Optional) Specifies the use of the 56-bit Digital Encryption Standard (DES) algorithm for encryption. |
| 3des | (Optional) Specifies the use of the 168-bit 3DES algorithm for encryption. |
| aes | (Optional) Specifies the use of the Advanced Encryption Standard (AES) algorithm for encryption. |
| 128 | (Optional) Specifies the use of a 128-bit AES algorithm for encryption. |
| 192 | (Optional) Specifies the use of a 192-bit AES algorithm for encryption. |
| 256 | (Optional) Specifies the use of a 256-bit AES algorithm for encryption. |
| <i>privpassword</i> | (Optional) String (not to exceed 64 characters) that specifies the privacy user password. |
| <i>acl-number</i> | (Optional) Integer in the range from 1 to 99 that specifies a standard access list of IP addresses. |
| <i>acl-name</i> | (Optional) String (not to exceed 64 characters) that is the name of a standard access list of IP addresses. |

Command Default

See the table in the “Usage Guidelines” section for default behaviors for encryption, passwords, and access lists.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

Usage Guidelines

To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides. Also, before you configure remote users for a particular agent, configure the SNMP engine ID, using the **snmp-server engineID** command with the **remote** keyword. The remote agent’s SNMP engine ID is needed when computing the authentication and privacy digests from the password. If the remote engine ID is not configured first, the configuration command will fail.

For the *privpassword* and *auth-password* arguments, the minimum length is one character; the recommended length is at least eight characters, and should include both letters and numbers. The recommended maximum length is 64 characters.

The table below describes the default user characteristics for encryption, passwords, and access lists.

Table 135: snmp-server user Default Descriptions

| Characteristic | Default |
|----------------|---|
| Access lists | Access from all IP access lists is permitted. |
| Encryption | Not present by default. The encrypted keyword is used to specify that the passwords are message digest algorithm 5 (MD5) digests and not text passwords. |
| Passwords | Assumed to be text strings. |
| Remote users | All users are assumed to be local to this SNMP engine unless you specify they are remote with the remote keyword. |

SNMP passwords are localized using the SNMP engine ID of the authoritative SNMP engine. For informs, the authoritative SNMP agent is the remote agent. You need to configure the remote agent's SNMP engine ID in the SNMP database before you can send proxy requests or informs to it.

Note Changing the engine ID after configuring the SNMP user, does not allow to remove the user. To remove the user, you need to first reconfigure the SNMP user.

Working with Passwords and Digests

No default values exist for authentication or privacy algorithms when you configure the command. Also, no default passwords exist. The minimum length for a password is one character, although Cisco recommends using at least eight characters for security. The recommended maximum length of a password is 64 characters. If you forget a password, you cannot recover it and will need to reconfigure the user. You can specify either a plain-text password or a localized MD5 digest.

If you have the localized MD5 or Secure Hash Algorithm (SHA) digest, you can specify that string instead of the plain-text password. The digest should be formatted as aa:bb:cc:dd where aa, bb, and cc are hexadecimal values. Also, the digest should be exactly 16 octets long.

Examples

The following example shows how to add the user abcd to the SNMP server group named public. In this example, no access list is specified for the user, so the standard named access list applied to the group applies to the user.

```
Device(config)# snmp-server user abcd public v2c
```

The following example shows how to add the user abcd to the SNMP server group named public. In this example, access rules from the standard named access list qrst apply to the user.

```
Device(config)# snmp-server user abcd public v2c access qrst
```

In the following example, the plain-text password cisco123 is configured for the user abcd in the SNMP server group named public:

```
Device(config)# snmp-server user abcd public v3 auth md5 cisco123
```

When you enter a **show running-config** command, a line for this user will be displayed. To learn if this user has been added to the configuration, use the `show snmp user` command.

Note The **show running-config** command does not display any of the active SNMP users created in `authPriv` or `authNoPriv` mode, though it does display the users created in `noAuthNoPriv` mode. To display any active SNMPv3 users created in `authPriv`, `authNoPriv`, or `noAuthNoPriv` mode, use the **show snmp user** command.

If you have the localized MD5 or SHA digest, you can specify that string instead of the plain-text password. The digest should be formatted as `aa:bb:cc:dd` where `aa`, `bb`, and `cc` are hexadecimal values. Also, the digest should be exactly 16 octets long.

In the following example, the MD5 digest string is used instead of the plain-text password:

```
Device(config)# snmp-server user abcd public v3 encrypted auth md5
00:11:22:33:44:55:66:77:88:99:AA:BB:CC:DD:EE:FF
```

In the following example, the user `abcd` is removed from the SNMP server group named `public`:

```
Device(config)# no snmp-server user abcd public v2c
```

In the following example, the user `abcd` from the SNMP server group named `public` specifies the use of the 168-bit 3DES algorithm for privacy encryption with `secure3des` as the password.

```
Device(config)# snmp-server user abcd public priv v2c 3des secure3des
```

Related Commands

| Command | Description |
|-----------------------------|--|
| show running-config | Displays the contents of the currently running configuration file or the configuration for a specific interface, or map class information. |
| show snmp user | Displays information on each SNMP username in the group username table. |
| snmp-server engineID | Displays the identification of the local SNMP engine and all remote engines that have been configured on the device. |

snmp-server view

To create or update a view entry, use the **snmp-server view** command in global configuration mode. To remove the specified Simple Network Management Protocol (SNMP) server view entry, use the **no** form of this command.

snmp-server view *view-name oid-tree* {**included** | **excluded**}
no snmp-server view *view-name*

Syntax Description

| | |
|------------------|--|
| <i>view-name</i> | Label for the view record that you are updating or creating. The name is used to reference the record. |
| <i>oid-tree</i> | Object identifier of the ASN.1 subtree to be included or excluded from the view. To identify the subtree, specify a text string consisting of numbers, such as 1.3.6.2.4, or a word, such as system. Replace a single subidentifier with the asterisk (*) wildcard to specify a subtree family; for example 1.3.*.4. |
| included | Configures the OID (and subtree OIDs) specified in <i>oid-tree</i> argument to be included in the SNMP view. |
| excluded | Configures the OID (and subtree OIDs) specified in <i>oid-tree</i> argument to be explicitly excluded from the SNMP view. |

Command Default

No view entry exists.

Command Modes

Global configuration

Command History

| Release | Modification |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

Usage Guidelines

Other SNMP commands require an SMP view as an argument. You use this command to create a view to be used as arguments for other commands.

Two standard predefined views can be used when a view is required, instead of defining a view. One is *everything*, which indicates that the user can see all objects. The other is *restricted*, which indicates that the user can see three groups: system, snmpStats, and snmpParties. The predefined views are described in RFC 1447.

The first **snmp-server** command that you enter enables SNMP on your routing device.

Examples

The following example creates a view that includes all objects in the MIB-II subtree:

```
snmp-server view mib2 mib-2 included
```

The following example creates a view that includes all objects in the MIB-II system group and all objects in the Cisco enterprise MIB:

```
snmp-server view root_view system included
snmp-server view root_view cisco included
```

The following example creates a view that includes all objects in the MIB-II system group except for sysServices (System 7) and all objects for interface 1 in the MIB-II interfaces group:

```
snmp-server view agon system included
snmp-server view agon system.7 excluded
snmp-server view agon ifEntry.*.1 included
```

In the following example, the USM, VACM, and Community MIBs are explicitly included in the view “test” with all other MIBs under the root parent “internet”:

```
! -- include all MIBs under the parent tree "internet"
snmp-server view test internet included
! -- include snmpUsmMIB
snmp-server view test 1.3.6.1.6.3.15 included
! -- include snmpVacmMIB
snmp-server view test 1.3.6.1.6.3.16 included
! -- exclude snmpCommunityMIB
snmp-server view test 1.3.6.1.6.3.18 excluded
```

Related Commands

| Command | Description |
|------------------------------|--|
| snmp-server community | Sets up the community access string to permit access to the SNMP protocol. |
| snmp-server manager | Starts the SNMP manager process. |

source

To configure the source IP address interface for all of the packets sent by a Flexible Netflow flow exporter, use the **source** command in flow exporter configuration mode. To remove the source IP address interface for all of the packets sent by a Flexible Netflow flow exporter, use the **no** form of this command.

source *interface-type* *interface-number*

no source

Syntax Description

| | |
|-------------------------|---|
| <i>interface-type</i> | Type of interface whose IP address you want to use for the source IP address of the packets sent by a Flexible Netflow flow exporter. |
| <i>interface-number</i> | Interface number whose IP address you want to use for the source IP address of the packets sent by a Flexible Netflow flow exporter. |

Command Default

The IP address of the interface over which the Flexible Netflow datagram is transmitted is used as the source IP address.

Command Modes

Flow exporter configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The benefits of using a consistent IP source address for the datagrams that Flexible Netflow sends include the following:

- The source IP address of the datagrams exported by Flexible Netflow is used by the destination system to determine from which device the Flexible Netflow data is arriving. If your network has two or more paths that can be used to send Flexible Netflow datagrams from the device to the destination system and you do not specify the source interface from which the source IP address is to be obtained, the device uses the IP address of the interface over which the datagram is transmitted as the source IP address of the datagram. In this situation the destination system might receive Flexible Netflow datagrams from the same device, but with different source IP addresses. When the destination system receives Flexible Netflow datagrams from the same device with different source IP addresses, the destination system treats the Flexible Netflow datagrams as if they were being sent from different devices. To avoid having the destination system treat the Flexible Netflow datagrams as if they were being sent from different devices, you must configure the destination system to aggregate the Flexible Netflow datagrams it receives from all of the possible source IP addresses in the device into a single Flexible Netflow flow.
- If your device has multiple interfaces that can be used to transmit datagrams to the destination system, and you do not configure the **source** command, you will have to add an entry for the IP address of each interface into any access lists that you create for permitting Flexible Netflow traffic. Creating and maintaining access lists for permitting Flexible Netflow traffic from known sources and blocking it from unknown sources is easier when you limit the source IP address for Flexible Netflow datagrams to a single IP address for each device that is exporting Flexible Netflow traffic.

Caution The interface that you configure as the **source** interface must have an IP address configured, and it must be up.

Tip When a transient outage occurs on the interface that you configured with the **source** command, the Flexible Netflow exporter reverts to the default behavior of using the IP address of the interface over which the datagrams are being transmitted as the source IP address for the datagrams. To avoid this problem, use a loopback interface as the source interface because loopback interfaces are not subject to the transient outages that can occur on physical interfaces.

To return this command to its default settings, use the **no source** or **default source** flow exporter configuration command.

Examples

The following example shows how to configure Flexible Netflow to use a loopback interface as the source interface for NetFlow traffic:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# source loopback 0
```

source (ERSPAN)

To configure the Encapsulated Remote Switched Port Analyzer (ERSPAN) source interface or VLAN, and the traffic direction to be monitored, use the **source** command in ERSPAN monitor source session configuration mode. To disable the configuration, use the **no** form of this command.

source {**interface** *type number* | **vlan** *vlan-ID*}[{, | - | **both** | **rx** | **tx**}

Syntax Description

| | |
|-------------------------------------|--|
| interface <i>type number</i> | Specifies an interface type and number. |
| vlan <i>vlan-ID</i> | Associates the ERSPAN source session number with VLANs. Valid values are from 1 to 4094. |
| , | (Optional) Specifies another interface. |
| - | (Optional) Specifies a range of interfaces. |
| both | (Optional) Monitors both received and transmitted ERSPAN traffic. |
| rx | (Optional) Monitors only received traffic. |
| tx | (Optional) Monitors only transmitted traffic. |

Command Default

Source interface or VLAN is not configured.

Command Modes

ERSPAN monitor source session configuration mode (config-mon-erspan-src)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

You cannot include source VLANs and filter VLANs in the same session.

Examples

The following example shows how to configure ERSPAN source session properties:

```
Device(config)# monitor session 2 type erspan-source
Device(config-mon-erspan-src)# source interface fastethernet 0/1 rx
```

Related Commands

| Command | Description |
|-----------------------------|--|
| monitor session type | Configures a local ERSPAN source or destination session. |

socket

To specify the client socket and allow a TCL interpreter to connect via TCP over IPv4/IPv6 and open a TCP network connection use the **socket** command in the TCL configuration mode.

socket myaddr address myport port myvrf vrf-table-name host port

| Syntax Description | myaddr Specifies domain name or numerical IP address of the client-side network interface required for the connection. Use this option especially if the client machine has multiple network interfaces. | | | | |
|-------------------------------|---|---------|--------------|-------------------------------|--|
| myport | Specifies port number that is required for the client's connection. | | | | |
| myvrf | Specifies the vrf table name. If the vrf table is not configured, then the command will return a TCL_ERROR. | | | | |
| Command Default | | | | | |
| Command Modes | TCL configuration mode | | | | |
| Command History | <table border="1"> <thead> <tr> <th style="border-top: 1px solid black; border-bottom: 1px solid black;">Release</th> <th style="border-top: 1px solid black; border-bottom: 1px solid black;">Modification</th> </tr> </thead> <tbody> <tr> <td style="border-bottom: 1px solid black;">Cisco IOS XE Amsterdam 17.2.1</td> <td style="border-bottom: 1px solid black;">The myvrf keyword was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Amsterdam 17.2.1 | The myvrf keyword was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Amsterdam 17.2.1 | The myvrf keyword was introduced. | | | | |

switchport mode access

To sets the interface as a nontrunking nontagged single-VLAN Ethernet interface , use the **switchport mode access** command in template configuration mode. Use the **no** form of this command to return to the default setting.

```
switchport mode access
no switchport mode access
```

| | | |
|---------------------------|---|------------------------------|
| Syntax Description | switchport mode access Sets the interface as a nontrunking nontagged single-VLAN Ethernet interface. | |
| Command Default | An access port can carry traffic in one VLAN only. By default, an access port carries traffic for VLAN1. | |
| Command Modes | Template configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

This example shows how to set a single-VLAN interface

```
Device(config-template)# switchport mode access
```

switchport voice vlan

To specify to forward all voice traffic through the specified VLAN, use the **switchport voice vlan** command in template configuration mode. Use the **no** form of this command to return to the default setting.

```
switchport voice vlan vlan_id
no switchport voice vlan
```

| | |
|---------------------------|--|
| Syntax Description | switchport voice vlan <i>vlan_id</i> Specifies to forward all voice traffic through the specified VLAN. |
|---------------------------|--|

| | |
|------------------------|---|
| Command Default | You can specify a value from 1 to 4094. |
|------------------------|---|

| | |
|----------------------|------------------------|
| Command Modes | Template configuration |
|----------------------|------------------------|

| Command History | Release | Modification |
|------------------------|--|------------------------------|
| | Cisco IOS XE Everest 16.6.1 Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

Examples

This example shows how to specify to forward all voice traffic through the specified VLAN.

```
Device(config-template)# switchport voice vlan 20
```

ttl

To configure the time-to-live (TTL) value, use the **ttl** command in flow exporter configuration mode. To remove the TTL value, use the **no** form of this command.

```
ttl ttl
no ttl ttl
```

| | |
|---------------------------|--|
| Syntax Description | <i>ttl</i> Time-to-live (TTL) value for exported datagrams. The range is 1 to 255. The default is 255. |
|---------------------------|--|

| | |
|------------------------|----------------------------------|
| Command Default | Flow exporters use a TTL of 255. |
|------------------------|----------------------------------|

| | |
|----------------------|-----------------------------|
| Command Modes | Flow exporter configuration |
|----------------------|-----------------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | To return this command to its default settings, use the no ttl or default ttl flow exporter configuration command. |
|-------------------------|--|

The following example specifies a TTL of 15:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# ttl 15
```

transport

To configure the transport protocol for a flow exporter for Flexible Netflow, use the **transport** command in flow exporter configuration mode. To remove the transport protocol for a flow exporter, use the **no** form of this command.

```
transport udp udp-port
no transport udp udp-port
```

| Syntax Description | udp <i>udp-port</i> Specifies User Datagram Protocol (UDP) as the transport protocol and the UDP port number. | | | | |
|-----------------------------|--|---------|--------------|-----------------------------|------------------------------|
| Command Default | Flow exporters use UDP on port 9995. | | | | |
| Command Modes | Flow exporter configuration | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |
| Usage Guidelines | <p>To return this command to its default settings, use the no transport or default transport flow exporter configuration command.</p> <p>The following example configures UDP as the transport protocol and a UDP port number of 250:</p> <pre>Device(config)# flow exporter FLOW-EXPORTER-1 Device(config-flow-exporter)# transport udp 250</pre> | | | | |

template data timeout

To specify a timeout period for resending flow exporter template data, use the **template data timeout** command in flow exporter configuration mode. To remove the template resend timeout for a flow exporter, use the **no** form of this command.

template data timeout *seconds*
no template data timeout *seconds*

| | |
|---------------------------|---|
| Syntax Description | <i>seconds</i> Timeout value in seconds. The range is 1 to 86400. The default is 600. |
|---------------------------|---|

| | |
|------------------------|---|
| Command Default | The default template resend timeout for a flow exporter is 600 seconds. |
|------------------------|---|

| | |
|----------------------|-----------------------------|
| Command Modes | Flow exporter configuration |
|----------------------|-----------------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | <p>Flow exporter template data describes the exported data records. Data records cannot be decoded without the corresponding template. The template data timeout command controls how often those templates are exported.</p> <p>To return this command to its default settings, use the no template data timeout or default template data timeout flow record exporter command.</p> |
|-------------------------|---|

The following example configures resending templates based on a timeout of 1000 seconds:

```
Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# template data timeout 1000
```

udp peek

To enable peeking into a UDP socket use the **udp_peek** command in the TCL configuration mode.

udp_peek *socket* **buffer-size** *buffer-size*

Syntax Description

buffer-size Specifies the buffer size.

Command Default

Command Modes

TCL configuration mode

Command History

Release

Modification

Cisco IOS XE Amsterdam 17.2.1 This command was introduced.

auto qos classify

To automatically configure quality of service (QoS) classification for untrusted devices within a QoS domain, use the **auto qos classify** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

auto qos classify [**police**]
no auto qos classify [**police**]

| | |
|---------------------------|--|
| Syntax Description | police (Optional) Configure QoS policing for untrusted devices. |
|---------------------------|--|

| | |
|------------------------|--|
| Command Default | Auto-QoS classify is disabled on the port. |
|------------------------|--|

| | |
|----------------------|-------------------------|
| Command Modes | Interface configuration |
|----------------------|-------------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS. |
|-------------------------|--|

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

Auto-QoS configures the device for connectivity with a trusted interface. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packets is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

| | |
|-------------|---|
| Note | The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored. |
|-------------|---|

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

The following policy maps and class maps are created and applied when running the **auto qos classify** and **auto qos classify police** commands:

Policy maps (For the **auto qos classify police** command):

- AutoQos-4.0-Classify-Police-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- AutoQos-4.0-Multimedia-Conf-Class (match-any)
- AutoQos-4.0-Bulk-Data-Class (match-any)
- AutoQos-4.0-Transaction-Class (match-any)
- AutoQos-4.0-Scavenger-Class (match-any)
- AutoQos-4.0-Signaling-Class (match-any)
- AutoQos-4.0-Default-Class (match-any)
- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

To disable auto-QoS on a port, use the **no auto qos classify** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos classify** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

Examples

This example shows how to enable auto-QoS classification of an untrusted device and police traffic:

You can verify your settings by entering the **show auto qos interface *interface-id*** privileged EXEC command.

auto qos trust

To automatically configure quality of service (QoS) for trusted interfaces within a QoS domain, use the **auto qos trust** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

```
auto qos trust {cos | dscp}
no auto qos trust {cos | dscp}
```

Syntax Description

cos Trusts the CoS packet classification.

dscp Trusts the DSCP packet classification.

Command Default

Auto-QoS trust is disabled on the port.

Command Modes

Interface configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS. When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

Table 136: Traffic Types, Packet Labels, and Queues

| | VOIP Data Traffic | VOIP Control Traffic | Routing Protocol Traffic | STP ² BPDU ³ Traffic | Real-Time Video Traffic | All Other Traffic |
|-------------------|-------------------|----------------------|--------------------------|--|-------------------------|-------------------|
| DSCP ⁴ | 46 | 24, 26 | 48 | 56 | 34 | – |
| CoS ⁵ | 5 | 3 | 6 | 7 | 3 | – |

² STP = Spanning Tree Protocol

³ BPDU = bridge protocol data unit

⁴ DSCP = Differentiated Services Code Point

⁵ CoS = class of service

Note The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

The following policy maps and class maps are created and applied when running the **auto qos trust cos** command.

Policy maps:

- AutoQos-4.0-Trust-Cos-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos trust dscp** command:

Policy maps:

- AutoQos-4.0-Trust-Dscp-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)

- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

To disable auto-QoS on a port, use the **no auto qos trust** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos trust** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

Examples

This example shows how to enable auto-QoS for a trusted interface with specific CoS classification.

```
Device(config)# interface gigabitethernet1/0/17
Device(config-if)# auto qos trust cos
Device(config-if)# end
Device# show policy-map interface gigabitethernet1/0/17
```

Gigabitethernet1/0/17

```
Service-policy input: AutoQos-4.0-Trust-Cos-Input-Policy
```

```

```

You can verify your settings by entering the **show auto qos interface *interface-id*** privileged EXEC command.

auto qos video

To automatically configure quality of service (QoS) for video within a QoS domain, use the **auto qos video** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

```
auto qos video { cts | ip-camera | media-player }
no auto qos video { cts | ip-camera | media-player }
```

| Syntax Description | Parameter | Description |
|--------------------|---------------------|--|
| | cts | Specifies a port connected to a Cisco TelePresence System and automatically configures QoS for video. |
| | ip-camera | Specifies a port connected to a Cisco IP camera and automatically configures QoS for video. |
| | media-player | Specifies a port connected to a CDP-capable Cisco digital media player and automatically configures QoS for video. |

Command Default Auto-QoS video is disabled on the port.

Command Modes Interface configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use this command to configure the QoS appropriate for video traffic within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS. When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues. For more information, see the queue tables at the end of this section.

Auto-QoS configures the device for video connectivity to a Cisco TelePresence system, a Cisco IP camera, or a Cisco digital media player.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy

map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

The following policy maps and class maps are created and applied when running the **auto qos video cts** command:

Policy maps:

- AutoQos-4.0-Trust-Cos-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos video ip-camera** command:

Policy maps:

- AutoQos-4.0-Trust-Dscp-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos video media-player** command:

Policy maps:

- AutoQos-4.0-Trust-Dscp-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

To disable auto-QoS on a port, use the **no auto qos video** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled, and you enter the **no auto qos video** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

Table 137: Traffic Types, Packet Labels, and Queues

| | VOIP Data Traffic | VOIP Control Traffic | Routing Protocol Traffic | STP ⁶ BPDUs ⁷ Traffic | Real-Time Video Traffic | All Other Traffic |
|-------------------|-------------------|----------------------|--------------------------|---|-------------------------|-------------------|
| DSCP ⁸ | 46 | 24, 26 | 48 | 56 | 34 | – |
| CoS ⁹ | 5 | 3 | 6 | 7 | 3 | – |

⁶ STP = Spanning Tree Protocol

⁷ BPDUs = bridge protocol data unit

⁸ DSCP = Differentiated Services Code Point

⁹ CoS = class of service

Examples

You can verify your settings by entering the **show auto qos video interface *interface-id*** privileged EXEC command.

auto qos voip

To automatically configure quality of service (QoS) for voice over IP (VoIP) within a QoS domain, use the **auto qos voip** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

```
auto qos voip {cisco-phone | cisco-softphone | trust}
no auto qos voip {cisco-phone | cisco-softphone | trust}
```

| Syntax Description | |
|------------------------|--|
| cisco-phone | Specifies a port connected to a Cisco IP phone, and automatically configures QoS for VoIP. The QoS labels of incoming packets are trusted only when the telephone is detected. |
| cisco-softphone | Specifies a port connected to a device running the Cisco SoftPhone, and automatically configures QoS for VoIP. |
| trust | Specifies a port connected to a trusted device, and automatically configures QoS for VoIP. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packet is trusted. For routed ports, the DSCP value of the incoming packet is trusted. |

| Command Default | |
|-----------------|--|
| | Auto-QoS is disabled on the port. |
| | When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues. |

| Command Default | |
|-----------------|-------------------------|
| | Interface configuration |

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| Usage Guidelines | |
|------------------|--|
| | Use this command to configure the QoS appropriate for VoIP traffic within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS. |

Auto-QoS configures the device for VoIP with Cisco IP phones on device and routed ports and for devices running the Cisco SoftPhone application. These releases support only Cisco IP SoftPhone Version 1.3(3) or later. Connected devices must use Cisco Call Manager Version 4 or later.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

Note The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enter the **auto qos voip cisco-phone** interface configuration command on a port at the edge of the network that is connected to a Cisco IP phone, the device enables the trusted boundary feature. The device uses the Cisco Discovery Protocol (CDP) to detect the presence of a Cisco IP phone. When a Cisco IP phone is detected, the ingress classification on the port is set to trust the QoS label received in the packet. The device also uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the device changes the DSCP value to 0. When a Cisco IP phone is absent, the ingress classification is set to not trust the QoS label in the packet. The policing is applied to those traffic matching the policy-map classification before the device enables the trust boundary feature.

- When you enter the **auto qos voip cisco-softphone** interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the device uses policing to decide whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the device changes the DSCP value to 0.
- When you enter the **auto qos voip trust** interface configuration command on a port connected to the network interior, the device trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices).

You can enable auto-QoS on static, dynamic-access, and voice VLAN access, and trunk ports. When enabling auto-QoS with a Cisco IP phone on a routed port, you must assign a static IP address to the IP phone.

Note When a device running Cisco SoftPhone is connected to a device or routed port, the device supports only one Cisco SoftPhone application per port.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

The following policy maps and class maps are created and applied when running the **auto qos voip trust** command:

Policy maps:

- AutoQos-4.0-Trust-Cos-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos voip cisco-softphone** command:

Policy maps:

- AutoQos-4.0-CiscoSoftPhone-Input-Policy
- AutoQos-4.0-Output-Policy

Class maps:

- AutoQos-4.0-Voip-Data-Class (match-any)
- AutoQos-4.0-Voip-Signal-Class (match-any)
- AutoQos-4.0-Multimedia-Conf-Class (match-any)
- AutoQos-4.0-Bulk-Data-Class (match-any)
- AutoQos-4.0-Transaction-Class (match-any)
- AutoQos-4.0-Scavenger-Class (match-any)
- AutoQos-4.0-Signaling-Class (match-any)
- AutoQos-4.0-Default-Class (match-any)
- class-default (match-any)
- AutoQos-4.0-Output-Priority-Queue (match-any)
- AutoQos-4.0-Output-Control-Mgmt-Queue (match-any)
- AutoQos-4.0-Output-Multimedia-Conf-Queue (match-any)
- AutoQos-4.0-Output-Trans-Data-Queue (match-any)
- AutoQos-4.0-Output-Bulk-Data-Queue (match-any)
- AutoQos-4.0-Output-Scavenger-Queue (match-any)

- AutoQos-4.0-Output-Multimedia-Strm-Queue (match-any)

The following policy maps and class maps are created and applied when running the **auto qos voip cisco-phone** command:

Policy maps:

- service-policy input AutoQos-4.0-CiscoPhone-Input-Policy
- service-policy output AutoQos-4.0-Output-Policy

Class maps:

- class AutoQos-4.0-Voip-Data-CiscoPhone-Class
- class AutoQos-4.0-Voip-Signal-CiscoPhone-Class
- class AutoQos-4.0-Default-Class

To disable auto-QoS on a port, use the **no auto qos voip** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

The device configures egress queues on the port according to the settings in this table.

Table 138: Auto-QoS Configuration for the Egress Queues

| Egress Queue | Queue Number | CoS-to-Queue Map | Queue Weight (Bandwidth) | Queue (Buffer) Size for Gigabit-Capable Ports | Queue (Buffer) Size for 10/100 Ethernet Ports |
|-------------------|--------------|------------------|--------------------------|---|---|
| Priority (shaped) | 1 | 4, 5 | Up to 100 percent | 25 percent | 15 percent |
| SRR shared | 2 | 2, 3, 6, 7 | 10 percent | 25 percent | 25 percent |
| SRR shared | 3 | 0 | 60 percent | 25 percent | 40 percent |
| SRR shared | 4 | 1 | 20 percent | 25 percent | 20 percent |

```

You can verify your settings by entering the **show auto qos interface *interface-id*** privileged EXEC command.

class

To define a traffic classification match criteria for the specified class-map name, use the **class** command in policy-map configuration mode. Use the **no** form of this command to delete an existing class map.

```
class {class-map-name | class-default}
no class {class-map-name | class-default}
```

Syntax Description

class-map-name The class map name.

class-default Refers to a system default class that matches unclassified packets.

Command Default

No policy map class-maps are defined.

Command Modes

Policy-map configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Before using the **class** command, you must use the **policy-map** global configuration command to identify the policy map and enter policy-map configuration mode. After specifying a policy map, you can configure a policy for new classes or modify a policy for any existing classes in that policy map. You attach the policy map to a port by using the **service-policy** interface configuration command.

After entering the **class** command, you enter the policy-map class configuration mode. These configuration commands are available:

- **admit**—Admits a request for Call Admission Control (CAC)
- **bandwidth**—Specifies the bandwidth allocated to the class.
- **exit**—Exits the policy-map class configuration mode and returns to policy-map configuration mode.
- **no**—Returns a command to its default setting.
- **police**—Defines a policer or aggregate policer for the classified traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For more information about this command, see *Cisco IOS Quality of Service Solutions Command Reference* available on Cisco.com.
- **priority**—Assigns scheduling priority to a class of traffic belonging to a policy map.
- **queue-buffers**—Configures the queue buffer for the class.
- **queue-limit**—Specifies the maximum number of packets the queue can hold for a class policy configured in a policy map.
- **service-policy**—Configures a QoS service policy.
- **set**—Specifies a value to be assigned to the classified traffic. For more information, see the *set* command.
- **shape**—Specifies average or peak rate traffic shaping. For more information about this command, see *Cisco IOS Quality of Service Solutions Command Reference* available on Cisco.com.

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

The **class** command performs the same function as the **class-map** global configuration command. Use the **class** command when a new classification, which is not shared with any other ports, is needed. Use the **class-map** command when the map is shared among many ports.

You can configure a default class by using the **class class-default** policy-map configuration command. Unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as default traffic.

You can verify your settings by entering the **show policy-map** privileged EXEC command.

Examples

This example shows how to create a policy map called policy1. When attached to the ingress direction, it matches all the incoming traffic defined in class1 and polices the traffic at an average rate of 1 Mb/s and bursts at 1000 bytes, marking down exceeding traffic via a table-map.

```
Device(config)# policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# police cir 1000000 bc 1000 conform-action
transmit exceed-action set-dscp-transmit dscp table EXEC_TABLE
Device(config-pmap-c)# exit
```

This example shows how to configure a default traffic class to a policy map. It also shows how the default traffic class is automatically placed at the end of policy-map pm3 even though **class-default** was configured first:

```
Device# configure terminal
Device(config)# class-map cm-3
Device(config-cmap)# match ip dscp 30
Device(config-cmap)# exit

Device(config)# class-map cm-4
Device(config-cmap)# match ip dscp 40
Device(config-cmap)# exit

Device(config)# policy-map pm3
Device(config-pmap)# class class-default
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# exit

Device(config-pmap)# class cm-3
Device(config-pmap-c)# set dscp 4
Device(config-pmap-c)# exit

Device(config-pmap)# class cm-4
Device(config-pmap-c)# set precedence 5
Device(config-pmap-c)# exit
Device(config-pmap)# exit

Device# show policy-map pm3
Policy Map pm3
  Class cm-3
    set dscp 4
  Class cm-4
    set precedence 5
  Class class-default
    set dscp af11
```

class-map

To create a class map to be used for matching packets to the class whose name you specify and to enter class-map configuration mode, use the **class-map** command in global configuration mode. Use the **no** form of this command to delete an existing class map and to return to global or policy map configuration mode.

```
class-map class-map name {match-any | match-all}
no class-map class-map name {match-any | match-all}
```

| | | |
|---------------------------|---|--|
| Syntax Description | match-any | (Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria must be matched. |
| | match-all | (Optional) Performs a logical-AND of the matching statements under this class map. All criterias must match. |
| | <i>class-map-name</i> | The class map name. |
| Command Default | No class maps are defined. | |
| Command Modes | Global configuration | |
| | Policy map configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Usage Guidelines | Use this command to specify the name of the class for which you want to create or modify class-map match criteria and to enter class-map configuration mode. | |
| | <p>The class-map command and its subcommands are used to define packet classification, marking, and aggregate policing as part of a globally named service policy applied on a per-port basis.</p> <p>After you are in quality of service (QoS) class-map configuration mode, these configuration commands are available:</p> <ul style="list-style-type: none"> • description—Describes the class map (up to 200 characters). The show class-map privileged EXEC command displays the description and the name of the class map. • exit—Exits from QoS class-map configuration mode. • match—Configures classification criteria. • no—Removes a match statement from a class map. <p>If you enter the match-any keyword, you can only use it to specify an extended named access control list (ACL) with the match access-group class-map configuration command.</p> <p>To define packet classification on a physical-port basis, only one match command per class map is supported. The ACL can have multiple access control entries (ACEs).</p> | |

Note You cannot configure IPv4 and IPv6 classification criteria simultaneously in the same class-map. However, they can be configured in different class-maps in the same policy.

Examples

This example shows how to configure the class map called class1 with one match criterion, which is an access list called 103:

```
Device(config)# access-list 103 permit ip any any dscp 10  
Device(config)# class-map class1  
Device(config-cmap)# match access-group 103  
Device(config-cmap)# exit
```

This example shows how to delete the class map class1:

```
Device(config)# no class-map class1
```

You can verify your settings by entering the **show class-map** privileged EXEC command.

debug auto qos

To enable debugging of the automatic quality of service (auto-QoS) feature, use the **debug auto qos** command in privileged EXEC mode. Use the **no** form of this command to disable debugging.

```
debug auto qos
no debug auto qos
```

| | |
|---------------------------|--|
| Syntax Description | This command has no arguments or keywords. |
|---------------------------|--|

| | |
|------------------------|---------------------------------|
| Command Default | Auto-QoS debugging is disabled. |
|------------------------|---------------------------------|

| | |
|----------------------|-----------------|
| Command Modes | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. You enable debugging by entering the debug auto qos privileged EXEC command. |
|-------------------------|---|

The **undebug auto qos** command is the same as the **no debug auto qos** command.

When you enable debugging on a device stack, it is enabled only on the active device. To enable debugging on a stack member, you can start a session from the active device by using the **session switch-number** privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command stack-member-number LINE** privileged EXEC command on the active device to enable debugging on a member device without first starting a session.

Examples

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled:

```
Device# debug auto qos
AutoQoS debugging is on
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# auto qos voip cisco-phone
```

match (class-map configuration)

To define the match criteria to classify traffic, use the **match** command in class-map configuration mode. Use the **no** form of this command to remove the match criteria.

```
match {access-group {name acl-name acl-index} | cos cos-value | dscp dscp-value | [ip] dscp dscp-list | [ip] precedence ip-precedence-list | mpls experimental-value | non-client-nrt | precedence precedence-value1...value4 | protocol protocol-name | qos-group qos-group-value | vlan vlan-id | wlan wlan-id}
```

```
no match {access-group {name acl-name acl-index} | cos cos-value | dscp dscp-value | [ip] dscp dscp-list | [ip] precedence ip-precedence-list | mpls experimental-value | non-client-nrt | precedence precedence-value1...value4 | protocol protocol-name | qos-group qos-group-value | vlan vlan-id | wlan wlan-id}
```

| Syntax Description | | |
|--|--|---|
| access-group | | Specifies an access group. |
| name <i>acl-name</i> | | Specifies the name of an IP standard or extended access control list (ACL) or MAC ACL. |
| <i>acl-index</i> | | Specifies the number of an IP standard or extended access control list (ACL) or MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699. |
| cos <i>cos-value</i> | | Matches a packet on the basis of a Layer 2 class of service (CoS)/Inter-Switch Link (ISL) marking. The <i>cos-value</i> is from 0 to 7. You can specify up to four CoS values in one match cos statement, separated by a space. |
| dscp <i>dscp-value</i> | | Specifies the parameters for each DSCP value. You can specify a value in the range 0 to 63 specifying the differentiated services code point value. |
| ip dscp <i>dscp-list</i> | | Specifies a list of up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value. |
| ip precedence <i>ip-precedence-list</i> | | Specifies a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value. |
| mpls <i>experimental-value</i> | | Specifies Multi Protocol Label Switching specific values. |
| non-client-nrt | | Matches a non-client NRT (non-real-time). |

| | |
|---|--|
| precedence <i>precedence-value1...value4</i> | Assigns an IP precedence value to the classified traffic. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value. |
| protocol <i>protocol-name</i> | Specifies the type of protocol. |
| qos-group <i>qos-group-value</i> | Identifies a specific QoS group value as a match criterion. The range is 0 to 31. |
| vlan <i>vlan-id</i> | Identifies a specific VLAN as a match criterion. The range is 1 to 4094. |
| wlan <i>wlan-id</i> | Identifies 802.11 specific values. |

Command Default

No match criteria are defined.

Command Modes

Class-map configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **match** command is used to specify which fields in the incoming packets are examined to classify the packets. Only the IP access group or the MAC access group matching to the Ether Type/Len are supported.

If you enter the **class-map match-any** *class-map-name* global configuration command, you can enter the following **match** commands:

- **match access-group name** *acl-name*

Note The ACL must be an extended named ACL.

- **match ip dscp** *dscp-list*
- **match ip precedence** *ip-precedence-list*

The **match access-group** *acl-index* command is not supported.

To define packet classification on a physical-port basis, only one **match** command per class map is supported. In this situation, the **match-any** keyword is equivalent.

For the **match ip dscp** *dscp-list* or the **match ip precedence** *ip-precedence-list* command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **match ip dscp af11** command, which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the **match ip precedence 5** command. For a list of supported mnemonics, enter the **match ip dscp ?** or the **match ip precedence ?** command to see the command-line help strings.

Use the **input-interface** *interface-id-list* keyword when you are configuring an interface-level class map in a hierarchical policy map. For the *interface-id-list*, you can specify up to six entries.

Examples

This example shows how to create a class map called class2, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```
Device(config)# class-map class2
Device(config-cmap)# match ip dscp 10 11 12
Device(config-cmap)# exit
```

This example shows how to create a class map called class3, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```
Device(config)# class-map class3
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using acl1:

```
Device(config)# class-map class2
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# no match ip precedence
Device(config-cmap)# match access-group acl1
Device(config-cmap)# exit
```

This example shows how to specify a list of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Device(config)# class-map match-any class4
Device(config-cmap)# match cos 4
Device(config-cmap)# exit
```

This example shows how to specify a range of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Device(config)# class-map match-any class4
Device(config-cmap)# match cos 4
Device(config-cmap)# exit
```

You can verify your settings by entering the **show class-map** privileged EXEC command.

policy-map

To create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode, use the **policy-map** command in global configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

policy-map *policy-map-name*
no policy-map *policy-map-name*

Syntax Description

policy-map-name Name of the policy map.

Command Default

No policy maps are defined.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

After entering the **policy-map** command, you enter policy-map configuration mode, and these configuration commands are available:

- **class**—Defines the classification match criteria for the specified class map.
- **description**—Describes the policy map (up to 200 characters).
- **exit**—Exits policy-map configuration mode and returns you to global configuration mode.
- **no**—Removes a previously defined policy map.
- **sequence-interval**—Enables sequence number capability.

To return to global configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

Before configuring policies for classes whose match criteria are defined in a class map, use the **policy-map** command to specify the name of the policy map to be created, added to, or modified. Entering the **policy-map** command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.

You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the **class-map** global configuration and **match** class-map configuration commands. You define packet classification on a physical-port basis.

Only one policy map per ingress port is supported. You can apply the same policy map to multiple physical ports.

You can apply a nonhierarchical policy maps to physical ports. A nonhierarchical policy map is the same as the port-based policy maps in the device.

A hierarchical policy map has two levels in the format of a parent-child policy. The parent policy cannot be modified but the child policy (port-child policy) can be modified to suit the QoS configuration.

In VLAN-based QoS, a service policy is applied to an SVI interface.

Note Not all MQC QoS combinations are supported for wired ports. For information about these restrictions, see chapters "Restrictions for QoS on Wired Targets" in the QoS configuration guide.

Examples

This example shows how to create a policy map called policy1. When attached to the ingress port, it matches all the incoming traffic defined in class1, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic less than the profile is sent.

```
Device(config)# policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# police 1000000 20000 conform-action transmit
Device(config-pmap-c)# exit
```

This example show you how to configure hierarchical polices:

```
Device# configure terminal
Device(config)# class-map c1
Device(config-cmap)# exit

Device(config)# class-map c2
Device(config-cmap)# exit

Device(config)# policy-map child
Device(config-pmap)# class c1
Device(config-pmap-c)# priority level 1
Device(config-pmap-c)# police rate percent 20 conform-action transmit exceed action drop
Device(config-pmap-c-police)# exit
Device(config-pmap-c)# exit

Device(config-pmap)# class c2
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit

Device(config-pmap)# class class-default
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit
Device(config-pmap)# exit

Device(config)# policy-map parent
Device(config-pmap)# class class-default
Device(config-pmap-c)# shape average 1000000
Device(config-pmap-c)# service-policy child
Device(config-pmap-c)# end
```

This example shows how to delete a policy map:

```
Device(config)# no policy-map policymap2
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

priority

To assign priority to a class of traffic belonging to a policy map, use the **priority** command in policy-map class configuration mode. To remove a previously specified priority for a class, use the **no** form of this command.

```
priority [Kbps [burst -in-bytes] ] | level level-value [Kbps [burst -in-bytes] ] | percent
percentage [Kb/s [burst -in-bytes] ] ]
no priority [Kb/s [burst -in-bytes] ] | level level value [Kb/s [burst -in-bytes] ] | percent
percentage [Kb/s [burst -in-bytes] ] ]
```

| Syntax Description | | |
|----------------------------------|---|--|
| <i>Kb/s</i> | (Optional) Guaranteed allowed bandwidth, in kilobits per second (kbps), for the priority traffic. The amount of guaranteed bandwidth varies according to the interface and platform in use. Beyond the guaranteed bandwidth, the priority traffic will be dropped in the event of congestion to ensure that the nonpriority traffic is not starved. The value must be between 1 and 2,000,000 kbps. | |
| <i>burst -in-bytes</i> | (Optional) Burst size in bytes. The burst size configures the network to accommodate temporary bursts of traffic. The default burst value, which is computed as 200 milliseconds of traffic at the configured bandwidth rate, is used when the burst argument is not specified. The range of the burst is from 32 to 2000000 bytes. | |
| level <i>level-value</i> | (Optional) Assigns priority level. Available values for <i>level-value</i> are 1 and 2. Level 1 is a higher priority than Level 2. Level 1 reserves bandwidth and goes first, so latency is very low. | |
| percent <i>percentage</i> | (Optional) Specifies the amount of guaranteed bandwidth to be specified by the percent of available bandwidth. | |

Command Default No priority is set.

Command Modes Policy-map class configuration (config-pmap-c)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The bandwidth and priority commands cannot be used in the same class, within the same policy map. However, these commands can be used together in the same policy map.

When the policy map containing class policy configurations is attached to the interface to stipulate the service policy for that interface, available bandwidth is assessed. If a policy map cannot be attached to a particular interface because of insufficient interface bandwidth, the policy is removed from all interfaces to which it was successfully attached.

Example

The following example shows how to configure the priority of the class in policy map policy1:

```
Device(config)# class-map cm1
Device(config-cmap)#match precedence 2
Device(config-cmap)#exit

Device(config)#class-map cm2
Device(config-cmap)#match dscp 30
Device(config-cmap)#exit

Device(config)# policy-map policy1
Device(config-pmap)# class cm1
Device(config-pmap-c)# priority level 1
Device(config-pmap-c)# police 1m
Device(config-pmap-c-police)#exit
Device(config-pmap-c)#exit
Device(config-pmap)#exit

Device(config)#policy-map policy1
Device(config-pmap)#class cm2
Device(config-pmap-c)#priority level 2
Device(config-pmap-c)#police 1m
```

qos queue-softmax-multiplier

To increase the value of the soft buffers used by an interface, use the **qos queue-softmax-multiplier** command in the global configuration mode.

qos queue-softmax-multiplier *range-of-multiplier*
no qos queue-softmax-multiplier *range-of-multiplier*

| Syntax Description | <i>range-of-multiplier</i> | You can specify a value in the range of 100 to 1200. The default value is 100. | | | | |
|-----------------------------|---|--|--------------|-----------------------------|------------------------------|--|
| Command Default | None | | | | | |
| Command Modes | Global configuration (config) | | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. | |
| Release | Modification | | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | | |

Examples

This example shows how to set the value of softmax buffer to 500:

```
Device> enable
Device# configure terminal
Device(config)# qos queue-softmax-multiplier 500
```

queue-buffers ratio

To configure the queue buffer for the class, use the **queue-buffers ratio** command in policy-map class configuration mode. Use the **no** form of this command to remove the ratio limit.

queue-buffers ratio *ratio limit*
no queue-buffers ratio *ratio limit*

| Syntax Description | <i>ratio limit</i> (Optional) Configures the queue buffer for the class. Enter the queue buffers ratio limit (0-100). | | | | |
|-----------------------------|--|---------|--------------|-----------------------------|------------------------------|
| Command Default | No queue buffer for the class is defined. | | | | |
| Command Modes | Policy-map class configuration (config-pmap-c) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |
| Usage Guidelines | <p>Either the bandwidth, shape, or priority command must be used before using this command. For more information about these commands, see <i>Cisco IOS Quality of Service Solutions Command Reference</i> available on Cisco.com</p> <p>The device allows you to allocate buffers to queues. If buffers are not allocated, then they are divided equally amongst all queues. You can use the queue-buffer ratio to divide it in a particular ratio. The buffers are soft buffers because Dynamic Threshold and Scaling (DTS) is active on all queues by default.</p> | | | | |

Example

The following example sets the queue buffers ratio to 10 percent:

```
Device(config)# policy-map policy_queuebuf01
Device(config-pmap)# class-map class_queuebuf01
Device(config-cmap)# exit
Device(config)# policy policy_queuebuf01
Device(config-pmap)# class class_queuebuf01
Device(config-pmap-c)# bandwidth percent 80
Device(config-pmap-c)# queue-buffers ratio 10
Device(config-pmap)# end
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

queue-limit

To specify or modify the maximum number of packets the queue can hold for a class policy configured in a policy map, use the **queue-limit** policy-map class configuration command. To remove the queue packet limit from a class, use the **no** form of this command.

queue-limit *queue-limit-size* [{**packets**}] {**cos** *cos-value* | **dscp** *dscp-value*} **percent** *percentage-of-packets*
no queue-limit *queue-limit-size* [{**packets**}] {**cos** *cos-value* | **dscp** *dscp-value*} **percent** *percentage-of-packets*

| Syntax Description | | |
|---|--|---|
| <i>queue-limit-size</i> | | The maximum size of the queue. The maximum varies according to the optional unit of measure keyword specified (bytes, ms, us, or packets). |
| cos <i>cos-value</i> | | Specifies parameters for each cos value. CoS values are from 0 to 7. |
| dscp <i>dscp-value</i> | | Specifies parameters for each DSCP value. You can specify a value in the range 0 to 63 specifying the differentiated services code point value for the type of queue limit . |
| percent <i>percentage-of-packets</i> | | A percentage in the range 1 to 100 specifying the maximum percentage of packets that the queue for this class can accumulate. |

Command Default None

Command Modes Policy-map class configuration (policy-map-c)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Although visible in the command line help-strings, the **packets** unit of measure is not supported; use the **percent** unit of measure.

Note This command is supported only on wired ports in the egress direction.

Weighted fair queuing (WFQ) creates a queue for every class for which a class map is defined. Packets satisfying the match criteria for a class accumulate in the queue reserved for the class until they are sent, which occurs when the queue is serviced by the fair queuing process. When the maximum packet threshold you defined for the class is reached, queuing of any further packets to the class queue causes tail drop.

You use queue limits to configure Weighted Tail Drop (WTD). WTD ensures the configuration of more than one threshold per queue. Each class of service is dropped at a different threshold value to provide for QoS differentiation.

You can configure the maximum queue thresholds for the different subclasses of traffic, that is, DSCP and CoS and configure the maximum queue thresholds for each subclass.

Example

The following example configures a policy map called port-queue to contain policy for a class called dscp-1. The policy for this class is set so that the queue reserved for it has a maximum packet limit of 20 percent:

```
Device(config)# policy-map policy11
Device(config-pmap)# class dscp-1
Device(config-pmap-c)# bandwidth percent 20
Device(config-pmap-c)# queue-limit dscp 1 percent 20
```

random-detect cos

To change the minimum and maximum packet thresholds for the Class of service (CoS) value, use the **random-detect cos** command in QoS policy-map class configuration mode. To return the minimum and maximum packet thresholds to the default for the CoS value, use the **no** form of this command.

random-detect cos *cos-value* **percent** *min-threshold* *max-threshold*
no random-detect cos *cos-value* **percent***min-threshold* *max-threshold*

| Syntax Description | |
|----------------------|---|
| <i>cos-value</i> | The CoS value, which is IEEE 802.1Q/ISL class of service/user priority value. The CoS value can be a number from 0 to 7. |
| percent | Specifies that the minimum and threshold values are in percentage. |
| <i>min-threshold</i> | Minimum threshold in number of packets. The value range of this argument is from 1 to 512000000. When the average queue length reaches the minimum threshold, Weighted Random Early Detection (WRED) randomly drop some packets with the specified CoS value. |
| <i>max-threshold</i> | Maximum threshold in number of packets. The value range of this argument is from the value of the <i>min-threshold</i> argument to 512000000. When the average queue length exceeds the maximum threshold, WRED or dWRED drop all packets with the specified CoS value. |

Command Modes

QoS policy-map class configuration (config-pmap-c)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **random-detect cos** command in conjunction with the **random-detect** command in QoS policy-map class configuration mode.

The **random-detect cos** command is available only if you have specified the *cos-based* argument when using the **random-detect** command in interface configuration mode.

Examples

The following example enables WRED to use the CoS value 8. The minimum threshold for the CoS value 8 is 20, the maximum threshold is 40.

```
random-detect cos-based
random-detect cos percent 5 20 40
```

Related Commands

| Command | Description |
|----------------------|---|
| random-detect | Enables WRED |
| show queueing | Lists all or selected configured queueing strategies. |

random-detect cos-based

To enable weighted random early detection (WRED) on the basis of the class of service (CoS) value of a packet, use the **random-detect cos-based** command in policy-map class configuration mode. To disable WRED, use the **no** form of this command.

random-detect cos-based
no random-detect cos-based

Command Default

When WRED is configured, the default minimum and maximum thresholds are determined on the basis of output buffering capacity and the transmission speed for the interface.

Command Modes

Policy-map class configuration (config-pmap-c)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

In the following example, WRED is configured on the basis of the CoS value.

```
Device> enable
Device# configure terminal
Device(config)# policy-map policymap1
Device(config-pmap)# class class1
Device(config-pmap-c)# random-detect cos-based
Device(config-pmap-c)#

end
```

Related Commands

| Command | Description |
|----------------------------------|---|
| random-detect cos | Specifies the CoS value of a packet, the minimum and maximum thresholds, and the maximum probability denominator used for enabling WRED. |
| show policy-map | Displays the configuration of all classes for a specified service policy map or all classes for all existing policy maps. |
| show policy-map interface | Displays the packet statistics of all classes that are configured for all service policies either on the specified interface or subinterface or on a specific PVC on the interface. |

random-detect dscp

To change the minimum and maximum packet thresholds for the differentiated services code point (DSCP) value, use the **random-detect dscp** command in QoS policy-map class configuration mode. To return the minimum and maximum packet thresholds to the default for the DSCP value, use the **no** form of this command.

random-detect dscp *dscp-value* **percent** *min-threshold* *max-threshold*
no random-detect dscp *dscp-value* **percent***min-threshold* *max-threshold*

| Syntax Description | |
|----------------------|---|
| <i>dscp-value</i> | The DSCP value. The DSCP value can be a number from 0 to 63, or it can be one of the following keywords: af11 , af12 , af13 , af21 , af22 , af23 , af31 , af32 , af33 , af41 , af42 , af43 , cs1 , cs2 , cs3 , cs4 , cs5 , cs7 , ef , or rsvp . |
| percent | Specifies that the minimum and threshold values are in percentage. |
| <i>min-threshold</i> | Minimum threshold in number of packets. The value range of this argument is from 1 to 512000000. When the average queue length reaches the minimum threshold, Weighted Random Early Detection (WRED) randomly drop some packets with the specified DSCP value. |
| <i>max-threshold</i> | Maximum threshold in number of packets. The value range of this argument is from the value of the <i>min-threshold</i> argument to 512000000. When the average queue length exceeds the maximum threshold, WRED or dWRED drop all packets with the specified DSCP value. |

Command Modes

QoS policy-map class configuration (config-pmap-c)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **random-detect dscp** command in conjunction with the **random-detect** command in QoS policy-map class configuration mode.

The **random-detect dscp** command is available only if you specified the *dscp-based* argument when using the **random-detect** command in interface configuration mode.

Specifying the DSCP Value

The **random-detect dscp** command allows you to specify the DSCP value per traffic class. The DSCP value can be a number from 0 to 63, or it can be one of the following keywords: **af11**, **af12**, **af13**, **af21**, **af22**, **af23**, **af31**, **af32**, **af33**, **af41**, **af42**, **af43**, **cs1**, **cs2**, **cs3**, **cs4**, **cs5**, **cs7**, **ef**, or **rsvp**.

On a particular traffic class, eight DSCP values can be configured per traffic class. Overall, 29 values can be configured on a traffic class: 8 precedence values, 12 Assured Forwarding (AF) code points, 1 Expedited Forwarding code point, and 8 user-defined DSCP values.

Assured Forwarding Code Points

The AF code points provide a means for a domain to offer four different levels (four different AF classes) of forwarding assurances for IP packets received from other (such as customer) domains. Each one of the four AF classes is allocated a certain amount of forwarding services (buffer space and bandwidth).

Within each AF class, IP packets are marked with one of three possible drop precedence values (binary 2{010}, 4{100}, or 6{110}), which exist as the three lowest bits in the DSCP header. In congested network environments, the drop precedence value of the packet determines the importance of the packet within the AF class. Packets with higher drop precedence values are discarded before packets with lower drop precedence values.

The upper three bits of the DSCP value determine the AF class; the lower three values determine the drop probability.

Examples

The following example enables WRED to use the DSCP value 8. The minimum threshold for the DSCP value 8 is 20, the maximum threshold is 40, and the mark probability is 1/10.

```
random-detect dscp percent 8 20 40
```

Related Commands

| Command | Description |
|----------------------|---|
| random-detect | Enables WRED |
| show queueing | Lists all or selected configured queueing strategies. |

random-detect dscp-based

To base weighted random early detection (WRED) on the Differentiated Services Code Point (dscp) value of a packet, use the **random-detectdscp-based** command in policy-map class configuration mode. To disable this feature, use the **no** form of this command.

random-detect dscp-based
no random-detect dscp-based

Syntax Description This command has no arguments or keywords.

Command Default WRED is disabled by default.

Command Modes Policy-map class configuration (config-pmap-c)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines With the **random-detectdscp-based** command, WRED is based on the dscp value of the packet. Use the **random-detectdscp-based** command before configuring the **random-detectdscp** command.

Examples The following example shows that random detect is based on the precedence value of a packet:

```
Device> enable
Device# configure terminal
Device(config)#

policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# bandwidth percent 80
Device(config-pmap-c)# random-detect dscp-based
Device(config-pmap-c)# random-detect dscp 2 percent 10 40
Device(config-pmap-c)# exit
```

| Related Commands | Command | Description |
|------------------|---------------------------|--|
| | random-detect | Enables WRED. |
| | random-detect dscp | Configures the WRED parameters for a particular DSCP value for a class policy in a policy map. |

random-detect precedence

To configure Weighted Random Early Detection (WRED) parameters for a particular IP precedence for a class policy in a policy map, use the **random-detect precedence** command in QoS policy-map class configuration mode. To return the values to the default for the precedence, use the **no** form of this command.

random-detect precedence *precedence percent min-threshold max-threshold*
no random-detect precedence

Syntax Description

| | |
|----------------------|---|
| <i>precedence</i> | IP precedence number. The value range is from 0 to 7; see Table 1 in the “Usage Guidelines” section. |
| percent | Indicates that the threshold values are in percentage. |
| <i>min-threshold</i> | Minimum threshold in number of packets. The value range of this argument is from 1 to 512000000. When the average queue length reaches the minimum threshold, WRED randomly drops some packets with the specified IP precedence. |
| <i>max-threshold</i> | Maximum threshold in number of packets. The value range of this argument is from the value of the <i>min-threshold</i> argument to 512000000. When the average queue length exceeds the maximum threshold, WRED or dWRED drop all packets with the specified IP precedence. |

Command Default

The default *min-threshold* value depends on the precedence. The *min-threshold* value for IP precedence 0 corresponds to half of the *max-threshold* value. The values for the remaining precedences fall between half the *max-threshold* value and the *max-threshold* value at evenly spaced intervals. See the table in the “Usage Guidelines” section of this command for a list of the default minimum threshold values for each IP precedence.

Command Modes

Interface configuration (config-if)
 QoS policy-map class configuration (config-pmap-c)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

WRED is a congestion avoidance mechanism that slows traffic by randomly dropping packets when congestion exists.

When you configure the **random-detect** command on an interface, packets are given preferential treatment based on the IP precedence of the packet. Use the **random-detect precedence** command to adjust the treatment for different precedences.

If you want WRED to ignore the precedence when determining which packets to drop, enter this command with the same parameters for each precedence. Remember to use appropriate values for the minimum and maximum thresholds.

Note that if you use the **random-detect precedence** command to adjust the treatment for different precedences within class policy, you must ensure that WRED is not configured for the interface to which you attach that service policy.

Note Although the range of values for the *min-threshold* and *max-threshold* arguments is from 1 to 512000000, the actual values that you can specify depend on the type of random detect you are configuring. For example, the maximum threshold value cannot exceed the queue limit.

Examples

The following example shows the configuration to enable WRED on the interface and to specify parameters for the different IP precedences:

```
interface FortyGigE1/0/1
 description 45Mbps to R1
 ip address 10.200.14.250 255.255.255.252
 random-detect
 random-detect precedence 7 percent 20 50
```

Related Commands

| Command | Description |
|-------------------------------------|--|
| bandwidth (policy-map class) | Specifies or modifies the bandwidth allocated for a class belonging to a policy map. |
| random-detect dscp | Changes the minimum and maximum packet thresholds for the DSCP value. |
| show policy-map interface | Displays the configuration of all classes configured for all service policies on the specified interface or displays the classes for the service policy for a specific PVC on the interface. |
| show queuing | Lists all or selected configured queuing strategies. |

random-detect precedence-based

To base weighted random early detection (WRED) on the precedence value of a packet, use the **random-detect precedence-based** command in policy-map class configuration mode. To disable this feature, use the **no** form of this command.

random-detect precedence-based
no random-detect precedence-based

Syntax Description This command has no arguments or keywords.

Command Default WRED is disabled by default.

Command Modes Policy-map class configuration (config-pmap-c)

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines With the **random-detect precedence-based** command, WRED is based on the IP precedence value of the packet.

Use the **random-detect precedence-based** command before configuring the **random-detect precedence-based** command.

Examples The following example shows that random detect is based on the precedence value of a packet:

```
Device> enable
Device# configure terminal
Device(config)#

policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# bandwidth percent 80
Device(config-pmap-c)# random-detect precedence-based
Device(config-pmap-c)# random-detect precedence 2 percent 30 50
Device(config-pmap-c)# exit
```

| Command | Description |
|---------------------------------|---|
| random-detect | Enables WRED. |
| random-detect precedence | Configures the WRED parameters for a particular IP precedence for a class policy in a policy map. |

service-policy (Wired)

To apply a policy map to a physical port or a switch virtual interface (SVI), use the **service-policy** command in interface configuration mode. Use the **no** form of this command to remove the policy map and port association.

```
service-policy {input | output} policy-map-name
no service-policy {input | output} policy-map-name
```

| Syntax Description | <p>input <i>policy-map-name</i> Apply the specified policy map to the input of a physical port or an SVI.</p> <p>output <i>policy-map-name</i> Apply the specified policy map to the output of a physical port or an SVI.</p> | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | No policy maps are attached to the port. | | | | |
| Command Modes | WLAN interface configuration | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines

A policy map is defined by the **policy map** command.

Only one policy map is supported per port, per direction. In other words, only one input policy and one output policy is allowed on any one port.

You can apply a policy map to incoming traffic on a physical port or on an SVI.

Examples

This example shows how to apply plcmap1 to an physical ingress port:

```
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# service-policy input plcmap1
```

This example shows how to remove plcmap2 from a physical port:

```
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# no service-policy input plcmap2
```

The following example displays a VLAN policer configuration. At the end of this configuration, the VLAN policy map is applied to an interface for QoS:

```
Device# configure terminal
Device(config)# class-map vlan100
Device(config-cmap)# match vlan 100
Device(config-cmap)# exit
Device(config)# policy-map vlan100
Device(config-pmap)# policy-map class vlan100
Device(config-pmap-c)# police 100000 bc conform-action transmit exceed-action drop
Device(config-pmap-c-police)# end
Device# configure terminal
```

```
Device(config)# interface gigabitethernet 1/0/5  
Device(config-if)# service-policy input vlan100
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

set

To classify IP traffic by setting a Differentiated Services Code Point (DSCP) or an IP-precedence value in the packet, use the **set** command in policy-map class configuration mode. Use the **no** form of this command to remove traffic classification.

set

cos | dscp | precedence | ip | qos-group

set cos

{cos-value} | **{cos | dscp | precedence | qos-group}** [**{table table-map-name}**]

set dscp

{dscp-value} | **{cos | dscp | precedence | qos-group}** [**{table table-map-name}**]

set ip {dscp | precedence}

set precedence *{precedence-value}* | **{cos | dscp | precedence | qos-group}** [**{table table-map-name}**]

set qos-group

{qos-group-value | dscp} [**{table table-map-name}**] | **precedence** [**{table table-map-name}**];

Syntax Description**cos**

Sets the Layer 2 class of service (CoS) value or user priority of an outgoing packet. You can specify these values:

- *cos-value*—CoS value from 0 to 7. You also can enter a mnemonic name for a commonly used value.
- Specify a packet-marking category to set the CoS value of the packet. If you also configure a table map for mapping and converting packet-marking values, this establishes the "map from" packet-marking category. Packet-marking category keywords:
 - **cos**—Sets a value from the CoS value or user priority.
 - **dscp**—Sets a value from packet differentiated services code point (DSCP).
 - **precedence**—Sets a value from packet precedence.
 - **qos-group**—Sets a value from the QoS group.
- (Optional) **table** *table-map-name*—Indicates that the values set in a specified table map are used to set the CoS value. Enter the name of the table map used to specify the CoS value. The table map name can be a maximum of 64 alphanumeric characters.

If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the CoS value. For example, if you enter the **set cos precedence** command, the precedence (packet-marking category) value is copied and used as the CoS value.

dscp

Sets the differentiated services code point (DSCP) value to mark IP(v4) and IPv6 packets. You can specify these values:

- **cos-value**—Number that sets the DSCP value. The range is from 0 to 63. You also can enter a mnemonic name for a commonly used value.
- Specify a packet-marking category to set the DSCP value of the packet. If you also configure a table map for mapping and converting packet-marking values, this establishes the "map from" packet-marking category. Packet-marking category keywords:
 - **cos**—Sets a value from the CoS value or user priority.
 - **dscp**—Sets a value from packet differentiated services code point (DSCP).
 - **precedence**—Sets a value from packet precedence.
 - **qos-group**—Sets a value from the QoS group.
- (Optional)**table** *table-map-name*—Indicates that the values set in a specified table map will be used to set the DSCP value. Enter the name of the table map used to specify the DSCP value. The table map name can be a maximum of 64 alphanumeric characters.

If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the DSCP value. For example, if you enter the **set dscp cos** command, the CoS value (packet-marking category) is copied and used as the DSCP value.

ip

Sets IP values to the classified traffic. You can specify these values:

- **dscp**—Specify an IP DSCP value from 0 to 63 or a packet marking category.
 - **precedence**—Specify a precedence-bit value in the IP header; valid values are from 0 to 7 or specify a packet marking category.
-

precedence

Sets the precedence value in the packet header. You can specify these values:

- *precedence-value*— Sets the precedence bit in the packet header; valid values are from 0 to 7. You also can enter a mnemonic name for a commonly used value.
- Specify a packet marking category to set the precedence value of the packet.
 - **cos**—Sets a value from the CoS or user priority.
 - **dscp**—Sets a value from packet differentiated services code point (DSCP).
 - **precedence**—Sets a value from packet precedence.
 - **qos-group**—Sets a value from the QoS group.
- (Optional) **table** *table-map-name*—Indicates that the values set in a specified table map will be used to set the precedence value. Enter the name of the table map used to specify the precedence value. The table map name can be a maximum of 64 alphanumeric characters.

If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the precedence value. For example, if you enter the **set precedence cos** command, the CoS value (packet-marking category) is copied and used as the precedence value.

| | |
|------------------|---|
| qos-group | <p>Assigns a QoS group identifier that can be used later to classify packets.</p> <ul style="list-style-type: none"> • <i>qos-group-value</i>—Sets a QoS value to the classified traffic. The range is 0 to 31. You also can enter a mnemonic name for a commonly used value. • dscp—Sets the original DSCP field value of the packet as the QoS group value. • precedence—Sets the original precedence field value of the packet as the QoS group value. • (Optional)table <i>table-map-name</i>—Indicates that the values set in a specified table map will be used to set the DSCP or precedence value. Enter the name of the table map used to specify the value. The table map name can be a maximum of 64 alphanumeric characters. <p>If you specify a packet-marking category (dscp or precedence) but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the QoS group value. For example, if you enter the set qos-group precedence command, the precedence value (packet-marking category) is copied and used as the QoS group value.</p> |
|------------------|---|

| Command Modes | Policy-map class configuration |
|----------------------|--------------------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|---------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was i |

| | |
|-------------------------|--|
| Usage Guidelines | <p>For the set dscp <i>dscp-value</i> command, the set cos <i>cos-value</i> command, and the set ip precedence <i>precedence-value</i> command, you can enter a mnemonic name for a commonly used value. For example, you can enter the set dscp af11 command, which is the same as entering the set dscp 10 command. You can enter the set ip precedence critical command, which is the same as entering the set ip precedence 5 command. For a list of supported mnemonics, enter the set dscp ? or the set ip precedence ? command to see the command-line help strings.</p> |
|-------------------------|--|

When you configure the **set dscp cos** command, note the following: The CoS value is a 3-bit field, and the DSCP value is a 6-bit field. Only the three bits of the CoS field are used.

When you configure the **set dscp qos-group** command, note the following:

- The valid range for the DSCP value is a number from 0 to 63. The valid value range for the QoS group is a number from 0 to 99.
- If a QoS group value falls within both value ranges (for example, 44), the packet-marking value is copied and the packets is marked.

- If QoS group value exceeds the DSCP range (for example, 77), the packet-marking value is not be copied and the packet is not marked. No action is taken.

The **set qos-group** command cannot be applied until you create a service policy in policy-map configuration mode and then attach the service policy to an interface or ATM virtual circuit (VC).

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

Examples

This example shows how to assign DSCP 10 to all FTP traffic without any policers:

```
Device(config)# policy-map policy_ftp
Device(config-pmap)# class-map ftp_class
Device(config-cmap)# exit
Device(config)# policy policy_ftp
Device(config-pmap)# class ftp_class
Device(config-pmap-c)# set dscp 10
Device(config-pmap)# exit
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

show auto qos

To display the quality of service (QoS) commands entered on the interfaces on which automatic QoS (auto-QoS) is enabled, use the **show auto qos** command in privileged EXEC mode.

```
show auto qos [interface [interface-id]]
```

| | | |
|---------------------------|---|--|
| Syntax Description | interface [<i>interface-id</i>] | (Optional) Displays auto-QoS information for the specified port or for all ports. Valid interfaces include physical ports. |
| Command Modes | User EXEC Privileged EXEC | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **show auto qos** command output shows only the **auto qos** command entered on each interface. The **show auto qos interface interface-id** command output shows the **auto qos** command entered on a specific interface. Use the **show running-config** privileged EXEC command to display the auto-QoS configuration and the user modifications.

Examples

This is an example of output from the **show auto qos** command after the **auto qos voip cisco-phone** and the **auto qos voip cisco-softphone** interface configuration commands are entered:

```
Device# show auto qos
GigabitEthernet 2/0/4
auto qos voip cisco-softphone

GigabitEthernet 2/0/5
auto qos voip cisco-phone

GigabitEthernet 2/0/6
auto qos voip cisco-phone
```

This is an example of output from the **show auto qos interface interface-id** command when the **auto qos voip cisco-phone** interface configuration command is entered:

```
Device# show auto qos interface GigabitEthernet 2/0/5
GigabitEthernet 2/0/5
auto qos voip cisco-phone
```

These are examples of output from the **show auto qos interface interface-id** command when auto-QoS is disabled on an interface:

```
Device# show auto qos interface GigabitEthernet 3/0/1
```

```
AutoQoS is disabled
```

show class-map

To display quality of service (QoS) class maps, which define the match criteria to classify traffic, use the **show class-map** command in EXEC mode.

```
show class-map [class-map-name | type control subscriber {all | class-map-name}]
```

Syntax Description

| | |
|--------------------------------|---|
| <i>class-map-name</i> | (Optional) Class map name. |
| type control subscriber | (Optional) Displays information about control class maps. |
| all | (Optional) Displays information about all control class maps. |

Command Modes

User EXEC
Privileged EXEC

Command History

Examples

This is an example of output from the **show class-map** command:

```
Device# show class-map
Class Map match-any videowizard_10-10-10-10 (id 2)
  Match access-group name videowizard_10-10-10-10

Class Map match-any class-default (id 0)
  Match any
Class Map match-any dscp5 (id 3)
  Match ip dscp 5
```

show platform hardware fed active qos

To display device-specific hardware information, use the **show platform hardware fed active qos** command.

This topic elaborates only the QoS-specific options, that is, the options available with the **show platform hardware fed {active | standby} qos** command.

```
show platform hardware fed {active | standby} qos {afd | {config type type [{asic asic_num}] | stats
clients {all | bssid id}} | dscp-cos counters {iifd_id id | interface type number} | le-info {iifd_id id | interface
type number} | policer config {iifd_id id | interface type number} | queue | {config | {iifd_id id | interface
type number | internal port-type type {asic number [{port_num}]}} | label2qmap [{aqmrepqostbl |
iqslabtable | sqslabtable}] | {asicnumber} | stats | {iifd_id id | interface type number | internal {cpu
policer | port-type type asic number} {asicnumber [{port_num}]}} | resource}
```

Syntax Description

{active | standby} Switch for which you want to display information. You have the following options:

- **active**—Displays information relating to the active switch.
- **standby**—Displays information relating to the standby switch, if available.

qos

Displays QoS hardware information. You must choose from the following options:

- **afd**—Displays Approximate Fair Drop (AFD) information in hardware.
- **dscp-cos**—Displays information dscp-cos counters for each port.
- **leinfo**—Displays logical entity information.
- **policer**—Displays QoS policer information in hardware.
- **queue**—Displays queue information in hardware.
- **resource**—Displays hardware resource information.

afd {config type | stats client }

You must choose from the options under **config type** or **stats client** :

config type:

- **client**—Displays wireless client information
- **port**—Displays port-specific information

stats client :

- **all**—Displays statistics of all client.
- **bssid**—Valid range is from 1 to 4294967295.

asicasic_num

(Optional) ASIC number. Valid range is from 0 to 255.

| | |
|---|--|
| dscp-cos counters { iif_id <i>id</i> interface <i>type number</i> } | Displays per port dscp-cos counters. You must choose from the following options under dscp-cos counters : <ul style="list-style-type: none"> • iif_id <i>id</i>—The target interface ID. Valid range is from 1 to 4294967295. • interface <i>type number</i>—Target interface type and ID. |
| leinfo | You must choose from the following options under leinfo : <ul style="list-style-type: none"> • iif_id <i>id</i>—The target interface ID. Valid range is from 1 to 4294967295. • interface <i>type number</i>—Target interface type and ID. |
| policer config | Displays configuration information related to policers in hardware. You must choose from the following options: <ul style="list-style-type: none"> • iif_id <i>id</i>—The target interface ID. Valid range is from 1 to 4294967295. • interface <i>type number</i>—Target interface type and ID. |
| queue { config { iif_id <i>id</i> interface <i>type number</i> internal } label2qmap stats } | Displays queue information in hardware. You must choose from the following options: <ul style="list-style-type: none"> • config—Configuration information. You must choose from the following options: <ul style="list-style-type: none"> • iif_id <i>id</i>—The target interface ID. Valid range is from 1 to 4294967295. • interface <i>type number</i>—Target interface type and ID. • internal—Displays internal queue related information. • label2qmap—Displays hardware label to queue mapping information. You can choose from the following options: <ul style="list-style-type: none"> • (Optional) aqmrepqostbl—AQM REP QoS label table lookup. • (Optional) iqslabeltable—IQS QoS label table lookup. • (Optional) sqslabeltable—SQS and local QoS label table lookup. • stats—Displays queue statistics. You must choose from the following options: <ul style="list-style-type: none"> • iif_id <i>id</i>—The target interface ID. Valid range is from 1 to 4294967295. • interface <i>type number</i>—Target interface type and ID. • internal { cpu policer port_type <i>port_type</i> asic <i>asic_num</i> [port_num <i>port_num</i>] }—Displays internal queue related information. |
| resource | Displays hardware resource usage information. You must enter the following keyword: usage |

show platform software fed active qos

To display device-specific software information, use the **show platform hardware fed {active | standby}** command.

This topic elaborates only the QoS-specific options available with the **show platform software fed {active | standby} qos** command.

show platform software fed {active | standby} qos {avc | internal | label2qmap | nflqos | policer | policy | qsb | tablemap}

Syntax Description

{active | standby} The device for which you want to display information.

- **active**—Displays information for the active switch.
- **standby**—Displays information for the standby switch, if available.

qos

Displays QoS software information. Choose one the following options:

- **avc** : Displays Application Visibility and Control (AVC) QoS information.
- **internal**: Displays internal queue-related information.
- **label2qmap**: Displays label to queue map table information.
- **nflqos**: Displays NetFlow QoS information.
- **policer**: Displays QoS policer information in hardware.
- **policy**: Displays QoS policy information.
- **qsb**: Displays QoS sub-block information.
- **tablemap**: Displays table mapping information for QoS egress and ingress queues.

Cisco IOS XE Everest 16.6.1

Modification

This command was introduced.

show policy-map

To display quality of service (QoS) policy maps, which define classification criteria for incoming traffic, use the **show policy-map** command in EXEC mode.

```
show policy-map [{policy-map-name | interface interface-id}]
```

```
show policy-map interface {Auto-template | Capwap | GigabitEthernet | GroupVI |
InternalInterface | Loopback | Lspvif | Null | Port-channel | TenGigabitEthernet | Tunnel
| Vlan | brief | class | input | output}
```

```
show policy-map type control subscriber detail
```

| Syntax Description | | |
|--------------------|---------------------------------------|--|
| | <i>policy-map-name</i> | (Optional) Name of the policy-map. |
| | interface <i>interface-id</i> | (Optional) Displays the statistics and the configurations of the input and output policies that are attached to the interface. |
| | type control subscriber detail | (Optional) Identifies the type of QoS policy and the statistics. |

| Command Modes | |
|---------------|-----------------|
| | User EXEC |
| | Privileged EXEC |

| Command History | Release | Modification |
|-----------------|-----------------------------|--------------|
| | Cisco IOS XE Everest 16.6.1 | This command |

Usage Guidelines Policy maps can include policers that specify the bandwidth limitations and the action to take if the limits are exceeded.

Note Though visible in the command-line help string, the **control-plane**, **session**, and **type** keywords are not supported, and the statistics shown in the display should be ignored.

This is an example of the output for the **show policy-map interface** command.

```
Device# show policy-map interface gigabitethernet 1/0/48

Service-policy output: port_shape_parent

Class-map: class-default (match-any)

show tech-support qos

To display quality of service (QoS)-related information for use by technical support, use the **show tech-support qos** command in privileged EXEC mode.

show tech-support qos [{**active** | **all** | **standby**} [**control-plane** | **interface** *interface-name*]]

| Syntax Description | | |
|--------------------|--|---|
| | switch <i>switch-number</i> | (Optional) Displays QoS-related information for a specific switch. |
| | active | (Optional) Displays QoS-related information for the active instance of the switch. |
| | all | (Optional) Displays QoS-related information for all instances of the switch. |
| | standby | (Optional) Displays QoS-related information for the standby instance of the switch. |
| | control-plane | (Optional) Displays QoS-related information for the control-plane. |
| | interface <i>interface-name</i> | (Optional) Displays QoS-related information for a specified interface. |
| | all | (Optional) Displays QoS-related information for all interfaces. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

Usage Guidelines The output of this command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support qos | redirect flash: filename**) in the local writable storage file system or remote file system.

The output of the **show tech-support qos** command displays a list of commands and their output. These commands differ based on the platform.

Examples

The following is sample output from the **show tech-support qos** command:

```
Device# show tech-support qos
```

```
.  
.
.
```

```
----- show platform software fed active qos policy target brief
-----
```

```
TCG summary for policy: system-cpp-policy
```

```

Output fields are self-explanatory.

trust device

To configure trust for supported devices connected to an interface, use the **trust device** command in interface configuration mode. Use the **no** form of this command to disable trust for the connected device.

```
trust device {cisco-phone | cts | ip-camera | media-player}
no trust device {cisco-phone | cts | ip-camera | media-player}
```

| Syntax Description | |
|---------------------|--|
| cisco-phone | Configures a Cisco IP phone |
| cts | Configures a Cisco TelePresence System |
| ip-camera | Configures an IP Video Surveillance Camera (IPVSC) |
| media-player | Configures a Cisco Digital Media Player (DMP) |

Command Default Trust disabled

Command Modes Interface configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **trust device** command on the following types of interfaces:

- **Auto**— auto-template interface
- **Capwap**—CAPWAP tunnel interface
- **GigabitEthernet**—Gigabit Ethernet IEEE 802
- **GroupVI**—Group virtual interface
- **Internal Interface**—Internal interface
- **Loopback**—Loopback interface
- **Null**—Null interface
- **Port-channel**—Ethernet Channel interface
- **TenGigabitEthernet--10-Gigabit Ethernet**
- **Tunnel**—Tunnel interface
- **Vlan**—Catalyst VLANs
- **range**—**interface range** command

Example

The following example configures trust for a Cisco IP phone in Interface GigabitEthernet 1/0/1:

```
Device(config)# interface gigabitethernet 1/0/1  
Device(config-if)# trust device cisco-phone
```

accept-lifetime

To set the time period during which the authentication key on a key chain is received as valid, use the **accept-lifetime** command in key chain key configuration mode. To revert to the default value, use the **no** form of this command.

```
accept-lifetime [ local ] start-time { infinite end-time | duration seconds }
no accept-lifetime
```

Syntax Description

| | |
|--------------------------------|--|
| local | Specifies the time in local timezone. |
| <i>start-time</i> | Beginning time that the key specified by the key command is valid to be received. The syntax can be either of the following: <i>hh : mm : ss month date year</i> <i>hh : mm : ss date month year</i> <ul style="list-style-type: none"> • <i>hh</i>: Hours • <i>mm</i>: Minutes • <i>ss</i>: Seconds • <i>month</i>: First three letters of the month • <i>date</i>: Date (1-31) • <i>year</i>: Year (four digits) <p>The default start time and the earliest acceptable date is January 1, 1993.</p> |
| infinite | Key is valid to be received from the <i>start-time</i> value on. |
| <i>end-time</i> | Key is valid to be received from the <i>start-time</i> value until the <i>end-time</i> value. The syntax is the same as that for the <i>start-time</i> value. The <i>end-time</i> value must be after the <i>start-time</i> value. The default end time is an infinite time period. |
| duration <i>seconds</i> | Length of time (in seconds) that the key is valid to be received. The range is from 1 to 2147483646. |

Command Default

The authentication key on a key chain is received as valid forever (the starting time is January 1, 1993, and the ending time is infinite).

Command Modes

Key chain key configuration (config-keychain-key)

Command History

| Release | Modification |
|-------------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Bengaluru 17.5.1 | The new range of the duration keyword is from 1 to 2147483646. |

Usage Guidelines

Only DRP Agent, Enhanced Interior Gateway Routing Protocol (EIGRP), and Routing Information Protocol (RIP) Version 2 use key chains.

Specify a *start-time* value and one of the following values: **infinite**, *end-time*, or **duration seconds**.

We recommend running Network Time Protocol (NTP) or some other time synchronization method if you assign a lifetime to a key.

If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key.

Examples

The following example configures a key chain named chain1. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and will be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and will be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# interface GigabitEthernet1/0/1
Device(config-if)# ip rip authentication key-chain chain1
Device(config-if)# ip rip authentication mode md5
Device(config-if)# exit
Device(config)# router rip
Device(config-router)# network 172.19.0.0
Device(config-router)# version 2
Device(config-router)# exit
Device(config)# key chain chain1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string key1
Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain)# key-string key2
Device(config-keychain)# accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device(config-keychain)# send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

The following example configures a key chain named chain1 for EIGRP address-family. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# router eigrp 10
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# af-interface ethernet0/0
Device(config-router-af-interface)# authentication key-chain trees
Device(config-router-af-interface)# authentication mode md5
Device(config-router-af-interface)# exit
Device(config-router-af)# exit
Device(config-router)# exit
Device(config)# key chain chain1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string key1
Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain-key)# key-string key2
```

```
Device(config-keychain-key) # accept-lifetime 14:30:00 Jan 25 1996 duration 7200  
Device(config-keychain-key) # send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

Related Commands

| Command | Description |
|------------------------------------|---|
| key | Identifies an authentication key on a key chain. |
| key chain | Defines an authentication key-chain needed to enable authentication for routing protocols. |
| key-string (authentication) | Specifies the authentication string for a key. |
| send-lifetime | Sets the time period during which an authentication key on a key chain is valid to be sent. |
| show key chain | Displays authentication key information. |

address-family ipv4 (EIGRP MTR)

To configure the Enhanced Interior Gateway Routing Protocol (EIGRP) for Multitopology Routing (MTR), use the **address-family ipv4** command in router configuration mode. To remove the address family from the EIGRP configuration, use the **no** form of this command.

```
address-family ipv4 [{unicast | multicast | vrf vrf-name}] autonomous-system as-number
no address-family ipv4 [{unicast | multicast | vrf vrf-name}] autonomous-system as-number
```

| Syntax Description | |
|------------------------------------|--|
| unicast | (Optional) Specifies the unicast subaddress family. |
| multicast | (Optional) Specifies the multicast subaddress family. |
| vrf vrf-name | (Optional) Specifies the name of the virtual routing and forwarding (VRF). |
| autonomous-system as-number | Specifies the autonomous system number. |

Command Default This command is disabled by default.

Command Modes Router configuration (config-router)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines The **address-family ipv4** command is used to enter router address family or subaddress family configuration mode to configure the exchange of address-family and subaddress-family prefixes.

Note If Enhanced Routing and Forwarding is not available, the **multicast** keyword is also not available.

Examples

The following example shows how to configure an IPv4 address family to associate with an MTR topology named VIDEO:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp mtr
Device(config-router)# address-family ipv4 autonomous-system 5
Device(config-router-af)# topology VIDEO tid 100
```

| Related Commands | Command | Description |
|------------------|---------------------|---|
| | router eigrp | Configures the EIGRP routing process. |
| | topology | Configures the EIGRP process to route IP traffic under the specified topology instance. |

address-family ipv6 (OSPF)

To enter the address family configuration mode for configuring routing sessions, such as Open Shortest Path First (OSPF), that uses the standard IPv6 address prefixes, use the **address-family ipv6** command in the router configuration mode. To disable the address family configuration mode, use the **no** form of this command.

```
address-family ipv6 [unicast ][{vrf vrf-name }]  
no address-family ipv6 [unicast ][{vrf vrf-name }]
```

Syntax Description

| | |
|-----------------|--|
| unicast | (Optional) Specifies the IPv6 unicast address prefixes. |
| vrf | (Optional) Specifies all the VPN routing and forwarding (VRF) instance tables or a specific VRF table for an IPv6 address. |
| <i>vrf-name</i> | (Optional) A specific VRF table for an IPv6 address. |

Command Default

IPv6 address prefixes are not enabled. Unicast address prefixes are the default when the IPv6 address prefixes are configured.

Command Modes

Router configuration (config-router)

Command History

| Release | Modification |
|-----------------------------|----------------|
| Cisco IOS XE Everest 16.6.1 | This command w |

Usage Guidelines

The **address-family ipv6** command places the router in address family configuration mode (prompt: config-router-af), from which you can configure routing sessions that use the standard IPv6 address prefixes.

Examples

The following example shows how to place the router in address family configuration mode:

```
Device> enable  
Device# configure terminal  
Device(config)# router ospfv3 1  
Device(config-router)# address-family ipv6 unicast  
Device(config-router-af)#
```

Related Commands

| Command | Description |
|----------------------|--|
| router ospfv3 | Enters OSPFv3 router configuration mode. |

address-family l2vpn

To enter address family configuration mode to configure a routing session using Layer 2 Virtual Private Network (VPN) endpoint provisioning address information, use the **address-family l2vpn** command in router configuration mode. To remove the Layer 2 VPN address family configuration from the running configuration, use the **no** form of this command.

```
address-family l2vpn [{evpn | vpls}]
no address-family l2vpn [{evpn | vpls}]
```

| | | |
|--|--|---|
| Syntax Description | evpn | (Optional) Specifies L2VPN Ethernet Virtual Private Network (EVPN) endpoint provisioning address information. |
| | vpls | (Optional) Specifies L2VPN Virtual Private LAN Service (VPLS) endpoint provisioning address information. |
| Command Default | No Layer 2 VPN endpoint provisioning support is enabled. | |
| Command Modes | Router configuration (config-router) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Usage Guidelines | The address-family l2vpn command places the device in address family configuration mode (prompt: config-router-af), from which you can configure routing sessions that support Layer 2 VPN endpoint provisioning. | |
| | BGP support for the Layer 2 VPN address family introduces a BGP-based autodiscovery mechanism to distribute Layer 2 VPN endpoint provisioning information. BGP uses a separate Layer 2 VPN routing information base (RIB) to store endpoint provisioning information, which is updated each time any Layer 2 virtual forwarding instance (VFI) is configured. Prefix and path information is stored in the Layer 2 VPN database, allowing BGP to make best-path decisions. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, the endpoint information is used to set up a pseudowire mesh to support Layer 2 VPN-based services. | |
| | The BGP autodiscovery mechanism facilitates the setting up of Layer 2 VPN services, which are an integral part of the Cisco IOS Virtual Private LAN Service (VPLS) feature. VPLS enables flexibility in deploying services by connecting geographically dispersed sites as a large LAN over high-speed Ethernet in a robust and scalable IP MPLS network. | |
| The multiprotocol capability for address family Layer 2 VPN EVPN is advertised when the Address Family Identifier (AFI) is enabled under the internal BGP (iBGP) and external BGP (eBGP) neighbors for both IPv4 and IPv6 neighbors. | | |

Note Routing information for address family IPv4 is advertised by default for each BGP routing session configured with the **neighbor remote-as** command unless you configure the **no bgp default ipv4-unicast** command before configuring the **neighbor remote-as** command.

Examples

In this example, two provider edge (PE) devices are configured with VPLS endpoint provisioning information that includes Layer 2 VFI, VPN, and VPLS IDs. BGP neighbors are configured and activated under Layer 2 VPN address family to ensure that the VPLS endpoint provisioning information is saved to a separate Layer 2 VPN RIB and then distributed to other BGP peers in BGP update messages. When the endpoint information is received by the BGP peers, a pseudowire mesh is set up to support Layer 2 VPN-based services.

Device A

```
Device> enable
Device# configure terminal
Device(config)# l2 vfi customerA autodiscovery
Device(config-vfi)# vpn id 100
Device(config-vfi)# vpls-id 45000:100
Device(config-vfi)# exit
Device(config)# l2 vfi customerB autodiscovery
Device(config-vfi)# vpn id 200
Device(config-vfi)# vpls-id 45000:200
Device(config-vfi)# exit
Device(config)# router bgp 45000
Device(config-router)# no bgp default ipv4-unicast
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# neighbor 172.16.1.2 remote-as 45000
Device(config-router)# neighbor 172.21.1.2 remote-as 45000
Device(config-router)# address-family l2vpn vpls
Device(config-router-af)# neighbor 172.16.1.2 activate
Device(config-router-af)# neighbor 172.16.1.2 send-community extended
Device(config-router-af)# neighbor 172.21.1.2 activate
Device(config-router-af)# neighbor 172.21.1.2 send-community extended
Device(config-router-af)# end
```

Device B

```
Device> enable
Device# configure terminal
Device(config)# l2 vfi customerA autodiscovery
Device(config-vfi)# vpn id 100
Device(config-vfi)# vpls-id 45000:100
Device(config-vfi)# exit
Device(config)# l2 vfi customerB autodiscovery
Device(config-vfi)# vpn id 200
Device(config-vfi)# vpls-id 45000:200
Device(config-vfi)# exit
Device(config)# router bgp 45000
Device(config-router)# no bgp default ipv4-unicast
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# neighbor 172.16.1.1 remote-as 45000
Device(config-router)# neighbor 172.22.1.1 remote-as 45000
```

```
Device(config-router)# address-family l2vpn vpls
Device(config-router-af)# neighbor 172.16.1.1 activate
Device(config-router-af)# neighbor 172.16.1.1 send-community extended
Device(config-router-af)# neighbor 172.22.1.1 activate
Device(config-router-af)# neighbor 172.22.1.1 send-community extended
Device(config-router-af)# end
```

Related Commands

| Command | Description |
|--------------------------|--|
| neighbor activate | Enables the exchange of information with a BGP neighboring router. |

aggregate-address

To create an aggregate entry in a Border Gateway Protocol (BGP) database, use the **aggregate-address** command in address family or router configuration mode. To disable this function, use the **no** form of this command.

```
aggregate-address address mask [as-set] [as-confed-set] [summary-only] [suppress-map map-name]
[advertise-map map-name] [attribute-map map-name]
no aggregate-address address mask [as-set] [as-confed-set] [summary-only] [suppress-map
map-name] [advertise-map map-name] [attribute-map map-name]
```

Syntax Description

| | |
|--------------------------------------|---|
| <i>address</i> | Aggregate address. |
| <i>mask</i> | Aggregate mask. |
| as-set | (Optional) Generates autonomous system set path information. |
| as-confed-set | (Optional) Generates autonomous confederation set path information. |
| summary-only | (Optional) Filters all more-specific routes from updates. |
| suppress-map <i>map-name</i> | (Optional) Specifies the name of the route map used to select the routes to be suppressed. |
| advertise-map <i>map-name</i> | (Optional) Specifies the name of the route map used to select the routes to create AS_SET origin communities. |
| attribute-map <i>map-name</i> | (Optional) Specifies the name of the route map used to set the attribute of the aggregate route. |

Command Default

The atomic aggregate attribute is set automatically when an aggregate route is created with this command unless the **as-set** keyword is specified.

Command Modes

Address family configuration (config-router-af)
Router configuration (config-router)

Command History

Table 139:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

You can implement aggregate routing in BGP and Multiprotocol BGP (mBGP) either by redistributing an aggregate route into BGP or mBGP, or by using the conditional aggregate routing feature.

Using the **aggregate-address** command with no keywords will create an aggregate entry in the BGP or mBGP routing table if any more-specific BGP or mBGP routes are available that fall within the specified range. (A longer prefix that matches the aggregate must exist in the Routing Information Base (RIB).) The aggregate route will be advertised as coming from your autonomous system and will have the atomic aggregate attribute

set to show that information might be missing. (By default, the atomic aggregate attribute is set unless you specify the **as-set** keyword.)

Using the **as-set** keyword creates an aggregate entry using the same rules that the command follows without this keyword, but the path advertised for this route will be an AS_SET consisting of all elements contained in all paths that are being summarized. Do not use this form of the **aggregate-address** command when aggregating many paths, because this route must be continually withdrawn and updated as autonomous system path reachability information for the summarized routes changes.

Using the **as-confed-set** keyword creates an aggregate entry using the same rules that the command follows without this keyword. This keyword performs the same function as the **as-set** keyword, except that it generates autonomous confed set path information.

Using the **summary-only** keyword not only creates the aggregate route (for example, 192.*.*.*) but also suppresses advertisements of more-specific routes to all neighbors. If you want to suppress only advertisements to certain neighbors, you may use the **neighbor distribute-list** command, with caution. If a more-specific route leaks out, all BGP or mBGP routers will prefer that route over the less-specific aggregate you are generating (using longest-match routing).

Using the **suppress-map** keyword creates the aggregate route but suppresses advertisement of specified routes. You can use the **match** clauses of route maps to selectively suppress some more-specific routes of the aggregate and leave others unsuppressed. IP access lists and autonomous system path access lists match clauses are supported.

Using the **advertise-map** keyword selects specific routes that will be used to build different components of the aggregate route, such as AS_SET or community. This form of the **aggregate-address** command is useful when the components of an aggregate are in separate autonomous systems and you want to create an aggregate with AS_SET, and advertise it back to some of the same autonomous systems. You must remember to omit the specific autonomous system numbers from the AS_SET to prevent the aggregate from being dropped by the BGP loop detection mechanism at the receiving router. IP access lists and autonomous system path access lists **match** clauses are supported.

Using the **attribute-map** keyword allows attributes of the aggregate route to be changed. This form of the **aggregate-address** command is useful when one of the routes forming the AS_SET is configured with an attribute such as the community no-export attribute, which would prevent the aggregate route from being exported. An attribute map route map can be created to change the aggregate attributes.

AS-Set Example

In the following example, an aggregate BGP address is created in router configuration mode. The path advertised for this route will be an AS_SET consisting of all elements contained in all paths that are being summarized.

```
Device(config)#router bgp 50000
Device(config-router)#aggregate-address 10.0.0.0 255.0.0.0 as-set
```

Summary-Only Example

In the following example, an aggregate BGP address is created in address family configuration mode and applied to the multicast database under the IP Version 4 address family. Because the **summary-only** keyword is configured, more-specific routes are filtered from updates.

```
Device(config)#router bgp 50000
```

```
Device(config-router)#address-family ipv4 multicast
Device(config-router-af)#aggregate-address 10.0.0.0 255.0.0.0 summary-only
```

Conditional Aggregation Example

In the following example, a route map called MAP-ONE is created to match on an AS-path access list. The path advertised for this route will be an AS_SET consisting of elements contained in paths that are matched in the route map.

```
Device(config)#ip as-path access-list 1 deny ^1234_
Device(config)#ip as-path access-list 1 permit .*
Device(config)#!
Device(config)#route-map MAP-ONE
Device(config-route-map)#match ip as-path 1
Device(config-route-map)#exit
Device(config)#router bgp 50000
Device(config-router)#address-family ipv4
Device(config-router-af)#aggregate-address 10.0.0.0 255.0.0.0 as-set advertise-map
MAP-ONE
Router(config-router-af)#end
```

Related Commands

| Command | Description |
|----------------------------------|---|
| address-family ipv4 (BGP) | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes. |
| ip as-path access-list | Defines a BGP autonomous system path access list. |
| match ip address | Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, and performs policy routing on packets. |
| neighbor distribute-list | Distributes BGP neighbor information in an access list. |
| route-map (IP) | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing. |

area nssa

To configure a not-so-stubby area (NSSA), use the **area nssa** command in router address family topology or router configuration mode. To remove the NSSA distinction from the area, use the **no** form of this command.

```
area nssa command area area-id nssa [no-redistribution] [default-information-originate [metric]
[metric-type]] [no-summary] [nssa-only]
no area area-id nssa [no-redistribution] [default-information-originate [metric] [metric-type]]
[no-summary] [nssa-only]
```

Syntax Description

| | |
|--------------------------------------|---|
| <i>area-id</i> | Identifier for the stub area or NSSA. The identifier can be specified as either a decimal value or an IP address. |
| no-redistribution | (Optional) Used when the router is an NSSA Area Border Router (ABR) and you want the redistribute command to import routes only into the normal areas, but not into the NSSA area. |
| default-information-originate | (Optional) Used to generate a Type 7 default into the NSSA area. This keyword takes effect only on the NSSA ABR or the NSSA Autonomous System Boundary Router (ASBR). |
| metric | (Optional) Specifies the OSPF default metric. |
| metric-type | (Optional) Specifies the OSPF metric type for default routes. |
| no-summary | (Optional) Allows an area to be an NSSA but not have summary routes injected into it. |
| nssa-only | (Optional) Limits the default advertisement to this NSSA area by setting the propagate (P) bit in the type-7 LSA to zero. |

Command Default

No NSSA area is defined.

Command Modes

Router address family topology configuration (config-router-af-topology) Router configuration (config-router)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

To remove the specified area from the software configuration, use the **no area *area-id*** command (with no other keywords). That is, the **no area *area-id*** command removes all area options, including **area authentication**, **area default-cost**, **area nssa**, **area range**, **area stub**, and **area virtual-link**.

Release 12.2(33)SRB

If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the **area nssa** command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.

Examples

The following example makes area 1 an NSSA area:

```
router ospf 1
 redistribute rip subnets
 network 172.19.92.0 0.0.0.255 area 1
 area 1 nssa
```

Related Commands

| Command | Description |
|---------------------|---|
| redistribute | Redistributes routes from one routing domain into another routing domain. |

area virtual-link

To define an Open Shortest Path First (OSPF) virtual link, use the **area virtual-link** command in router address family topology, router configuration, or address family configuration mode. To remove a virtual link, use the **no** form of this command.

```
area area-id virtual-link router-id authentication key-chain chain-name [hello-interval seconds]
[retransmit-interval seconds] [transmit-delay seconds] [dead-interval seconds] [ttl-security hops
hop-count]
```

```
no area area-id virtual-link router-id authentication key-chain chain-name
```

Syntax Description

Table 140:

| | |
|---|--|
| <i>area-id</i> | Area ID assigned to the virtual link. This can be either a decimal value or a valid IPv6 prefix. There is no default. |
| <i>router-id</i> | Router ID associated with the virtual link neighbor. The router ID appears in the show ip ospf or show ipv6 display command. There is no default. |
| authentication | Enables virtual link authentication. |
| key-chain | Configures a key-chain for cryptographic authentication keys. |
| <i>chain-name</i> | Name of the authentication key that is valid. |
| hello-interval <i>seconds</i> | (Optional) Specifies the time (in seconds) between the hello packets that the Cisco IOS software sends on an interface. The hello interval is an unsigned integer value to be advertised in the hello packets. The value must be the same for all routers and access servers attached to a common network. The range is from 1 to 8192. The default is 10. |
| retransmit-interval <i>seconds</i> | (Optional) Specifies the time (in seconds) between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay. The range is from 1 to 8192. The default is 5. |
| transmit-delay <i>seconds</i> | (Optional) Specifies the estimated time (in seconds) required to send a link-state update packet on the interface. The integer value that must be greater than zero. LSAs in the update packet have their age incremented by this amount before transmission. The range is from 1 to 8192. The default value is 1. |

| | |
|---|--|
| dead-interval <i>seconds</i> | (Optional) Specifies the time (in seconds) that hello packets are not seen before a neighbor declares the router down. The dead interval is an unsigned integer value. The default is four times the hello interval, or 40 seconds. As with the hello interval, this value must be the same for all routers and access servers attached to a common network. |
| ttl-security hops <i>hop-count</i> | (Optional) Configures Time-to-Live (TTL) security on a virtual link. The <i>hop-count</i> argument range is from 1 to 254. |

Command Default No OSPF virtual link is defined.

Command Modes Router address family topology configuration (config-router-af-topology)
Router configuration (config-router)
Address family configuration (config-router-af)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines In OSPF, all areas must be connected to a backbone area. A lost connection to the backbone can be repaired by establishing a virtual link.

The shorter the hello interval, the faster topological changes will be detected, but more routing traffic will ensue. The setting of the retransmit interval should be conservative, or needless retransmissions will result. The value should be larger for serial lines and virtual links.

You should choose a transmit delay value that considers the transmission and propagation delays for the interface.

To configure a virtual link in OSPF for IPv6, you must use a router ID instead of an address. In OSPF for IPv6, the virtual link takes the router ID rather than the IPv6 prefix of the remote router.

Use the **ttl-security hops** *hop-count* keywords and argument to enable checking of TTL values on OSPF packets from neighbors or to set TTL values sent to neighbors. This feature adds an extra layer of protection to OSPF.

Note In order for a virtual link to be properly configured, each virtual link neighbor must include the transit area ID and the corresponding virtual link neighbor router ID. To display the router ID, use the **show ip ospf** or the **show ipv6 ospf** command in privileged EXEC mode.

Note To remove the specified area from the software configuration, use the **no area** *area-id* command (with no other keywords). That is, the **no area** *area-id* command removes all area options, such as **area default-cost**, **area nssa**, **area range**, **area stub**, and **area virtual-link**.

Release 12.2(33)SRB

If you plan to configure the Multitopology Routing (MTR) feature, you need to enter the **area virtual-link** command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.

Examples

The following example establishes a virtual link with default values for all optional parameters:

```
Device(config)# ipv6 router ospf 1
Device(config)# log-adjacency-changes
Device(config)# area 1 virtual-link 192.168.255.1
```

The following example establishes a virtual link in OSPF for IPv6:

```
Device(config)# ipv6 router ospf 1
Device(config)# log-adjacency-changes
Device(config)# area 1 virtual-link 192.168.255.1 hello-interval 5
```

The following example shows how to configure TTL security for a virtual link in OSPFv3 for IPv6:

```
Device(config)# router ospfv3 1
Device(config-router)# address-family ipv6 unicast vrf vrf1
Device(config-router-af)# area 1 virtual-link 10.1.1.1 ttl-security hops 10
```

The following example shows how to configure the authentication using a key chain for virtual-links:

```
Device(config)# area 1 virtual-link 192.168.255.1 authentication key-chain ospf-chain-1
```

Related Commands

| Command | Description |
|--------------------------|--|
| area | Configures OSPFv3 area parameters. |
| show ip ospf | Enables the display of general information about OSPF routing processes. |
| show ipv6 ospf | Enables the display of general information about OSPF routing processes. |
| ttl-security hops | Enables checking of TTL values on OSPF packets from neighbors or setting TTL values sent to neighbors. |

auto-summary (BGP)

To configure automatic summarization of subnet routes into network-level routes, use the **auto-summary** command in address family or router configuration mode. To disable automatic summarization and send subprefix routing information across classful network boundaries, use the **no** form of this command.

auto-summary
no auto-summary

Syntax Description This command has no arguments or keywords.

Command Default Automatic summarization is disabled by default (the software sends subprefix routing information across classful network boundaries).

Command Modes Address family configuration (config-router-af)
 Router configuration (config-router)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines BGP automatically summarizes routes to classful network boundaries when this command is enabled. Route summarization is used to reduce the amount of routing information in routing tables. Automatic summarization applies to connected, static, and redistributed routes.

Note The MPLS VPN Per VRF Label feature does not support auto-summary.

By default, automatic summarization is disabled and BGP accepts subnets redistributed from an Interior Gateway Protocol (IGP). To block subnets and create summary subprefixes to the classful network boundary when crossing classful network boundaries, use the **auto-summary** command.

To advertise and carry subnet routes in BGP when automatic summarization is enabled, use an explicit **network** command to advertise the subnet. The **auto-summary** command does not apply to routes injected into BGP via the **network** command or through iBGP or eBGP.

Why auto-summary for BGP Is Disabled By Default

When **auto-summary** is enabled, routes injected into BGP via redistribution are summarized on a classful boundary. Remember that a 32-bit IP address consists of a network address and a host address. The subnet mask determines the number of bits used for the network address and the number of bits used for the host address. The IP address classes have a natural or standard subnet mask, as shown in the table below.

Table 141: IP Address Classes

| Class | Address Range | Standard Mask |
|-------|--------------------------|--------------------|
| A | 1.0.0.0 to 126.0.0.0 | 255.0.0.0 or /8 |
| B | 128.1.0.0 to 191.254.0.0 | 255.255.0.0 or /16 |

| Class | Address Range | Standard Mask |
|-------|----------------------------|----------------------|
| C | 192.0.1.0 to 223.255.254.0 | 255.255.255.0 or /24 |

Reserved addresses include 128.0.0.0, 191.255.0.0, 192.0.0.0, and 223.255.255.0.

When using the standard subnet mask, Class A addresses have one octet for the network, Class B addresses have two octets for the network, and Class C addresses have three octets for the network.

Consider the Class B address 156.26.32.1 with a 24-bit subnet mask, for example. The 24-bit subnet mask selects three octets, 156.26.32, for the network. The last octet is the host address. If the network 156.26.32.1/24 is learned via an IGP and is then redistributed into BGP, if **auto-summary** were enabled, the network would be automatically summarized to the natural mask for a Class B network. The network that BGP would advertise is 156.26.0.0/16. BGP would be advertising that it can reach the entire Class B address space from 156.26.0.0 to 156.26.255.255. If the only network that can be reached via the BGP router is 156.26.32.0/24, BGP would be advertising 254 networks that cannot be reached via this router. This is why the **auto-summary (BGP)** command is disabled by default.

Examples

In the following example, automatic summarization is enabled for IPv4 address family prefixes:

```
Device(config)#router bgp 50000
Device(config-router)#address-family ipv4 unicast
Device(config-router-af)#auto-summary
Device(config-router-af)#network 7.7.7.7 255.255.255.255
```

In the example, there are different subnets, such as 7.7.7.6 and 7.7.7.7 on Loopback interface 6 and Loopback interface 7, respectively. Both **auto-summary** and a **network** command are configured.

```
Device#show ip interface brief
Interface          IP-Address      OK? Method Status        Protocol
Ethernet0/0        100.0.1.7       YES NVRAM    up            up
Ethernet0/1        unassigned      YES NVRAM    administratively down down
Ethernet0/2        unassigned      YES NVRAM    administratively down down
Ethernet0/3        unassigned      YES NVRAM    administratively down down
Ethernet1/0        108.7.9.7       YES NVRAM    up            up
Ethernet1/1        unassigned      YES NVRAM    administratively down down
Ethernet1/2        unassigned      YES NVRAM    administratively down down
Ethernet1/3        unassigned      YES NVRAM    administratively down down
Loopback6          7.7.7.6         YES NVRAM    up            up
Loopback7          7.7.7.7         YES NVRAM    up            up
```

Note that in the output below, because of the **auto-summary** command, the BGP routing table displays the summarized route 7.0.0.0 instead of 7.7.7.6. The 7.7.7.7/32 network is displayed because it was configured with the **network** command, which is not affected by the **auto-summary** command.

```

Related Commands

| Command | Description |
|--|--|
| address-family ipv4 (BGP) | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes. |
| address-family vpnv4 | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| network (BGP and multiprotocol BGP) | Specifies the networks to be advertised by BGP and multiprotocol BGP. |

authentication (BFD)

To configure authentication in a Bidirectional Forwarding Detection (BFD) template for single hop sessions, use the **authentication** command in BFD configuration mode. To disable authentication in BFD template for single-hop sessions, use the **no** form of this command

authentication *authentication-type* **keychain** *keychain-name*
no authentication *authentication-type* **keychain** *keychain-name*

Syntax Description

authentication-type Authentication type. Valid values are md5, meticulous-md5, meticulous-sha 1, and sha-1.

keychain *keychain-name* Configures an authentication key chain with the specified name. The maximum number of characters allowed in the name is 32.

Command Default

Authentication in BFD template for single hop sessions is not enabled.

Command Modes

BFD configuration (config-bfd)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

You can configure authentication in single hop templates. We recommend that you configure authentication to enhance security. Authentication must be configured on each BFD source-destination pair, and authentication parameters must match on both devices.

Examples

The following example shows how to configure authentication for the template1 BFD single-hop template:

```
Device>enable
Device#configuration terminal
Device(config)#bfd-template single-hop template1
Device(config-bfd)#authentication sha-1 keychain bfd-singlehop
```

bfd

To set the baseline Bidirectional Forwarding Detection (BFD) session parameters on an interface, use the **bfd** interface configuration mode. To remove the baseline BFD session parameters, use the **no** form of this command

```
bfd interval milliseconds min_rx milliseconds multiplier multiplier-value
no bfd interval milliseconds min_rx milliseconds multiplier multiplier-value
```

| Syntax Description | | |
|---|--|--|
| interval <i>milliseconds</i> | | Specifies the rate, in milliseconds, at which BFD control packets will be sent to BFD peers. The valid range for the milliseconds argument is from 50 to 9999. |
| min_rx <i>milliseconds</i> | | Specifies the rate, in milliseconds, at which BFD control packets will be expected to be received from BFD peers. The valid range for the milliseconds argument is from 50 to 9999. |
| multiplier <i>multiplier-value</i> | | Specifies the number of consecutive BFD control packets that must be missed from a BFD peer before BFD declares that the peer is unavailable and the Layer 3 BFD peer is informed of the failure. The valid range for the multiplier-value argument is from 3 to 50. |

Command Default No baseline BFD session parameters are set.

Command Modes Interface configuration (config-if)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **bfd** command can be configured on SVI, Ethernet and port-channel interfaces. If BFD runs on a port channel interface, BFD has a timer value restriction of $750 * 3$ milliseconds.

The **bfd interval** configuration is not removed when:

- an IPv4 address is removed from an interface
- an IPv6 address is removed from an interface
- IPv6 is disabled from an interface
- an interface is shutdown
- IPv4 CEF is disabled globally or locally on an interface
- IPv6 CEF is disabled globally or locally on an interface

The **bfd interval** configuration is removed when the subinterface on which its is configured is removed.

Note If we configure `bfd interval` command in interface config mode, then `bfd echo` mode is enabled by default. We need to enable either `no ip redirect` (if BFD echo is needed) or `no bfd echo` in interface config mode.

Before using BFD echo mode, you must disable sending Internet Control Message Protocol (ICMP) redirect messages by entering the `no ip redirect` command, in order to avoid high CPU utilization.

Examples

The following example shows the BFD session parameters set for Gigabit Ethernet 1/0/3:

```
Device>enable
Device#configuration terminal
Device(config)#interface gigabitethernet 1/0/3
Device(config-if)#bfd interval 100 min_rx 100 multiplier 3
```

bfd all-interfaces

To enable Bidirectional Forwarding Detection (BFD) for all interfaces participating in the routing process, use the **bfd all-interfaces** command in router configuration or address family interface configuration mode. To disable BFD for all neighbors on a single interface, use the **no** form of this command

bfd all-interfaces
no bfd all-interfaces

Syntax Description

This command has no arguments or keywords.

Command Default

BFD is disabled on the interfaces participating in the routing process.

Command Modes

Router configuration (config-router)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

To enable BFD for all interfaces, enter the **bfd all-interfaces** command in router configuration mode

Examples

The following example shows how to enable BFD for all Enhanced Interior Gateway Routing Protocol (EIGRP) neighbors:

```
Device>enable
Device#configuration terminal
Device(config)#router eigrp 123
Device(config-router)#bfd all-interfaces
Device(config-router)#end
```

The following example shows how to enable BFD for all Intermediate System-to-Intermediate System (IS-IS) neighbors:

```
Device> enable
Device#configuration terminal
Device(config)#router isis tag1
Device(config-router)#bfd all-interfaces
Device(config-router)#end
```

bfd check-ctrl-plane-failure

To enable Bidirectional Forwarding Detection (BFD) control plane failure checking for the Intermediate System-to-Intermediate System (IS-IS) routing protocol, use the **bfd check-control-plane-failure** command in router configuration mode. To disable control plane failure detection, use the **no** form of this command

bfd check-ctrl-plane-failure
no bfd check-ctrl-plane-failure

Syntax Description This command has no arguments or keywords.

Command Default BFD control plane failure checking is disabled.

Command Modes Router configuration (config-router)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **bfd check-ctrl-plane-failure** command can be configured for an IS-IS routing process only. The command is not supported on other protocols.

When a switch restarts, a false BFD session failure can occur, where neighboring routers behave as if a true forwarding failure has occurred. However, if the **bfd check-ctrl-plane-failure** command is enabled on a switch, the router can ignore control plane related BFD session failures. We recommend that you add this command to the configuration of all neighboring routers just prior to a planned router restart, and that you remove the command from all neighboring routers when the restart is complete.

Examples

The following example enables BFD control plane failure checking for the IS-IS routing protocol:

```
Device>enable
Device#configuration terminal
Device(config)#router isis
Device(config-router)#bfd check-ctrl-plane-failure
Device(config-router)#end
```

bfd echo

To enable Bidirectional Forwarding Detection (BFD) echo mode, use the **bfd echo** command in interface configuration mode. To disable BFD echo mode, use the **no** form of this command

bfd echo
no bfd echo

Syntax Description

This command has no arguments or keywords.

Command Default

BFD echo mode is enabled by default if BFD is configured using **bfd interval** command in interface configuration mode.

Command Modes

Interface configuration (config-if)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Echo mode is enabled by default. Entering the **no bfd echo** command without any keywords turns off the sending of echo packets and signifies that the switch is unwilling to forward echo packets received from BFD neighbor switches.

When echo mode is enabled, the desired minimum echo transmit interval and required minimum transmit interval values are taken from the **bfd interval milliseconds min_rx milliseconds** parameters, respectively.

Note Before using BFD echo mode, you must disable sending Internet Control Message Protocol (ICMP) redirect messages by entering the **no ip redirects** command, in order to avoid high CPU utilization.

Examples

The following example configures echo mode between BFD neighbors:

```
Device>enable
Device#configuration terminal
Device(config)#interface GigabitEthernet 1/0/3
Device(config-if)#bfd echo
```

The following output from the **show bfd neighbors details** command shows that the BFD session neighbor is up and using BFD echo mode. The relevant command output is shown in bold in the output.

```
Device#show bfd neighbors details
OurAddr      NeighAddr  LD/RD  RH/RS  Holdown(mult)  State Int
172.16.1.2   172.16.1.1  1/6    Up      0 (3 )         Up   Fa0/1
Session state is UP and using echo function with 100 ms interval.
Local Diag: 0, Demand mode: 0, Poll bit: 0

Rx Count: 341, Rx Interval (ms) min/max/avg: 1/1008/882 last: 364 ms ago
Tx Count: 339, Tx Interval (ms) min/max/avg: 1/1016/886 last: 632 ms ago
Registered protocols: EIGRP
```

```
Uptime: 00:05:00
Last packet: Version: 1          - Diagnostic: 0
              State bit: Up      - Demand bit: 0
              Poll bit: 0        - Final bit: 0
              Multiplier: 3      - Length: 24
              My Discr.: 6       - Your Discr.: 1
              Min tx interval: 1000000 - Min rx interval: 1000000
              Min Echo interval: 50000
```

bfd slow-timers

To configure the Bidirectional Forwarding Detection (BFD) slow timers value, use the **bfd slow-timers** command in interface configuration mode. To change the slow timers used by BFD, use the **no** form of this command

```
bfd slow-timers [milliseconds]  
no bfd slow-timers
```

Command Default The BFD slow timer value is 1000 milliseconds

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example shows how to configure the BFD slow timers value to 14,000 milliseconds:

```
Device(config)#bfd slow-timers 14000
```

The following output from the show bfd neighbors details command shows that the BFD slow timers value of 14,000 milliseconds has been implemented. The values for the MinTxInt and MinRxInt will correspond to the configured value for the BFD slow timers. The relevant command output is shown in bold.

```
Device#show bfd neighbors details  
OurAddr      NeighAddr  LD/RD  RH/RS  Holdown(mult)  State  Int  
172.16.1.2   172.16.1.1  1/6    Up     0 (3 )         Up     Fa0/1  
Session state is UP and using echo function with 100 ms interval.  
Local Diag: 0, Demand mode: 0, Poll bit: 0  
MinTxInt: 14000, MinRxInt: 14000, Multiplier: 3  
Received MinRxInt: 1000000, Received Multiplier: 3  
Holdown (hits): 3600(0), Hello (hits): 1200(337)  
Rx Count: 341, Rx Interval (ms) min/max/avg: 1/1008/882 last: 364 ms ago  
Tx Count: 339, Tx Interval (ms) min/max/avg: 1/1016/886 last: 632 ms ago  
Registered protocols: EIGRP  
Uptime: 00:05:00  
Last packet: Version: 1           - Diagnostic: 0  
                State bit: Up       - Demand bit: 0  
                Poll bit: 0         - Final bit: 0  
                Multiplier: 3       - Length: 24  
                My Discr.: 6        - Your Discr.: 1  
                Min tx interval: 1000000 - Min rx interval: 1000000  
                Min Echo interval: 50000
```

**Note**

-
- If the BFD session is down, then the BFD control packets will be sent with the slow timer interval.
 - If the BFD session is up, then if echo is enabled, then BFD control packets will be sent in negotiated slow timer interval and echo packets will be sent in negotiated configured BFD interval. If echo is not enabled, then BFD control packets will be sent in negotiated configured interval.
-

bfd template

To create a Bidirectional Forwarding Detection (BFD) template and to enter BFD configuration mode, use the **bfd-template** command in global configuration mode. To remove a BFD template, use the **no** form of this command

bfd template *template-name*

no bfd template *template-name*

Command Default A BFD template is not bound to an interface.

Command Modes Interface configuration (config-if)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Even if you have not created the template by using the **bfd-template** command, you can configure the name of the template under an interface, but the template is considered invalid until you define the template. You do not have to reconfigure the template name again. It becomes valid automatically.

Examples

```
Device> enable
Device#configuration terminal
Device(config)#interface GigabitEthernet 1/3/0
Device(config-if)#bfd template templatel
```

bfd-template single-hop

To bind a single hop Bidirectional Forwarding Detection (BFD) template to an interface, use the **bfd template** command in interface configuration mode. To unbind single-hop BFD template from an interface, use the **no** form of this command

```
bfd-template single-hop template-name
no bfd-template single-hop template-name
```

| Syntax Description | single-hop Creates the single-hop BFD template. <i>template-name</i> Template name. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | A BFD template does not exist. | | | | |
| Command Modes | Global configuration (config) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines The **bfd-template** command allows you to create a BFD template and places the device in BFD configuration mode. The template can be used to specify a set of BFD interval values. BFD interval values specified as part of the BFD template are not specific to a single interface.

Examples

The following example shows how to create a BFD template and specify BFD interval values:

```
Device>enable
Device#configuration terminal
Device(config)#bfd-template single-hop node1
Device(bfd-config)#interval min-tx 100 min-rx 100 multiplier 3
Device(bfd-config)#echo
```

The following example shows how to create a BFD single-hop template and configure BFD interval values and an authentication key chain:

```
Device> enable
Device#configuration terminal
Device(config)#bfd-template single-hop templatel
Device(bfd-config)#interval min-tx 200 min-rx 200 multiplier 3
Device(bfd-config)#authentication keyed-sha-1 keychain bfd_singlehop
```

Note BFD echo is not enabled by default in the **bfd-template** configuration. This needs to be configured explicitly.

bgp graceful-restart

To enable the Border Gateway Protocol (BGP) graceful restart capability globally for all BGP neighbors, use the **bgp graceful-restart** command in address family or in router configuration mode. To disable the BGP graceful restart capability globally for all BGP neighbors, use the **no** form of this command.

bgp graceful-restart [{**extended** | **restart-time** *seconds* | **stalepath-time** *seconds*}] [**all**]
no bgp graceful-restart

Syntax Description

| | |
|--------------------------------------|---|
| extended | (Optional) Enables BGP graceful restart extension. |
| restart-time <i>seconds</i> | (Optional) Sets the maximum time period that the local router will wait for a graceful-restart-capable neighbor to return to normal operation after a restart event occurs. The default value for this argument is 120 seconds. The configurable range of values is from 1 to 3600 seconds. |
| stalepath-time <i>seconds</i> | (Optional) Sets the maximum time period that the local router will hold stale paths for a restarting peer. All stale paths are deleted after this timer expires. The default value for this argument is 360 seconds. The configurable range of values is from 1 to 3600 seconds. |
| all | (Optional) Enables BGP graceful restart capability for all address family modes. |

Command Default

The following default values are used when this command is entered without any keywords or arguments:

restart-time : 120 seconds **stalepath-time**: 360 seconds

Note Changing the restart and stalepath timer values is not required to enable the BGP graceful restart capability. The default values are optimal for most network deployments, and these values should be adjusted only by an experienced network operator.

Command Modes

Address-family configuration (config-router-af)

Router configuration (config-router)

Command History

Table 142:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **bgp graceful-restart** command is used to enable or disable the graceful restart capability globally for all BGP neighbors in a BGP network. The graceful restart capability is negotiated between nonstop forwarding (NSF)-capable and NSF-aware peers in OPEN messages during session establishment. If the graceful restart

capability is enabled after a BGP session has been established, the session will need to be restarted with a hard reset.

The graceful restart capability is supported by NSF-capable and NSF-aware routers. A router that is NSF-capable can perform a stateful switchover (SSO) operation (graceful restart) and can assist restarting peers by holding routing table information during the SSO operation. A router that is NSF-aware functions like a router that is NSF-capable but cannot perform an SSO operation.

The BGP graceful restart capability is enabled by default when a supporting version of Cisco IOS software is installed. The default timer values for this feature are optimal for most network deployments. We recommend that they are adjusted only by experienced network operators. When adjusting the timer values, the restart timer should not be set to a value greater than the hold time that is carried in the OPEN message. If consecutive restart operations occur, routes (from a restarting router) that were previously marked as stale will be deleted.

Note Changing the restart and stalepath timer values is not required to enable the BGP graceful restart capability. The default values are optimal for most network deployments, and these values should be adjusted only by an experienced network operator.

Examples

In the following example, the BGP graceful restart capability is enabled:

```
Device#configure terminal
Device(config)#router bgp 65000
Device(config-router)#bgp graceful-restart
```

In the following example, the restart timer is set to 130 seconds:

```
Device#configure terminal
Device(config)#router bgp 65000
Device(config-router)#bgp graceful-restart restart-time 130
```

In the following example, the stalepath timer is set to 350 seconds:

```
Device#configure terminal
Device(config)#router bgp 65000
Device(config-router)#bgp graceful-restart stalepath-time 350
```

In the following example, the **extended** keyword is used:

```
Device#configure terminal
Device(config)#router bgp 65000
Device(config-router)#bgp graceful-restart extended
```

Related Commands

Table 143:

| Command | Description |
|------------------------------|--|
| show ip bgp | Displays entries in the BGP routing table. |
| show ip bgp neighbors | Displays information about the TCP and BGP connections to neighbors. |

clear proximity ip bgp

To reset Border Gateway Protocol (BGP) connections using hard or soft reconfiguration, use the **clear proximity ip bgp** command in privileged EXEC mode.

```
clear proximity ip bgp [* | all autonomous-system-number neighbor-address | peer-group group-name]
[ {in [prefix-filter] | out | slow | soft [ {in [prefix-filter] | out | slow} ]}]
```

Syntax Description

| | |
|-------------------------------------|---|
| * | Specifies that all current BGP sessions will be reset. |
| all | (Optional) Specifies the reset of all address family sessions. |
| <i>autonomous-system-number</i> | Number of the autonomous system in which all BGP peer sessions will be reset. Number in the range from 1 to 65535. <ul style="list-style-type: none"> In Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SXI1, Cisco IOS XE Release 2.4, and later releases, 4-byte autonomous system numbers are supported in the range from 65536 to 4294967295 in asplain notation and in the range from 1.0 to 65535.65535 in asdot notation. In Cisco IOS Release 12.0(32)S12, 12.4(24)T, and Cisco IOS XE Release 2.3, 4-byte autonomous system numbers are supported in the range from 1.0 to 65535.65535 in asdot notation only. For more details about autonomous system number formats, see the router bgp command. |
| <i>neighbor-address</i> | Specifies that only the identified BGP neighbor will be reset. The value for this argument can be an IPv4 or IPv6 address. |
| peer-group <i>group-name</i> | Specifies that only the identified BGP peer group will be reset. |
| in | (Optional) Initiates inbound reconfiguration. If neither the in nor out keywords are specified, both inbound and outbound sessions are reset. |
| prefix-filter | (Optional) Clears the existing outbound route filter (ORF) prefix list to trigger a new route refresh or soft reconfiguration, which updates the ORF prefix list. |
| out | (Optional) Initiates inbound or outbound reconfiguration. If neither the in nor out keywords are specified, both inbound and outbound sessions are reset. |
| slow | (Optional) Clears slow-peer status forcefully and moves it to original update group. |
| soft | (Optional) Initiates a soft reset. Does not tear down the session. |

Command Modes

Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **clear proximity ip bgp** command can be used to initiate a hard reset or soft reconfiguration. A hard reset tears down and rebuilds the specified peering sessions and rebuilds the BGP routing tables. A soft reconfiguration uses stored prefix information to reconfigure and activate BGP routing tables without tearing down existing peering sessions. Soft reconfiguration uses stored update information, at the cost of additional memory for storing the updates, to allow you to apply new BGP policy without disrupting the network. Soft reconfiguration can be configured for inbound or outbound sessions.

Note Due to the complexity of some of the keywords available for the **clear proximity ip bgp** command, some of the keywords are documented as separate commands. All of the complex keywords that are documented separately start with **clear ip bgp**. For example, for information on resetting BGP connections using hard or soft reconfiguration for all BGP neighbors in IPv4 address family sessions, refer to the **clear ip bgp ipv4** command.

Generating Updates from Stored Information

To generate new inbound updates from stored update information (rather than dynamically) without resetting the BGP session, you must preconfigure the local BGP router using the **neighbor soft-reconfiguration inbound** command. This preconfiguration causes the software to store all received updates without modification regardless of whether an update is accepted by the inbound policy. Storing updates is memory intensive and should be avoided if possible.

Outbound BGP soft configuration has no memory overhead and does not require any preconfiguration. You can trigger an outbound reconfiguration on the other side of the BGP session to make the new inbound policy take effect.

Use this command whenever any of the following changes occur:

- Additions or changes to the BGP-related access lists
- Changes to BGP-related weights
- Changes to BGP-related distribution lists
- Changes to BGP-related route maps

Dynamic Inbound Soft Reset

The route refresh capability, as defined in RFC 2918, allows the local router to reset inbound routing tables dynamically by exchanging route refresh requests to supporting peers. The route refresh capability does not store update information locally for non-disruptive policy changes. It instead relies on dynamic exchange with supporting peers. Route refresh is advertised through BGP capability negotiation. All BGP routers must support the route refresh capability.

To determine if a BGP router supports this capability, use the **show ip bgp neighbors** command. The following message is displayed in the output when the router supports the route refresh capability:

```
Received route refresh capability from peer.
```

If all BGP routers support the route refresh capability, use the **clear proximity ip bgp** command with the **in** keyword. You need not use the **soft** keyword, because soft reset is automatically assumed when the route refresh capability is supported.

Note After configuring a soft reset (inbound or outbound), it is normal for the BGP routing process to hold memory. The amount of memory that is held depends on the size of routing tables and the percentage of the memory chunks that are utilized. Partially used memory chunks will be used or released before more memory is allocated from the global router pool.

Examples

In the following example, a soft reconfiguration is initiated for the inbound session with the neighbor 10.100.0.1, and the outbound session is unaffected:

```
Device#clear proximity ip bgp 10.100.0.1 soft in
```

In the following example, the route refresh capability is enabled on the BGP neighbor routers and a soft reconfiguration is initiated for the inbound session with the neighbor 172.16.10.2, and the outbound session is unaffected:

```
Device#clear proximity ip bgp 172.16.10.2 in
```

In the following example, a hard reset is initiated for sessions with all routers in the autonomous system numbered 35700:

```
Device#clear proximity ip bgp 35700
```

In the following example, a hard reset is initiated for sessions with all routers in the 4-byte autonomous system numbered 65538 in asplain notation. This example requires Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SX11, Cisco IOS XE Release 2.4, or a later release.

```
Device#clear proximity ip bgp 65538
```

In the following example, a hard reset is initiated for sessions with all routers in the 4-byte autonomous system numbered 1.2 in asdot notation. This example requires Cisco IOS Release 12.0(32)SY8, 12.0(32)S12, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SX11, 12.4(24)T, and Cisco IOS XE Release 2.3, or a later release.

```
Device#clear proximity ip bgp 1.2
```

Related Commands

| Command | Description |
|---|---|
| bgp slow-peer split-update-group dynamic permanent | Moves a dynamically detected slow peer to a slow update group. |
| clear ip bgp ipv4 | Resets BGP connections using hard or soft reconfiguration for IPv4 address family sessions. |
| clear ip bgp ipv6 | Resets BGP connections using hard or soft reconfiguration for IPv6 address family sessions. |

| Command | Description |
|--|--|
| clear ip bgp vpv4 | Resets BGP connections using hard or soft reconfiguration for VPNv4 address family sessions. |

| neighbor slow-peer split-update-group dynamic permanent | Moves a dynamically detected slow peer to a slow update group. |
| neighbor soft-reconfiguration | Configures the Cisco IOS software to start storing updates. |
| router bgp | Configures the BGP routing process. |
| show ip bgp | Displays entries in the BGP routing table. |
| show ip bgp neighbors | Displays information about BGP and TCP connections to neighbors. |
| slow-peer split-update-group dynamic permanent | Moves a dynamically detected slow peer to a slow update group. |

default-information originate (OSPF)

To generate a default external route into an Open Shortest Path First (OSPF) routing domain, use the **default-information originate** command in router configuration or router address family topology configuration mode. To disable this feature, use the **no** form of this command.

default-information originate [**always**] [**metric** *metric-value*] [**metric-type** *type-value*] [**route-map** *map-name*]

no default-information originate [**always**] [**metric** *metric-value*] [**metric-type** *type-value*] [**route-map** *map-name*]

Syntax Description

| | |
|--------------------------------------|---|
| always | (Optional) Always advertises the default route regardless of whether the software has a default route. Note The always keyword includes the following exception when the route map is used. When a route map is used, the origination of the default route by OSPF is not bound to the existence of a default route in the routing table and the always keyword is ignored. |
| metric <i>metric-value</i> | (Optional) Metric used for generating the default route. If you omit a value and do not specify a value using the default-metric router configuration command, the default metric value is 10. The value used is specific to the protocol. |
| metric-type <i>type-value</i> | (Optional) External link type associated with the default route that is advertised into the OSPF routing domain. It can be one of the following values: <ul style="list-style-type: none"> Type 1 external route. Type 2 external route. The default is type 2 external route. |
| route-map <i>map-name</i> | (Optional) The routing process will generate the default route if the route map is satisfied. |

Command Default

This command is disabled by default. No default external route is generated into the OSPF routing domain.

Command Modes

Router configuration (config-router) Router address family topology configuration (config-router-af-topology)

Command History

| | |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
|-----------------------------|------------------------------|

Usage Guidelines

Whenever you use the **redistribute** or the **default-information** router configuration command to redistribute routes into an OSPF routing domain, the Cisco IOS software automatically becomes an Autonomous System Boundary Router (ASBR). However, an ASBR does not, by default, generate a default route into the OSPF routing domain. The software must still have a default route for itself before it generates one, except when you have specified the **always** keyword.

When a route map is used, the origination of the default route by OSPF is not bound to the existence of a default route in the routing table.

Release 12.2(33)SRB

If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the **default-information originate** command in router address family topology configuration mode in order for this OSPF router configuration command to become topology-aware.

Examples

The following example specifies a metric of 100 for the default route that is redistributed into the OSPF routing domain and specifies an external metric type of 1:

```
router ospf 109
 redistribute eigrp 108 metric 100 subnets
 default-information originate metric 100 metric-type 1
```

Related Commands

| Command | Description |
|----------------------------|--|
| default-information | Accepts exterior or default information into Enhanced Interior Gateway Routing Protocol (EIGRP) processes. |
| default-metric | Sets default metric values for routes. |
| redistribute (IP) | Redistributes routes from one routing domain into another routing domain. |

default-metric (BGP)

To set a default metric for routes redistributed into Border Gateway Protocol (BGP), use the **default-metric** command in address family or router configuration mode. To remove the configured value and return BGP to default operation, use the **no** form of this command.

default-metric *number*

no default-metric *number*

Syntax Description

| | |
|---------------|---|
| <i>number</i> | Default metric value applied to the redistributed route. The range of values for this argument is from 1 to 4294967295. |
|---------------|---|

Command Default

The following is default behavior if this command is not configured or if the **no** form of this command is entered:

- The metric of redistributed interior gateway protocol (IGP) routes is set to a value that is equal to the interior BGP (iBGP) metric.
- The metric of redistributed connected and static routes is set to 0.

When this command is enabled, the metric for redistributed connected routes is set to 0.

Command Modes

Address family configuration (config-router-af)

Router configuration (config-router)

Command History

Table 144:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **default-metric** command is used to set the metric value for routes redistributed into BGP and can be applied to any external BGP (eBGP) routes received and subsequently advertised internally to iBGP peers.

This value is the Multi Exit Discriminator (MED) that is evaluated by BGP during the best path selection process. The MED is a non-transitive value that is processed only within the local autonomous system and adjacent autonomous systems. The default metric is not set if the received route has a MED value.

Note When enabled, the **default-metric** command applies a metric value of 0 to redistributed connected routes. The **default-metric** command does not override metric values that are applied with the **redistribute** command.

Examples

In the following example, a metric of 1024 is set for routes redistributed into BGP from OSPF:

```
Device (config) #router bgp 50000
Device (config-router) #address-family ipv4 unicast

Device (config-router-af) #default-metric 1024
```

```
Device(config-router-af)#redistribute ospf 10
Device(config-router-af)#end
```

In the following configuration and output examples, a metric of 300 is set for eBGP routes received and advertised internally to an iBGP peer.

```
Device(config)#router bgp 65501
Device(config-router)#no synchronization
Device(config-router)#bgp log-neighbor-changes
Device(config-router)#network 172.16.1.0 mask 255.255.255.0
Device(config-router)#neighbor 172.16.1.1 remote-as 65501
Device(config-router)#neighbor 172.16.1.1 soft-reconfiguration inbound
Device(config-router)#neighbor 192.168.2.2 remote-as 65502
Device(config-router)#neighbor 192.168.2.2 soft-reconfiguration inbound
Device(config-router)#default-metric 300
Device(config-router)#no auto-summary
```

After the above configuration, some routes are received from the eBGP peer at 192.168.2.2 as shown in the output from the **show ip bgp neighbors received-routes** command.

```
Device#show ip bgp neighbors 192.168.2.2 received-routes

BGP table version is 7, local router ID is 192.168.2.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
               Network      Next Hop          Metric LocPrf Weight Path
*> 172.17.1.0/24    192.168.2.2          0      100     0 65502 i
```

After the received routes from the eBGP peer at 192.168.2.2 are advertised internally to iBGP peers, the output from the **show ip bgp neighbors received-routes** command shows that the metric (MED) has been set to 300 for these routes.

```
Device#show ip bgp neighbors 172.16.1.2 received-routes

BGP table version is 2, local router ID is 172.16.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
               Network      Next Hop          Metric LocPrf Weight Path
* i172.16.1.0/24    172.16.1.2          0      100     0 i
* i172.17.1.0/24    192.168.2.2        300    100     0 65502 i
Total number of prefixes 2
```

Related Commands

| Command | Description |
|--------------------------|---|
| redistribute (IP) | Redistributes routes from one routing domain into another routing domain. |

distance (OSPF)

To define an administrative distance, use the **distance** command in router configuration mode or VRF configuration mode. To remove the **distance** command and restore the system to its default condition, use the **no** form of this command.

```
distance weight
[ip-address wildcard-mask [access-list name]]
no distance weight ip-address wildcard-mask [access-list-name]
```

Syntax Description

| | |
|-------------------------|---|
| <i>weight</i> | Administrative distance. Range is 10 to 255. Used alone, the <i>weight</i> argument specifies a default administrative distance that the software uses when no other specification exists for a routing information source. Routes with a distance of 255 are not installed in the routing table. The table in the “Usage Guidelines” section lists the default administrative distances. |
| <i>ip-address</i> | (Optional) IP address in four-part dotted-decimal notation. |
| <i>wildcard-mask</i> | (Optional) Wildcard mask in four-part, dotted-decimal format. A bit set to 1 in the <i>wildcard-mask</i> argument instructs the software to ignore the corresponding bit in the address value. |
| <i>access-list-name</i> | (Optional) Name of an IP access list to be applied to incoming routing updates. |

Command Default

If this command is not specified, the administrative distance is the default. The table in the “Usage Guidelines” section lists the default administrative distances.

Command Modes

Router configuration (config-router)
VRF configuration (config-vrf)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes the appropriate task IDs. If the user group assignment is preventing you from using a command contact your AAA administrator for assistance.

An administrative distance is an integer from 10 to 255. In general, the higher the value, the lower the trust rating. An administrative distance of 255 means that the routing information source cannot be trusted at all and should be ignored. Weight values are subjective; no quantitative method exists for choosing weight values.

If an access list is used with this command, it is applied when a network is being inserted into the routing table. This behavior allows you to filter networks based on the IP prefix supplying the routing information. For example, you could filter possibly incorrect routing information from networking devices not under your administrative control.

The order in which you enter **distance** commands can affect the assigned administrative distances, as shown in the “Examples” section. The following table lists default administrative distances.

Table 145: Default Administrative Distances

| Rate Source | Default Distance |
|-------------------------------|------------------|
| Connected interface | 0 |
| Static route out on interface | 0 |
| Static route to next hop | 1 |
| EIGRP summary route | 5 |
| External BGP | 20 |
| Internal EIGRP | 90 |
| OSPF | 110 |
| IS-IS | 115 |
| RIP version 1 and 2 | 120 |
| External EIGRP | 170 |
| Internal BGP | 200 |
| Unknown | 255 |

Task ID

| Task ID | Operations |
|---------|-------------|
| ospf | read, write |

Examples

In the following example, the **router ospf** command sets up Open Shortest Path First (OSPF) routing instance 1. The first **distance** command sets the default administrative distance to 255, which instructs the software to ignore all routing updates from networking devices for which an explicit distance has not been set. The second **distance** command sets the administrative distance for all devices on the network 192.168.40.0 to 90.

```
Device#configure terminal
Device(config)#router ospf 1
Device(config-ospf)#distance 255
Device(config-ospf)#distance 90 192.168.40.0 0.0.0.255
```

Related Commands

| Command | Description |
|----------------------|--|
| distance bgp | Allows the use of external, internal, and local administrative distances that could be a better route to a BGP node. |
| distance ospf | Allows the use of external, internal, and local administrative distances that could be a better route to an OSPF node. |

| Command | Description |
|--------------------|--------------------------------------|
| router ospf | Configures the OSPF routing process. |

eigrp log-neighbor-changes

To enable the logging of changes in Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor adjacencies, use the **eigrp log-neighbor-changes** command in router configuration mode, address-family configuration mode, or service-family configuration mode. To disable the logging of changes in EIGRP neighbor adjacencies, use the **no** form of this command.

eigrp log-neighbor-changes
no eigrp log-neighbor-changes

Syntax Description

This command has no arguments or keywords.

Command Default

Adjacency changes are logged.

Command Modes

Router configuration (config-router) Address-family configuration (config-router-af) Service-family configuration (config-router-sf)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

This command enables the logging of neighbor adjacency changes to monitor the stability of the routing system and to help detect problems. Logging is enabled by default. To disable the logging of neighbor adjacency changes, use the **no** form of this command.

To enable the logging of changes for EIGRP address-family neighbor adjacencies, use the **eigrp log-neighbor-changes** command in address-family configuration mode.

To enable the logging of changes for EIGRP service-family neighbor adjacencies, use the **eigrp log-neighbor-changes** command in service-family configuration mode.

Examples

The following configuration disables logging of neighbor changes for EIGRP process 209:

```
Device(config)# router eigrp 209
Device(config-router)# no eigrp log-neighbor-changes
```

The following configuration enables logging of neighbor changes for EIGRP process 209:

```
Device(config)# router eigrp 209
Device(config-router)# eigrp log-neighbor-changes
```

The following example shows how to disable logging of neighbor changes for EIGRP address-family with autonomous-system 4453:

```
Device(config)# router eigrp virtual-name
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# no eigrp log-neighbor-changes
Device(config-router-af)# exit-address-family
```

The following configuration enables logging of neighbor changes for EIGRP service-family process 209:

```

Device(config)# router eigrp 209
Device(config-router)# service-family ipv4 autonomous-system 4453
Device(config-router-sf)# eigrp log-neighbor-changes
Device(config-router-sf)# exit-service-family

```

Related Commands

| Command | Description |
|-------------------------------|--|
| address-family (EIGRP) | Enters address-family configuration mode to configure an EIGRP routing instance. |
| exit-address-family | Exits address-family configuration mode. |
| exit-service-family | Exits service-family configuration mode. |
| router eigrp | Configures the EIGRP routing process. |
| service-family | Specifies service-family configuration mode. |

eigrp log-neighbor-warnings

To enable the logging of Enhanced Interior Gateway Routing Protocol (EIGRP) neighbor warning messages, use the **eigrp log-neighbor-warnings** command in router configuration mode, address-family configuration mode, or service-family configuration mode. To disable the logging of EIGRP neighbor warning messages, use the **no** form of this command.

eigrp log-neighbor-warnings [*seconds*]
no eigrp log-neighbor-warnings

Syntax Description

| | |
|----------------|--|
| <i>seconds</i> | (Optional) The time interval (in seconds) between repeated neighbor warning messages. The range is from 1 to 65535. The default is 10. |
|----------------|--|

Command Default

Neighbor warning messages are logged at 10-second intervals.

Command Modes

Router configuration (config-router) Address-family configuration (config-router-af) Service-family configuration (config-router-sf)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

When neighbor warning messages occur, they are logged by default. With this command, you can disable and enable neighbor warning messages, and you can configure the interval between repeated neighbor warning messages.

To enable the logging of warning messages for an EIGRP address family, use the **eigrp log-neighbor-warnings** command in address-family configuration mode.

To enable the logging of warning messages for an EIGRP service family, use the **eigrp log-neighbor-warnings** command in service-family configuration mode.

Examples

The following command will log neighbor warning messages for EIGRP process 209 and repeat the warning messages in 5-minute (300 seconds) intervals:

```
Device(config)# router eigrp 209
Device(config-router)# eigrp log-neighbor-warnings 300
```

The following example logs neighbor warning messages for the service family with autonomous system number 4453 and repeats the warning messages in five-minute (300 second) intervals:

```
Device(config)# router eigrp virtual-name
Device(config-router)# service-family ipv4 autonomous-system 4453
Device(config-router-sf)# eigrp log-neighbor-warnings 300
```

The following example logs neighbor warning messages for the address family with autonomous system number 4453 and repeats the warning messages in five-minute (300 second) intervals:

```
Device(config)# router eigrp virtual-name
```

```
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# eigrp log-neighbor-warnings 300
```

Related Commands

| Command | Description |
|-------------------------------|--|
| address-family (EIGRP) | Enters address-family configuration mode to configure an EIGRP routing instance. |
| exit-address-family | Exits address-family configuration mode. |
| exit-service-family | Exits service-family configuration mode. |
| router eigrp | Configures the EIGRP routing process. |
| service-family | Specifies service-family configuration mode. |

fast-reroute keep-all-paths

To create a list of all the candidate repair paths considered when a per-prefix loop-free alternate (LFA) Fast Reroute (FRR) route is computed, use the **fast-reroute keep-all-paths** command in router configuration mode. To disable prefix priority, use the **no** form of this command.

fast-reroute keep-all-paths
no fast-reroute keep-all-paths

Syntax Description This command has no arguments or keywords.

Command Default A list of candidate repair paths is not created.

Command Modes Router configuration (config-router)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines You can use the **fast-reroute keep-all-paths** command to display all the candidate repair paths that are considered when an LFA FRR repair path is computed. You can use this list to troubleshoot repair paths without having to enable debugs. However, this greatly increases memory consumption, and should, therefore, be reserved for testing.

Examples

The following example shows how to create a list of all the candidate LFA FRR repair paths:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 10
Device(config-router)# fast-reroute keep-all-paths
```

| Related Commands | Command | Description |
|------------------|--|---|
| | debug ip ospf fast-reroute | Displays debugging information for per-prefix LFA FRR paths. |
| | fast-reroute per-prefix enable | Configures a per-prefix LFA FRR path that redirects traffic to an alternative next hop other than the primary neighbor. |
| | fast-reroute tie-break | Configures the tiebreaking policy in selecting an LFA FRR repair path. |
| | ip ospf fast-reroute per-prefix | Configures an interface as either protecting or protected. |
| | prefix-priority | Configures a set of prefixes to have high priority for protection in an OSPF local RIB. |
| | router ospf | Configures an OSPF routing process. |
| | show ip ospf fast-reroute | Displays information about the prefixes protected by LFA FRR repair paths. |

| Command | Description |
|-------------------------------|--|
| show ip ospf interface | Displays OSPF interface information. |
| show ip ospf neighbor | Displays OSPF neighbor information on a per-interface basis. |
| show ip ospf rib | Displays information for the OSPF local RIB or locally redistributed routes. |

fast-reroute load-sharing disable (EIGRP)

To disable Fast Reroute (FRR) load sharing among Equal Cost Multipath (ECMP) loop-free alternates (LFAs) in an Enhanced Interior Gateway Routing Protocol (EIGRP) network, use the **fast-reroute load-sharing disable** command in router address family topology configuration mode. To enable FRR load sharing among ECMP LFAs, use the **no** form of this command.

fast-reroute load-sharing disable
no fast-reroute load-sharing disable

| | |
|---------------------------|--|
| Syntax Description | This command has no arguments or keywords. |
| Command Default | FRR load sharing among ECMP LFAs is enabled by default. |
| Command Modes | Router address family topology configuration (config-router-af-topology) |

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines

Use this command to disable FRR load sharing among ECMP LFAs when FRR can be enabled on a single LFA by using tiebreaking rules. These rules are used to select the best LFA (repair path) for a primary path in an EIGRP network when many candidate LFAs are available. However, if a tie-breaking rule cannot be applied to select LFAs, use the **no** form of this command to restore the device to its default settings.

Examples

The following example shows how to disable load sharing among ECMP LFAs in an EIGRP network:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp test
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# fast-reroute load-sharing disable
```

| Related Commands | Command | Description |
|------------------|--|--|
| | address-family ipv4 | Configures EIGRP for MTR. |
| | debug eigrp frr | Enables debugging of EIGRP FRR events. |
| | fast-reroute load-sharing disable | Disables FRR load sharing among prefixes in a network. |
| | fast-reroute per-prefix | Enables FRR per prefix in EIGRP networks. |
| | fast-reroute tie-break | Configures an FRR tiebreaking priority when there are multiple LFAs for a primary path in a network. |

| Command | Description |
|-------------------------------|--|
| router eigrp | Configures the EIGRP routing process. |
| show ip eigrp topology | Displays entries in the EIGRP topology table. |
| topology | Configures an EIGRP process to route IP traffic under the specified topology instance. |

fast-reroute per-prefix (EIGRP)

To enable Fast Reroute (FRR) per prefix in an Enhanced Interior Gateway Routing Protocol (EIGRP) network, use the **fast-reroute per-prefix** command in router address family topology configuration mode. To disable FRR per prefix in the EIGRP network, use the **no** form of this command.

```
fast-reroute per-prefix {all | route-map route-map-name}
no fast-reroute per-prefix {all | route-map route-map-name}
```

| Syntax Description | all | Enables FRR for all the available prefixes in the EIGRP network. |
|--------------------|-----------------------|--|
| | route-map | Enables FRR for prefixes that are specified by a route map. |
| | <i>route-map-name</i> | Name of the route map. |

Command Default FRR is not enabled for any prefix in a network.

Command Modes Router address family topology configuration (config-router-af-topology)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Examples

The following example shows how to enable FRR on all the available prefixes in an EIGRP network:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp test
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# fast-reroute per-prefix all
```

The following example shows how to enable FRR on the prefixes that are specified by a route map:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp test
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# fast-reroute per-prefix route-map map1
```

| Related Commands | Command | Description |
|------------------|--|--|
| | address-family ipv4 | Configures EIGRP for MTR. |
| | debug eigrp frr | Enables debugging of EIGRP FRR events. |
| | fast-reroute load-sharing disable | Disables FRR load sharing among prefixes in a network. |

| Command | Description |
|--------------------------------|--|
| fast-reroute per-prefix | Enables FRR per prefix in a network. |
| fast-reroute tie-break | Configures an FRR tiebreaking priority when there are multiple LFAs for a primary path in a network. |
| router eigrp | Configures the EIGRP routing process. |
| show ip eigrp topology | Displays entries in the EIGRP topology table. |
| topology | Configures an EIGRP process to route IP traffic under the specified topology instance. |

fast-reroute per-prefix enable (OSPF)

To configure a per-prefix LFA FRR path that redirects traffic to an alternative next hop other than the primary neighbor, use the **fast-reroute per-prefix enable** command in router configuration mode. To disable prefix priority, use the **no** form of this command.

fast-reroute per-prefix enable [*area area-id*] **prefix-priority** {**high** | **low**}
no fast-reroute per-prefix enable [*area area-id*] **prefix-priority** {**high** | **low**}

| Syntax Description | area | (Optional) Specifies an area in which to enable LFA FRR. |
|--------------------|------------------------|---|
| | <i>area-id</i> | OSPF area ID expressed as a decimal value, or in IP address format. |
| | prefix-priority | Specifies the priority of prefixes to be protected. |
| | high | Sets the prefix priority to high. |
| | low | Sets the prefix priority to low. |

Command Default LFA is enabled.

Command Modes Router configuration (config-router)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Examples

The following command shows how to configure an LFA, and specifies the prefix priority for protection:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 10
Device(config-router)# fast-reroute per-prefix enable prefix-priority low
```

| Related Commands | Command | Description |
|------------------|--|---|
| | debug ip ospf fast-reroute | Displays debugging information for per-prefix LFA FRR paths. |
| | fast-reroute keep-all-paths | Creates a list of all the candidate repair paths that were considered when a per-prefix LFA FRR route was computed. |
| | fast-reroute tie-break | Configures the FRR tiebreaking priority. |
| | ip ospf fast-reroute per-prefix | Configures an interface as either protecting or protected. |

| Command | Description |
|----------------------------------|---|
| prefix-priority | Configures a set of prefixes to have high priority for protection in an OSPF local RIB. |
| router ospf | Configures an OSPF routing process. |
| show ip ospf fast-reroute | Displays information about the prefixes protected by LFA FRR repair paths. |
| show ip ospf interface | Displays OSPF interface information. |
| show ip ospf neighbor | Displays OSPF neighbor information on a per-interface basis. |
| show ip ospf rib | Displays information for the OSPF local RIB or locally redistributed routes. |

fast-reroute per-prefix tie-break (OSPF)

To configure the tiebreaking policy in selecting in an LFA FRR repair path, use the **fast-reroute per-prefix tie-break** command in router configuration mode. To disable the configuration, use the **no** form of this command.

```
fast-reroute per-prefix tie-break {broadcast-interface-disjoint | downstream | interface-disjoint |
linecard-disjoint | node-protecting | primary-path | secondary-path | srlg} [required] {index
attribute-priority | lowest-metric index attribute-priority}
no fast-reroute per-prefix tie-break {broadcast-interface-disjoint | downstream | interface-disjoint |
linecard-disjoint | node-protecting | primary-path | secondary-path | srlg} [required] {index
attribute-priority | lowest-metric index attribute-priority}
```

| Syntax Description | |
|-------------------------------------|---|
| broadcast-interface-disjoint | Configures the interface protection attribute. |
| downstream | Configures LFAs whose metric to the protected destination is lower than the metric of the protecting node to the destination. |
| interface-disjoint | Configures the interface protection attribute. |
| linecard-disjoint | Configures the linecard protection attribute. |
| node-protecting | Configures the node-protecting repair path attribute. |
| primary-path | Configures the equal-cost multipath attribute. |
| secondary-path | Configures the not-equal-cost multipath attribute. |
| srlg | Configures the shared risk link group (SRLG) attribute. |
| required | (Optional) Specifies that the tiebreaker is required. |
| index | Specifies the tiebreak attribute priority. |
| <i>attribute-priority</i> | The tiebreak attribute priority number. Valid values are from 1 to 255. |
| lowest-metric | Configures the lowest metric repair path attribute. |

Command Default

If you do not configure a tiebreaker policy, repair path attributes are assigned in the following priority order:

1. SRLG
2. Primary path
3. Interface disjoint
4. Lowest metric
5. Line-card disjoint
6. Node protecting
7. Broadcast-interface disjoint

Command Modes Router configuration (config-router)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines

You must configure the **router ospf** command before you can configure the **fast-reroute per-prefix tie-break** command. You can use the **show ip ospf fast-reroute** command to display the default, or the current, tiebreak configuration.

The tiebreaker policy is evaluated in the configured or the default order. If the evaluation does not select any candidate, the repair path is selected by implicit load balancing. This means that repair path selection varies depending on the prefix.

The **primary-path** and **secondary-path** keywords configure the same attribute; configuring one automatically deletes the other from the tiebreaker policy.

You can configure the **required** keyword for all the attributes except the lowest metric. To be selected as the LFA repair path, a candidate must have all the tiebreaker attributes that are configured as *required*.

Examples

The commands in the following example show how to configure a tiebreaking policy that prioritizes SRLG as a required tiebreaker, and sets the priority index for it and for the lower-priority tiebreaking attributes:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 10
Device(config-router)# fast-reroute per-prefix tie-break srlg required index 10
Device(config-router)# fast-reroute per-prefix tie-break linecard-disjoint index 15
Device(config-router)# fast-reroute per-prefix tie-break downstream index 20
```

Related Commands

| Command | Description |
|--|--|
| debug ip ospf fast-reroute | Displays debugging information for per-prefix LFA FRR paths. |
| fast-reroute keep-all-paths | Creates a list of all the candidate repair paths that were considered when a per-prefix LFA FRR route was computed. |
| fast-reroute per-prefix enable | Configures a per-prefix loop-free alternative (LFA) route that redirects traffic to an alternative next hop other than the primary neighbor. |
| ip ospf fast-reroute per-prefix | Configures an interface as either protecting or protected. |
| prefix-priority | Configures a set of prefixes to have high priority for protection in an OSPF local RIB. |
| router ospf | Configures an OSPF routing process. |
| show ip ospf fast-reroute | Displays information about prefixes protected by LFA FRR repair paths. |
| show ip ospf interface | Displays OSPF interface information. |

| Command | Description |
|------------------------------|--|
| show ip ospf neighbor | Displays OSPF neighbor information on a per-interface basis. |
| show ip ospf rib | Displays information for the OSPF local RIB or locally redistributed routes. |

fast-reroute tie-break (EIGRP)

To enable EIGRP FRR to select a loop-free alternate (LFA) from among multiple candidate LFAs for a given primary path by configuring a tiebreaking attribute, use the **fast-reroute tie-break** command in router address family topology configuration mode. To disable EIGRP FRR from selecting LFAs based on the configured tiebreaking attribute, use the **no** form of this command. To revert the configuration to the default attributes and their associated priorities, use the **default** form of this command.

```
fast-reroute tie-break {interface-disjoint | linecard-disjoint | lowest-backup-path-metric | srlg-disjoint}
priority-number
no fast-reroute tie-break {interface-disjoint | linecard-disjoint | lowest-backup-path-metric | srlg-disjoint}
default fast-reroute tie-break {interface-disjoint | linecard-disjoint | lowest-backup-path-metric |
srlg-disjoint}
```

Syntax Description

| | |
|----------------------------------|---|
| interface-disjoint | Enables EIGRP FRR to choose an LFA that does not share the outgoing interface with the primary path. The default priority is 20. |
| linecard-disjoint | Enables EIGRP FRR to choose an LFA that does not share the line card with the primary path. The default priority is 40. |
| lowest-backup-path-metric | Enables EIGRP FRR to choose the LFA with the lowest metric to the protected destination. The default priority is 30. |
| srlg-disjoint | Enables EIGRP FRR to choose an LFA that does not share any Shared Risk Link Group (SRLG) with the primary path. The default priority is 10. |
| <i>priority-number</i> | Priority number assigned to the tiebreaking attribute. The range is from 1 to 255. |

Command Default

The default attributes and their associated priorities are used to determine the LFA. The following are the default priority of each attribute:

- **interface-disjoint**: 20
- **linecard-disjoint**: 40
- **lowest-backup-path-metric**: 30
- **srlg-disjoint**: 10

Command Modes

Router address family topology configuration (config-router-af-topology)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines

Use this command to configure tiebreaking rules when there are multiple LFAs for a given primary path. EIGRP allows you to use four attributes to configure tiebreaking rules. Each of the **interface-disjoint**,

linecard-disjoint, **lowest-backup-path-metric**, and **srlg-disjoint** keywords specifies an attribute and allows you to configure a tiebreaking rule based on the attribute. You can configure a priority value for each attribute. Tiebreaking rules are applied on the basis of the priority configured for each attribute. The lower the configured priority value, the higher the priority of the tiebreaking attribute.

Note An attribute cannot be configured more than once in an address family.

The **no** form of this command disables EIGRP from selecting the best LFA based on the configured tiebreaking attributes. When the **no** form of this command is used, EIGRP will either randomly select an LFA or resort to load sharing. The **default** form of this command will revert the configuration to the default attributes and their respective priorities.

Examples

The following example shows how to configure a tiebreaking rule by using the **interface-disjoint** keyword:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp test
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# fast-reroute tie-break interface-disjoint 2
```

The following example shows how to configure a tiebreaking rule by using the **linecard-disjoint** keyword:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp test
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# fast-reroute tie-break linecard-disjoint 3
```

The following example shows how to configure a tiebreaking rule by using the **lowest-backup-path-metric** keyword:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp test
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# fast-reroute tie-break lowest-backup-path-metric 4
```

The following example shows how to configure a tiebreaking rule by using the **srlg-disjoint** keyword:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp test
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# fast-reroute tie-break srlg-disjoint 5
```

Related Commands

| Command | Description |
|--|--|
| address-family ipv4 | Configures EIGRP for MTR. |
| debug eigrp frr | Enables debugging of EIGRP FRR events. |
| fast-reroute load-sharing disable | Disables FRR load sharing among prefixes in a network. |
| fast-reroute per-prefix | Enables the FRR per prefix in EIGRP networks. |
| fast-reroute tie-break | Configures an FRR tiebreaking priority when there are multiple LFAs for a primary path in a network. |
| router eigrp | Configures the EIGRP routing process. |
| show ip eigrp topology | Displays entries in the EIGRP topology table. |
| topology | Configures an EIGRP process to route IP traffic under the specified topology instance. |

ip authentication key-chain eigrp

To enable authentication of Enhanced Interior Gateway Routing Protocol (EIGRP) packets, use the **ip authentication key-chain eigrp** command in interface configuration mode. To disable such authentication, use the **no** form of this command.

```
ip authentication key-chain eigrp as-number key-chain
no ip authentication key-chain eigrp as-number key-chain
```

Syntax Description

| | |
|------------------|---|
| <i>as-number</i> | Autonomous system number to which the authentication applies. |
| <i>key-chain</i> | Name of the authentication key chain. |

Command Default

No authentication is provided for EIGRP packets.

Command Modes

Interface configuration (config-if) Virtual network interface (config-if-vnet)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example applies authentication to autonomous system 2 and identifies a key chain named SPORTS:

```
Device(config-if) #ip authentication key-chain eigrp 2 SPORTS
```

Related Commands

| Command | Description |
|-------------------------------------|---|
| accept-lifetime | Sets the time period during which the authentication key on a key chain is received as valid. |
| ip authentication mode eigrp | Specifies the type of authentication used in EIGRP packets. |
| key | Identifies an authentication key on a key chain. |
| key chain | Enables authentication of routing protocols. |
| key-string (authentication) | Specifies the authentication string for a key. |
| send-lifetime | Sets the time period during which an authentication key on a key chain is valid to be sent. |

ip authentication mode eigrp

To specify the type of authentication used in Enhanced Interior Gateway Routing Protocol (EIGRP) packets, use the **ip authentication mode eigrp** command in interface configuration mode. To disable that type of authentication, use the **no** form of this command.

```
ip authentication mode eigrp as-number md5
no ip authentication mode eigrp as-number md5
```

| Syntax Description | |
|--------------------|---|
| <i>as-number</i> | Autonomous system number. |
| md5 | Keyed Message Digest 5 (MD5) authentication. |

Command Default No authentication is provided for EIGRP packets.

Command Modes Interface configuration (config-if) Virtual network interface (config-if-vnet)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Configure authentication to prevent unapproved sources from introducing unauthorized or false routing messages. When authentication is configured, an MD5 keyed digest is added to each EIGRP packet in the specified autonomous system.

Examples

The following example configures the interface to use MD5 authentication in EIGRP packets in autonomous system 10:

```
Device (config-if) #ip authentication mode eigrp 10 md5
```

| Related Commands | Command | Description |
|------------------|--|---|
| | accept-lifetime | Sets the time period during which the authentication key on a key chain is received as valid. |
| | ip authentication key-chain eigrp | Enables authentication of EIGRP packets. |
| | key | Identifies an authentication key on a key chain. |
| | key chain | Enables authentication of routing protocols. |
| | key-string (authentication) | Specifies the authentication string for a key. |
| | send-lifetime | Sets the time period during which an authentication key on a key chain is valid to be sent. |

ip bandwidth-percent eigrp

To configure the percentage of bandwidth that may be used by Enhanced Interior Gateway Routing Protocol (EIGRP) on an interface, use the **ip bandwidth-percent eigrp** command in interface configuration mode. To restore the default value, use the **no** form of this command.

ip bandwidth-percent eigrp *as-number percent*
no ip bandwidth-percent eigrp *as-number percent*

| Syntax Description | |
|--------------------|--|
| <i>as-number</i> | Autonomous system number. |
| <i>percent</i> | Percent of bandwidth that EIGRP may use. |

Command Default EIGRP may use 50 percent of available bandwidth.

Command Modes Interface configuration (config-if) Virtual network interface (config-if-vnet)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines EIGRP will use up to 50 percent of the bandwidth of a link, as defined by the **bandwidth** interface configuration command. This command may be used if some other fraction of the bandwidth is desired. Note that values greater than 100 percent may be configured. The configuration option may be useful if the bandwidth is set artificially low for other reasons.

Examples The following example allows EIGRP to use up to 75 percent (42 kbps) of a 56-kbps serial link in autonomous system 209:

```
Device(config)#interface serial 0
Device(config-if)#bandwidth 56
Device(config-if)#ip bandwidth-percent eigrp 209 75
```

| Related Commands | Command | Description |
|------------------|------------------------------|--|
| | bandwidth (interface) | Sets a bandwidth value for an interface. |

ip cef load-sharing algorithm

To select a Cisco Express Forwarding load-balancing algorithm, use the **ip cef load-sharing algorithm** command in global configuration mode. To return to the default universal load-balancing algorithm, use the **no** form of this command.

ip cef load-sharing algorithm {**original** | [**universal** [*id*]]}
no ip cef load-sharing algorithm

Syntax Description

| | |
|------------------|---|
| original | Sets the load-balancing algorithm to the original algorithm based on a source and destination hash. |
| universal | Sets the load-balancing algorithm to the universal algorithm that uses a source and destination and an ID hash. |
| <i>id</i> | (Optional) Fixed identifier. |

Command Default

The universal load-balancing algorithm is selected by default. If you do not configure the fixed identifier for a load-balancing algorithm, the router automatically generates a unique ID.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The original Cisco Express Forwarding load-balancing algorithm produced distortions in load sharing across multiple devices because of the use of the same algorithm on every device. When the load-balancing algorithm is set to universal mode, each device on the network can make a different load sharing decision for each source-destination address pair, and that resolves load-balancing distortions.

Examples

The following example shows how to enable the Cisco Express Forwarding original load-balancing algorithm:

```
Device> enable
Device# configure terminal
Device(config)# ip cef load-sharing algorithm original
Device(config)# exit
```

Related Commands

| Command | Description |
|------------------------|--|
| ip load-sharing | Enables load balancing for Cisco Express Forwarding. |

ip community-list

To configure a BGP community list and to control which routes are permitted or denied based on their community values, use the **ip community-list** command in global configuration mode. To delete the community list, use the **no** form of this command.

Standard Community Lists

```
ip community-list {standard | standard list-name} {deny | permit} [community-number] [AA:NN]
[internet] [local-as] [no-advertise] [no-export] [gshut]
no ip community-list {standard | standard list-name}
```

Expanded Community Lists

```
ip community-list {expanded | expanded list-name} {deny | permit} regexp
no ip community-list {expanded | expanded list-name}
```

Syntax Description

| | |
|----------------------------------|---|
| <i>standard</i> | Standard community list number from 1 to 99 to identify one or more permit or deny groups of communities. |
| standard <i>list-name</i> | Configures a named standard community list. |
| deny | Denies routes that match the specified community or communities. |
| permit | Permits routes that match the specified community or communities. |
| <i>community-number</i> | (Optional) 32-bit number from 1 to 4294967200. A single community can be entered or multiple communities can be entered, each separated by a space. |

| | |
|---------------------|--|
| <code>AA :NN</code> | (Optional) Autonomous system number and network number entered in the 4-byte new community format. This value is configured with two 2-byte numbers separated by a colon. A number from 1 to 65535 can be entered for each 2-byte number. A single community can be entered or multiple communities can be entered, each separated by a space. |
| internet | (Optional) Specifies the Internet community. Routes with this community are advertised to all peers (internal and external). |
| local-as | (Optional) Specifies the local-as community. Routes with community are advertised to only peers that are part of the local autonomous system or to only peers within a subautonomous system of a confederation. These routes are not advertised to external peers or to other subautonomous systems within a confederation. |
| no-advertise | (Optional) Specifies the no-advertise community. Routes with this community are not advertised to any peer (internal or external). |
| no-export | (Optional) Specifies the no-export community. Routes with this community are advertised to only peers in the same autonomous system or to only other subautonomous systems within a confederation. These routes are not advertised to external peers. |

| | |
|----------------------------------|---|
| gshut | (Optional) Specifies the Graceful Shutdown (GSHUT) community. |
| <i>expanded</i> | Expanded community list number from 100 to 500 to identify one or more permit or deny groups of communities. |
| expanded <i>list-name</i> | Configures a named expanded community list. |
| <i>regexp</i> | Regular expression that is used to specify a pattern to match against an input string. Note Regular expressions can be used only with expanded community lists. |

Command Default BGP community exchange is not enabled by default.

Command Modes Global configuration (config)

Command History *Table 146:*

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **ip community-list** command is used to filter BGP routes based on one or more community values. BGP community values are configured as a 32-bit number (old format) or as a 4-byte number (new format). The new community format is enabled when the **ip bgp-community new-format** command is entered in global configuration mode. The new community format consists of a 4-byte value. The first two bytes represent the autonomous system number, and the trailing two bytes represent a user-defined network number. Named and numbered community lists are supported.

BGP community exchange is not enabled by default. The exchange of BGP community attributes between BGP peers is enabled on a per-neighbor basis with the **neighbor send-community** command. The BGP community attribute is defined in RFC 1997 and RFC 1998.

The Internet community is applied to all routes or prefixes by default, until any other community value is configured with this command or the **set community** command.

Use a route map to reference a community list and thereby apply policy routing or set values.

Community List Processing

Once a **permit** value has been configured to match a given set of communities, the community list defaults to an implicit deny for all other community values. Unlike an access list, it is feasible for a community list to contain only **deny** statements.

- When multiple communities are configured in the same **ip community-list** statement, a logical AND condition is created. All community values for a route must match the communities in the community list statement to satisfy an AND condition.
- When multiple communities are configured in separate **ip community-list** statements, a logical OR condition is created. The first list that matches a condition is processed.

Standard Community Lists

Standard community lists are used to configure well-known communities and specific community numbers. A maximum of 16 communities can be configured in a standard community list. If you attempt to configure more than 16 communities, the trailing communities that exceed the limit are not processed or saved to the running configuration file.

Expanded Community Lists

Expanded community lists are used to filter communities using a regular expression. Regular expressions are used to configure patterns to match community attributes. The order for matching using the * or + character is longest construct first. Nested constructs are matched from the outside in. Concatenated constructs are matched beginning at the left side. If a regular expression can match two different parts of an input string, it will match the earliest part first. For more information about configuring regular expressions, see the “Regular Expressions” appendix of the *Terminal Services Configuration Guide*.

Examples

In the following example, a standard community list is configured that permits routes from network 10 in autonomous system 50000:

```
Device(config)#ip community-list 1 permit 50000:10
```

In the following example, a standard community list is configured that permits only routes from peers in the same autonomous system or from subautonomous system peers in the same confederation:

```
Device(config)#ip community-list 1 permit no-export
```

In the following example, a standard community list is configured to deny routes that carry communities from network 40 in autonomous system 65534 and from network 60 in autonomous system 65412. This example shows a logical AND condition; all community values must match in order for the list to be processed.

```
Device(config)#ip community-list 2 deny 65534:40 65412:60
```

In the following example, a named, standard community list is configured that permits all routes within the local autonomous system or permits routes from network 20 in autonomous system 40000. This example shows a logical OR condition; the first match is processed.

```
Device(config)#ip community-list standard RED permit local-as
Device(config)#ip community-list standard RED permit 40000:20
```

In the following example, a standard community list is configured that denies routes with the GSHUT community and permits routes with the local-AS community. This example shows a logical OR condition; the first match is processed.

```
Device(config)#ip community-list 18 deny gshut
Device(config)#ip community-list 18 permit local-as
```

In the following example, an expanded community list is configured that denies routes that carry communities from any private autonomous system:

```
Device(config)#ip community-list 500 deny _64[6-9][0-9][0-9]_|_65[0-9][0-9][0-9]_
```

In the following example, a named expanded community list is configured that denies routes from network 1 to 99 in autonomous system 50000:

```
Device(config)#ip community-list expanded BLUE deny 50000:[0-9][0-9]_
```

Related Commands

| Command | Description |
|-----------------------------------|---|
| match community | Defines a BGP community that must match the community of a route. |
| neighbor send-community | Allows BGP community exchange with a neighbor. |
| neighbor shutdown graceful | Configures the BGP Graceful Shutdown feature. |
| route-map (IP) | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing. |
| set community | Sets the BGP communities attribute. |
| set comm-list delete | Removes communities from the community attribute of an inbound or outbound update. |
| show ip bgp community | Displays routes that belong to specified BGP communities. |
| show ip bgp regexp | Displays routes that match a locally configured regular expression. |

ip prefix-list

To create a prefix list or to add a prefix-list entry, use the **ip prefix-list** command in global configuration mode. To delete a prefix-list entry, use the **no** form of this command.

```
ip prefix-list {list-name [seq number] {deny | permit} network/length [ge ge-length] [le le-length]
| description description | sequence-number}
no ip prefix-list {list-name [seq number] [{deny | permit} network/length [ge ge-length] [le
le-length]} | description description | sequence-number}
```

Syntax Description

| | |
|-------------------------|--|
| <i>list-name</i> | Configures a name to identify the prefix list. Do not use the word “detail” or “summary” as a list name because they are keywords in the show ip prefix-list command. |
| seq | (Optional) Applies a sequence number to a prefix-list entry. |
| <i>number</i> | (Optional) Integer from 1 to 4294967294. If a sequence number is not entered when configuring this command, default sequence numbering is applied to the prefix list. The number 5 is applied to the first prefix entry, and subsequent unnumbered entries are incremented by 5. |
| deny | Denies access for a matching condition. |
| permit | Permits access for a matching condition. |
| <i>network / length</i> | Configures the network address and the length of the network mask in bits. The network number can be any valid IP address or prefix. The bit mask can be a number from 1 to 32. |
| ge | (Optional) Specifies the lesser value of a range (the “from” portion of the range description) by applying the <i>ge-length</i> argument to the range specified. Note The ge keyword represents the greater than or equal to operator. |
| <i>ge-length</i> | (Optional) Represents the minimum prefix length to be matched. |
| le | (Optional) Specifies the greater value of a range (the “to” portion of the range description) by applying the <i>le-length</i> argument to the range specified. Note The le keyword represents the less than or equal to operator. |
| <i>le-length</i> | (Optional) Represents the maximum prefix length to be matched. |
| description | (Optional) Configures a descriptive name for the prefix list. |
| <i>description</i> | (Optional) Descriptive name of the prefix list, from 1 to 80 characters in length. |
| sequence-number | (Optional) Enables or disables the use of sequence numbers for prefix lists. |

Command Default No prefix lists or prefix-list entries are created.

Command Modes Global configuration (config)

Command History

Table 147:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **ip prefix-list** command to configure IP prefix filtering. Prefix lists are configured with **permit** or **deny** keywords to either permit or deny a prefix based on a matching condition. An implicit deny is applied to traffic that does not match any prefix-list entry.

A prefix-list entry consists of an IP address and a bit mask. The IP address can be for a classful network, a subnet, or a single host route. The bit mask is a number from 1 to 32.

Prefix lists are configured to filter traffic based on a match of an exact prefix length or a match within a range when the **ge** and **le** keywords are used. The **ge** and **le** keywords are used to specify a range of prefix lengths and provide more flexible configuration than using only the *networklength* argument. A prefix list is processed using an exact match when neither the **ge** nor **le** keyword is specified. If only the **ge** value is specified, the range is the value entered for the **ge ge-length** argument to a full 32-bit length. If only the **le** value is specified, the range is from the value entered for the *networklength* argument to the **le le-length** argument. If both the **ge ge-length** and **le le-length** keywords and arguments are entered, the range is between the values used for the *ge-length* and *le-length* arguments.

The following formula shows this behavior:

$$\text{length} < \mathbf{ge} \text{ ge-length} < \mathbf{le} \text{ le-length} \leq 32$$

If the **seq** keyword is configured without a sequence number, the default sequence number is 5. In this scenario, the first prefix-list entry is assigned the number 5 and subsequent prefix list entries increment by 5. For example, the next two entries would have sequence numbers 10 and 15. If a sequence number is entered for the first prefix list entry but not for subsequent entries, the subsequent entry numbers increment by 5. For example, if the first configured sequence number is 3, subsequent entries will be 8, 13, and 18. Default sequence numbers can be suppressed by entering the **no ip prefix-list** command with the **seq** keyword.

Evaluation of a prefix list starts with the lowest sequence number and continues down the list until a match is found. When an IP address match is found, the permit or deny statement is applied to that network and the remainder of the list is not evaluated.

Tip For best performance, the most frequently processed prefix list statements should be configured with the lowest sequence numbers. The **seq number** keyword and argument can be used for resequencing.

A prefix list is applied to inbound or outbound updates for a specific peer by entering the **neighbor prefix-list** command. Prefix list information and counters are displayed in the output of the **show ip prefix-list** command. Prefix-list counters can be reset by entering the **clear ip prefix-list** command.

Examples

In the following example, a prefix list is configured to deny the default route 0.0.0.0/0:

```
Device(config)#ip prefix-list RED deny 0.0.0.0/0
```

In the following example, a prefix list is configured to permit traffic from the 172.16.1.0/24 subnet:

```
Device(config)#ip prefix-list BLUE permit 172.16.1.0/24
```

In the following example, a prefix list is configured to permit routes from the 10.0.0.0/8 network that have a mask length that is less than or equal to 24 bits:

```
Device(config)#ip prefix-list YELLOW permit 10.0.0.0/8 le 24
```

In the following example, a prefix list is configured to deny routes from the 10.0.0.0/8 network that have a mask length that is greater than or equal to 25 bits:

```
Device(config)#ip prefix-list PINK deny 10.0.0.0/8 ge 25
```

In the following example, a prefix list is configured to permit routes from any network that have a mask length from 8 to 24 bits:

```
Device(config)#ip prefix-list GREEN permit 0.0.0.0/0 ge 8 le 24
```

In the following example, a prefix list is configured to deny any route with any mask length from the 10.0.0.0/8 network:

```
Device(config)#ip prefix-list ORANGE deny 10.0.0.0/8 le 32
```

Related Commands

| Command | Description |
|-----------------------------------|--|
| clear ip prefix-list | Resets the prefix list entry counters. |
| ip prefix-list description | Adds a text description of a prefix list. |
| ip prefix-list sequence | Enables or disables default prefix-list sequencing. |
| match ip address | Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, and performs policy routing on packets. |
| neighbor prefix-list | Filters routes from the specified neighbor using a prefix list. |
| show ip prefix-list | Displays information about a prefix list or prefix list entries. |

ip hello-interval eigrp

To configure the hello interval for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **ip hello-interval eigrp** command in interface configuration mode. To restore the default value, use the **no** form of this command.

```
ip hello-interval eigrp as-number seconds
no ip hello-interval eigrp as-number [seconds]
```

Syntax Description

| | |
|------------------|--|
| <i>as-number</i> | Autonomous system number. |
| <i>seconds</i> | Hello interval (in seconds). The range is from 1 to 65535. |

Command Default

The hello interval for low-speed, nonbroadcast multiaccess (NBMA) networks is 60 seconds and 5 seconds for all other networks.

Command Modes

Interface configuration (config-if) Virtual network interface (config-if-vnet)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The default of 60 seconds applies only to low-speed, NBMA media. Low speed is considered to be a rate of T1 or slower, as specified with the **bandwidth** interface configuration command. Note that for the purposes of EIGRP, Frame Relay and Switched Multimegabit Data Service (SMDS) networks may be considered to be NBMA. These networks are considered NBMA if the interface has not been configured to use physical multicasting; otherwise, they are considered not to be NBMA.

Examples

The following example sets the hello interval for Ethernet interface 0 to 10 seconds:

```
Device(config)#interface ethernet 0
Device(config-if)#ip hello-interval eigrp 109 10
```

Related Commands

| Command | Description |
|------------------------------|---|
| bandwidth (interface) | Sets a bandwidth value for an interface. |
| ip hold-time eigrp | Configures the hold time for a particular EIGRP routing process designated by the autonomous system number. |

ip hold-time eigrp

To configure the hold time for an Enhanced Interior Gateway Routing Protocol (EIGRP) process, use the **ip hold-time eigrp** command in interface configuration mode. To restore the default value, use the **no** form of this command.

```
ip hold-time eigrp as-number seconds
no ip hold-time eigrp as-number seconds
```

Syntax Description

| | |
|------------------|---|
| <i>as-number</i> | Autonomous system number. |
| <i>seconds</i> | Hold time (in seconds). The range is from 1 to 65535. |

Command Default

The EIGRP hold time is 180 seconds for low-speed, nonbroadcast multiaccess (NBMA) networks and 15 seconds for all other networks.

Command Modes

Interface configuration (config-if) Virtual network interface (config-if-vnet)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

On very congested and large networks, the default hold time might not be sufficient time for all routers and access servers to receive hello packets from their neighbors. In this case, you may want to increase the hold time.

We recommend that the hold time be at least three times the hello interval. If a router does not receive a hello packet within the specified hold time, routes through this router are considered unavailable.

Increasing the hold time delays route convergence across the network.

The default of 180 seconds hold time and 60 seconds hello interval apply only to low-speed, NBMA media. Low speed is considered to be a rate of T1 or slower, as specified with the **bandwidth** interface configuration command.

Examples

The following example sets the hold time for Ethernet interface 0 to 40 seconds:

```
Device (config) #interface ethernet 0
Device (config-if) #ip hold-time eigrp 109 40
```

Related Commands

| Command | Description |
|--------------------------------|--|
| bandwidth (interface) | Sets a bandwidth value for an interface. |
| ip hello-interval eigrp | Configures the hello interval for the EIGRP routing process designated by an autonomous system number. |

ip load-sharing

To enable load balancing for Cisco Express Forwarding on an interface, use the **ip load-sharing** command in interface configuration mode. To disable load balancing for Cisco Express Forwarding on the interface, use the **no** form of this command.

```
ip load-sharing { per-destination }
no ip load-sharing
```

| | | |
|---------------------------|------------------------|---|
| Syntax Description | per-destination | Enables per-destination load balancing for Cisco Express Forwarding on the interface. |
|---------------------------|------------------------|---|

Command Default Per-destination load balancing is enabled by default when you enable Cisco Express Forwarding.

Command Modes Interface configuration (config-if)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Per-destination load balancing allows the device to use multiple, equal-cost paths to achieve load sharing. Packets for a given source-destination host pair are guaranteed to take the same path, even if multiple, equal-cost paths are available. Traffic for different source-destination host pairs tends to take different paths.

Examples

The following example shows how to enable per-destination load balancing:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# ip load-sharing per-destination
```

ip network-broadcast

To receive and accept the network-prefix-directed broadcast packets, configure the **ip network-broadcast** command at the interface of the device.

```
ip network-broadcast
```

Syntax Description This command has no arguments or keywords.

Command Default This command is disabled by default.

Command Modes Interface configuration (config-if)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines Configure the **ip network-broadcast** command at the ingress interface before configuring the **ip directed-broadcast** command at the egress interface. This ensures that the network-prefix-directed broadcast packets are received and accepted.

The **ip network-broadcast** command is disabled by default. If you do not configure this command, the network-prefix-directed broadcast packets are silently discarded.

Example

The following example shows how to enable the network to accept the network-prefix-directed broadcast packets at ingress and then configure the directed broadcast-to-physical broadcast translation on the egress interface.

```
Device# configure terminal
Device(config)#interface gigabitethernet 1/0/2
Device(config-if)#ip network-broadcast
Device(config-if)#exit
Device(config)#interface gigabitethernet 1/0/3
Device(config-if)#ip directed-broadcast
Device(config-if)#exit
```

ip ospf database-filter all out

To filter outgoing link-state advertisements (LSAs) to an Open Shortest Path First (OSPF) interface, use the **ip ospf database-filter all out** command in interface or virtual network interface configuration modes. To restore the forwarding of LSAs to the interface, use the **no** form of this command.

```
ip ospf database-filter all out [disable]
no ip ospf database-filter all out
```

| | | |
|---------------------------|----------------|--|
| Syntax Description | disable | (Optional) Disables the filtering of outgoing LSAs to an OSPF interface; all outgoing LSAs are flooded to the interface. |
| | Note | This keyword is available only in virtual network interface mode. |

Command Default This command is disabled by default. All outgoing LSAs are flooded to the interface.

Command Modes Interface configuration (config-if)
Virtual network interface (config-if-vnet)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command performs the same function that the **neighbor database-filter** command performs on a neighbor basis.

If the **ip ospf database-filter all out** command is enabled for a virtual network and you want to disable it, use the **disable** keyword in virtual network interface configuration mode.

Examples

The following example prevents filtering of OSPF LSAs to broadcast, nonbroadcast, or point-to-point networks reachable through Ethernet interface 0:

```
Device(config)#interface ethernet 0
Device(config-if)#ip ospf database-filter all out
```

| Related Commands | Command | Description |
|-------------------------|---------------------------------|--|
| | neighbor database-filter | Filters outgoing LSAs to an OSPF neighbor. |

ip ospf fast-reroute per-prefix

To configure an interface as a protecting or a protected interface in a per-prefix LFA repair path, use the **ip ospf fast-reroute per-prefix** command in interface configuration mode.

ip ospf fast-reroute per-prefix {candidate | protection} [disable]

Syntax Description

| | |
|-------------------|---|
| candidate | Specifies that the interface is protecting, that is, it can be used as the next hop in a repair path. |
| protection | Specifies that the interface is protected, that is, routes pointing to this interface can have a repair path. |
| disable | (Optional) Specifies that the interface is either protecting or protected. |

Command Default

All the interfaces are protected and are protecting.

Command Modes

Interface configuration (config-if)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines

If you know from the network topology that an interface cannot be used to reroute traffic, for example, if it goes to a customer site, you can use the **ip ospf fast-reroute per-prefix** command to disable it from being protecting interface.

Examples

The following example shows how to prohibit an interface from being a protecting interface:

```
Device> enable
Device# configure terminal
Device(config)# interface Ethernet 0/0
Device(config-if)# ip address 192.0.2.1 255.255.255.0
Device(config-if)# ip ospf fast-reroute per-prefix candidate disable
```

Related Commands

| Command | Description |
|------------------------------------|--|
| debug ip ospf fast-reroute | Displays debugging information for per-prefix LFA FRR paths. |
| fast-reroute per-prefix | Configures a per-prefix LFA route that redirects traffic to an alternative next hop other than the primary neighbor. |
| fast-reroute keep-all-paths | Creates a list of all the candidate repair paths that were considered when a per-prefix LFA FRR was computed. |
| fast-reroute tie-break | Configures the tiebreaking policy in an LFA FRR repair path. |
| prefix-priority | Configures a set of prefixes to have high priority for protection in an OSPF local RIB. |

| Command | Description |
|---------------------------|---|
| show ip ospf fast-reroute | Displays information about prefixes protected by LFA and IP FRR repair paths. |

ip ospf name-lookup

To configure Open Shortest Path First (OSPF) to look up Domain Name System (DNS) names for use in all OSPF **show EXEC** command displays, use the **ip ospf name-lookup** command in global configuration mode. To disable this function, use the **no** form of this command.

ip ospf name-lookup
no ip ospf name-lookup

Syntax Description This command has no arguments or keywords.

Command Default This command is disabled by default.

Command Modes Global configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command makes it easier to identify a router because the router is displayed by name rather than by its router ID or neighbor ID.

Examples

The following example configures OSPF to look up DNS names for use in all OSPF **show EXEC** command displays:

```
Device(config)#ip ospf name-lookup
```

ip split-horizon eigrp

To enable Enhanced Interior Gateway Routing Protocol (EIGRP) split horizon, use the **ip split-horizon eigrp** command in interface configuration mode. To disable split horizon, use the **no** form of this command.

ip split-horizon eigrp *as-number*
no ip split-horizon eigrp *as-number*

Syntax Description

| | |
|------------------|---------------------------|
| <i>as-number</i> | Autonomous system number. |
|------------------|---------------------------|

Command Default

The behavior of this command is enabled by default.

Command Modes

Interface configuration (config-if)
 Virtual network interface (config-if-vnet)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **no ip split-horizon eigrp** command to disable EIGRP split horizon in your configuration.

Examples

The following is an example of how to enable EIGRP split horizon:

```
Device(config-if)#ip split-horizon eigrp 101
```

Related Commands

| Command | Description |
|-------------------------------|--|
| ip split-horizon (RIP) | Enables the split horizon mechanism. |
| neighbor (EIGRP) | Defines a neighboring router with which to exchange routing information. |

ip summary-address eigrp

To configure address summarization for the Enhanced Interior Gateway Routing Protocol (EIGRP) on a specified interface, use the **ip summary-address eigrp** command in interface configuration or virtual network interface configuration mode. To disable the configuration, use the **no** form of this command.

```
ip summary-address eigrp as-number ip-address mask [admin-distance] [leak-map name]  
no ip summary-address eigrp as-number ip-address mask
```

Syntax Description

| | |
|-----------------------------|--|
| <i>as-number</i> | Autonomous system number. |
| <i>ip-address</i> | Summary IP address to apply to an interface. |
| <i>mask</i> | Subnet mask. |
| <i>admin-distance</i> | (Optional) Administrative distance. Range: 0 to 255. Note Starting with Cisco IOS XE Release 3.2S, the <i>admin-distance</i> argument was removed. Use the summary-metric command to configure the administrative distance. |
| leak-map <i>name</i> | (Optional) Specifies the route-map reference that is used to configure the route leaking through the summary. |

Command Default

- An administrative distance of 5 is applied to EIGRP summary routes.
- EIGRP automatically summarizes to the network level, even for a single host route.
- No summary addresses are predefined.
- The default administrative distance metric for EIGRP is 90.

Command Modes

Interface configuration (config-if)

Virtual network interface configuration (config-if-vnet)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **ip summary-address eigrp** command is used to configure interface-level address summarization. EIGRP summary routes are given an administrative-distance value of 5. The administrative-distance metric is used to advertise a summary without installing it in the routing table.

By default, EIGRP summarizes subnet routes to the network level. The **no auto-summary** command can be entered to configure the subnet-level summarization.

The summary address is not advertised to the peer if the administrative distance is configured as 255.

EIGRP Support for Leaking Routes

Configuring the **leak-map** keyword allows a component route that would otherwise be suppressed by the manual summary to be advertised. Any component subset of the summary can be leaked. A route map and access list must be defined to source the leaked route.

The following is the default behavior if an incomplete configuration is entered:

- If the **leak-map** keyword is configured to reference a nonexistent route map, the configuration of this keyword has no effect. The summary address is advertised but all component routes are suppressed.
- If the **leak-map** keyword is configured but the access list does not exist or the route map does not reference the access list, the summary address and all component routes are advertised.

If you are configuring a virtual-network trunk interface and you configure the **ip summary-address eigrp** command, the *admin-distance* value of the command is not inherited by the virtual networks running on the trunk interface because the administrative distance option is not supported in the **ip summary-address eigrp** command on virtual network subinterfaces.

Examples

The following example shows how to configure an administrative distance of 95 on Ethernet interface 0/0 for the 192.168.0.0/16 summary address:

```
Device(config)#router eigrp 1
Device(config-router)#no auto-summary
Device(config-router)#exit
Device(config)#interface Ethernet 0/0
Device(config-if)#ip summary-address eigrp 1 192.168.0.0 255.255.0.0 95
```

The following example shows how to configure the 10.1.1.0/24 subnet to be leaked through the 10.2.2.0 summary address:

```
Device(config)#router eigrp 1
Device(config-router)#exit
Device(config)#access-list 1 permit 10.1.1.0 0.0.0.255
Device(config)#route-map LEAK-10-1-1 permit 10
Device(config-route-map)#match ip address 1
Device(config-route-map)#exit
Device(config)#interface Serial 0/0
Device(config-if)#ip summary-address eigrp 1 10.2.2.0 255.0.0.0 leak-map LEAK-10-1-1
Device(config-if)#end
```

The following example configures GigabitEthernet interface 0/0/0 as a virtual network trunk interface:

```
Device(config)#interface gigabitethernet 0/0/0
Device(config-if)#vnet global
Device(config-if-vnet)#ip summary-address eigrp 1 10.3.3.0 255.0.0.0 33
```

Related Commands

| Command | Description |
|-----------------------------|---|
| auto-summary (EIGRP) | Configures automatic summarization of subnet routes to network-level routes (default behavior). |
| summary-metric | Configures fixed metrics for an EIGRP summary aggregate address. |

ip route static bfd

To specify static route bidirectional forwarding detection (BFD) neighbors, use the **ip route static bfd** command in global configuration mode. To remove a static route BFD neighbor, use the **no** form of this command

```
ip route static bfd { interface-type interface-number ip-address | vrf vrf-name } [group group-name]
[passive] [unassociate]
no ip route static bfd { interface-type interface-number ip-address | vrf vrf-name } [group group-name]
[passive] [unassociate]
```

| Syntax Description | | |
|--------------------|--|--|
| | <i>interface-type interface-number</i> | Interface type and number. |
| | <i>ip-address</i> | IP address of the gateway, in A.B.C.D format. |
| | vrf <i>vrf-name</i> | Specifies Virtual Routing and Forwarding (VRF) instance and the destination vrf name. |
| | group <i>group-name</i> | (Optional) Assigns a BFD group. The group-name is a character string of up to 32 characters specifying the BFD group name. |
| | unassociate | (Optional) Unassociates the static route configured for a BFD. |

Command Default No static route BFD neighbors are specified.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **ip route static bfd** command to specify static route BFD neighbors. All static routes that have the same interface and gateway specified in the configuration share the same BFD session for reachability notification.

All static routes that specify the same values for the *interface-type*, *interface-number*, and *ip-address* arguments will automatically use BFD to determine gateway reachability and take advantage of fast failure detection.

The **group** keyword assigns a BFD group. The static BFD configuration is added to the VPN routing and forwarding (VRF) instance with which the interface is associated. The **passive** keyword specifies the passive member of the group. Adding static BFD in a group without the **passive** keyword makes the BFD an active member of the group. A static route should be tracked by the active BFD configuration in order to trigger a BFD session for the group. To remove all the static BFD configurations (active and passive) of a specific group, use the **no ip route static bfd** command and specify the BFD group name.

The **unassociate** keyword specifies that a BFD neighbor is not associated with static route, and the BFD sessions are requested if an interface has been configured with BFD. This is useful in bringing up a BFDv4 session in the absence of an IPv4 static route. If the unassociate keyword is not provided, then the IPv4 static routes are associated with BFD sessions.

BFD requires that BFD sessions are initiated on both endpoint devices. Therefore, this command must be configured on each endpoint device.

The BFD static session on a switch virtual interface (SVI) is established only after the **bfd interval milliseconds min_rx milliseconds multiplier multiplier-value** command is disabled and enabled on that SVI.

To enable the static BFD sessions, perform the following steps:

1. Enable BFD timers on the SVI.

```
bfd interval milliseconds min_rx milliseconds multiplier multiplier-value
```

2. Enable BFD for the static IP route

```
ip route static bfd interface-type interface-number ip-address
```

3. Disable and enable the BFD timers on the SVI again.

```
no bfd interval milliseconds min_rx milliseconds multiplier multiplier-value
```

```
bfd interval milliseconds min_rx milliseconds multiplier multiplier-value
```

Examples

The following example shows how to configure BFD for all static routes through a specified neighbor, group, and active member of the group:

```
Device#configuration terminal  
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.1.1.1 group group1
```

The following example shows how to configure BFD for all static routes through a specified neighbor, group, and passive member of the group:

```
Device#configuration terminal  
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.2.2.2 group group1 passive
```

The following example shows how to configure BFD for all static routes in an unassociated mode without the group and passive keywords:

```
Device#configuration terminal  
Device(config)#ip route static bfd GigabitEthernet 1/0/1 10.2.2.2 unassociate
```

ipv6 route static bfd

To specify static route Bidirectional Forwarding Detection for IPv6 (BFDv6) neighbors, use the **ipv6 route static bfd** command in global configuration mode. To remove a static route BFDv6 neighbor, use the **no** form of this command

ipv6 route static bfd [**vrf** *vrf-name*] *interface-type interface-number ipv6-address* [**unassociated**]
no ipv6 route static bfd

| Syntax Description | | |
|--------------------|--|--|
| | vrf <i>vrf-name</i> | (Optional) Name of the virtual routing and forwarding (VRF) instance by which static routes should be specified. |
| | <i>interface-type interface-number</i> | Interface type and number. |
| | <i>ipv6-address</i> | IPv6 address of the neighbor. |
| | unassociated | (Optional) Moves a static BFD neighbor from associated mode to unassociated mode. |

Command Default No static route BFDv6 neighbors are specified.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the `ipv6 route static bfd` command to specify static route neighbors. All of the static routes that have the same interface and gateway specified in the configuration share the same BFDv6 session for reachability notification. BFDv6 requires that BFDv6 sessions are initiated on both endpoint routers. Therefore, this command must be configured on each endpoint router. An IPv6 static BFDv6 neighbor must be fully specified (with the interface and the neighbor address) and must be directly attached.

All static routes that specify the same values for `vrf vrf-name`, `interface-type interface-number`, and `ipv6-address` will automatically use BFDv6 to determine gateway reachability and take advantage of fast failure detection.

Examples

The following example creates a neighbor on Ethernet interface 0/0 with an address of 2001::1:

```
Device#configuration terminal
Device(config)#ipv6 route static bfd ethernet 0/0 2001::1
```

The following example converts the neighbor to unassociated mode:

```
Device#configuration terminal
Device(config)#ipv6 route static bfd ethernet 0/0 2001::1 unassociated
```

match tag

To filter routes that match specific route tags, use the **match tag** command in route-map configuration mode. To remove the tag entry, use the **no** form of this command.

match tag {*tag-value*|*tag-value-dotted-decimal*} [*. . . tag-value* | *. . . tag-value-dotted-decimal*]

no match tag {*tag-value*|*tag-value-dotted-decimal*} [*. . . tag-value* | *. . . tag-value-dotted-decimal*]

| Syntax Description | |
|---------------------------------|--|
| <i>tag-value</i> | Route tag value, in plain decimals. The valid range is from 0 to 4294967295. |
| <i>tag-value-dotted-decimal</i> | Route tag value, in dotted decimals. The valid range is from 0.0.0.0 to 255.255.255.255. |

Command Default No match tag values are defined.

Command Modes Route-map configuration (config-route-map)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines Ellipses (...) in the command syntax indicate that your command input can include multiple values for the *tag-value* and the *tag-value-dotted-decimal* arguments.

Examples

The following example shows how to match a route with a tag value of 5:

```
Device> enable
Device# configure terminal
Device(config)# route-map name
Device(config-route-map)# match tag 5
```

The following example shows how to match a route with a tag value of 10.10.10.10:

```
Device> enable
Device# configure terminal
Device(config)# route-map name
Device(config-route-map)# match tag 10.10.10.10
```

| Related Commands | Command | Description |
|------------------|-------------------------|--|
| | match as-path | Matches a BGP autonomous system path specified by an access list. |
| | match community | Matches a BGP community. |
| | match ip address | Distributes any route that has a destination address that performs policy routing on packets and is permitted by a standard or extended access list. |
| | route-map | Defines conditions for redistributing routes from one routing protocol to another, or enables policy routing. |

| Command | Description |
|-----------------------------|---|
| set automatic-tag | Automatically computes the tag value. |
| set level | Indicates where to import routes. |
| set local-preference | Specifies a preference value for autonomous system paths that pass a route map. |
| set metric | Sets the metric value for a routing protocol. |
| set metric-type | Sets the metric type for the destination routing protocol. |
| set next-hop | Specifies the address of the next hop. |
| set tag | Sets a tag value for a route. |

metric weights (EIGRP)

To tune the Enhanced Interior Gateway Routing Protocol (EIGRP) metric calculations, use the **metric weights** command in router configuration mode or address family configuration mode. To reset the values to their defaults, use the **no** form of this command.

Router Configuration

metric weights *tos k1 k2 k3 k4 k5*

no metric weights

Address Family Configuration

metric weights *tos [k1 [k2 [k3 [k4 [k5 [k6]]]]]]]*

no metric weights

| Syntax Description | | |
|--------------------------|--|--|
| <i>tos</i> | Type of service. This value must always be zero. | |
| <i>k1 k2 k3 k4 k5 k6</i> | (Optional) Constants that convert an EIGRP metric vector into a scalar quantity. Valid values are 0 to 255. Given below are the default values: <ul style="list-style-type: none"> • <i>k1</i>: 1 • <i>k2</i>: 0 • <i>k3</i>: 1 • <i>k4</i>: 0 • <i>k5</i>: 0 • <i>k6</i>: 0 <p>Note In address family configuration mode, if the values are not specified, default values are configured. The <i>k6</i> argument is supported only in address family configuration mode.</p> | |

Command Default EIGRP metric K values are set to their default values.

Command Modes Router configuration (config-router)
Address family configuration (config-router-af)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use this command to alter the default behavior of EIGRP routing and metric computation and to allow the tuning of the EIGRP metric calculation for a particular type of service (ToS).

If *k5* equals 0, the composite EIGRP metric is computed according to the following formula:

metric = [k1 * bandwidth + (k2 * bandwidth)/(256 – load) + k3 * delay + K6 * extended metrics]

If k5 does not equal zero, an additional operation is performed:

$$\text{metric} = \text{metric} * [\text{k5}/(\text{reliability} + \text{k4})]$$

Scaled Bandwidth= $10^7/\text{minimum interface bandwidth (in kilobits per second)} * 256$

Delay is in tens of microseconds for classic mode and pico seconds for named mode. In classic mode, a delay of hexadecimal FFFFFFFF (decimal 4294967295) indicates that the network is unreachable. In named mode, a delay of hexadecimal FFFFFFFFFF (decimal 281474976710655) indicates that the network is unreachable.

Reliability is given as a fraction of 255. That is, 255 is 100 percent reliability or a perfectly stable link.

Load is given as a fraction of 255. A load of 255 indicates a completely saturated link.

Examples

The following example shows how to set the metric weights to slightly different values than the defaults:

```
Device(config)#router eigrp 109
Device(config-router)#network 192.168.0.0
Device(config-router)#metric weights 0 2 0 2 0 0
```

The following example shows how to configure an address-family metric weight to ToS: 0; K1: 2; K2: 0; K3: 2; K4: 0; K5: 0; K6:1:

```
Device(config)#router eigrp virtual-name
Device(config-router)#address-family ipv4 autonomous-system 4533
Device(config-router-af)#metric weights 0 2 0 2 0 0 1
```

Related Commands

| Command | Description |
|-------------------------------|--|
| address-family (EIGRP) | Enters address family configuration mode to configure an EIGRP routing instance. |
| bandwidth (interface) | Sets a bandwidth value for an interface. |
| delay (interface) | Sets a delay value for an interface. |
| ipv6 router eigrp | Configures an IPv6 EIGRP routing process. |
| metric holddown | Keeps new EIGRP routing information from being used for a certain period of time. |
| metric maximum-hops | Causes IP routing software to advertise routes with a hop count higher than what is specified by the command (EIGRP only) as unreachable routes. |
| router eigrp | Configures an EIGRP routing process. |

neighbor advertisement-interval

To set the minimum route advertisement interval (MRAI) between the sending of BGP routing updates, use the **neighbor advertisement-interval** command in address family or router configuration mode. To restore the default value, use the **no** form of this command.

neighbor {*ip-address**peer-group-name*} **advertisement-interval** *seconds*
no neighbor {*ip-address**peer-group-name*} **advertisement-interval** *seconds*

| Syntax Description | | |
|------------------------|--|---|
| <i>ip-address</i> | | IP address of the neighbor. |
| <i>peer-group-name</i> | | Name of a BGP peer group. |
| <i>seconds</i> | | Time (in seconds) is specified by an integer ranging from 0 to 600. |

Command Default

eBGP sessions not in a VRF: 30 seconds
eBGP sessions in a VRF: 0 seconds
iBGP sessions: 0 seconds

Command Modes

Router configuration (config-router)

Command History *Table 148:*

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

When the MRAI is equal to 0 seconds, BGP routing updates are sent as soon as the BGP routing table changes. If you specify a BGP peer group by using the *peer-group-name* argument, all the members of the peer group will inherit the characteristic configured with this command.

Examples

The following router configuration mode example sets the minimum time between sending BGP routing updates to 10 seconds:

```
router bgp 5
 neighbor 10.4.4.4 advertisement-interval 10
```

The following address family configuration mode example sets the minimum time between sending BGP routing updates to 10 seconds:

```
router bgp 5
 address-family ipv4 unicast
 neighbor 10.4.4.4 advertisement-interval 10
```

Related Commands

| Command | Description |
|---------------------------------------|--|
| address-family ipv4 (BGP) | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes. |
| address-family vpnv4 | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| neighbor peer-group (creating) | Creates a BGP peer group. |

neighbor default-originate

To allow a BGP speaker (the local router) to send the default route 0.0.0.0 to a neighbor for use as a default route, use the **neighbor default-originate** command in address family or router configuration mode. To send no route as a default, use the **no** form of this command.

neighbor {*ip-address**peer-group-name*} **default-originate** [**route-map** *map-name*]
no neighbor {*ip-address**peer-group-name*} **default-originate** [**route-map** *map-name*]

| Syntax Description | | |
|--------------------|----------------------------------|--|
| | <i>ip-address</i> | IP address of the neighbor. |
| | <i>peer-group-name</i> | Name of a BGP peer group. |
| | route-map <i>map-name</i> | (Optional) Name of the route map. The route map allows route 0.0.0.0 to be injected conditionally. |

Command Default No default route is sent to the neighbor.

Command Modes Address family configuration (config-router-af)
 Router configuration (config-router)

Command History *Table 149:*

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command does not require the presence of 0.0.0.0 in the local router. When used with a route map, the default route 0.0.0.0 is injected if the route map contains a **match ip address** clause and there is a route that matches the IP access list exactly. The route map can contain other match clauses also.

You can use standard or extended access lists with the **neighbor default-originate** command.

Examples

In the following router configuration example, the local router injects route 0.0.0.0 to the neighbor 172.16.2.3 unconditionally:

```
router bgp 109
network 172.16.0.0
neighbor 172.16.2.3 remote-as 200
neighbor 172.16.2.3 default-originate
```

In the following example, the local router injects route 0.0.0.0 to the neighbor 172.16.2.3 only if there is a route to 192.168.68.0 (that is, if a route with any mask exists, such as 255.255.255.0 or 255.255.0.0):

```
router bgp 109
network 172.16.0.0
neighbor 172.16.2.3 remote-as 200
neighbor 172.16.2.3 default-originate route-map default-map
!
```

```

route-map default-map 10 permit
  match ip address 1
!
access-list 1 permit 192.168.68.0

```

In the following example, the last line of the configuration has been changed to show the use of an extended access list. The local router injects route 0.0.0.0 to the neighbor 172.16.2.3 only if there is a route to 192.168.68.0 with a mask of 255.255.0.0:

```

router bgp 109
  network 172.16.0.0
  neighbor 172.16.2.3 remote-as 200
  neighbor 172.16.2.3 default-originate route-map default-map
!
route-map default-map 10 permit
  match ip address 100
!
access-list 100 permit ip host 192.168.68.0 host 255.255.0.0

```

Related Commands

| Command | Description |
|----------------------------------|--|
| address-family ipv4 (BGP) | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes. |
| address-family vpnv4 | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| neighbor ebgp-multihop | Accepts and attempts BGP connections to external peers residing on networks that are not directly connected. |

neighbor description

To associate a description with a neighbor, use the **neighbor description** command in router configuration mode or address family configuration mode. To remove the description, use the **no** form of this command.

neighbor {*ip-address**peer-group-name*} **description** *text*
no neighbor {*ip-address**peer-group-name*} **description** [*text*]

| Syntax Description | | |
|--------------------|------------------------|---|
| | <i>ip-address</i> | IP address of the neighbor. |
| | <i>peer-group-name</i> | Name of an EIGRP peer group. This argument is not available in address-family configuration mode. |
| | <i>text</i> | Text (up to 80 characters in length) that describes the neighbor. |

Command Default There is no description of the neighbor.

Command Modes Router configuration (config-router) Address family configuration (config-router-af)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

In the following examples, the description of the neighbor is “peer with example.com”:

```
Device(config)#router bgp 109
Device(config-router)#network 172.16.0.0
Device(config-router)#neighbor 172.16.2.3 description peer with example.com
```

In the following example, the description of the address family neighbor is “address-family-peer”:

```
Device(config)#router eigrp virtual-name
Device(config-router)#address-family ipv4 autonomous-system 4453
Device(config-router-af)#network 172.16.0.0
Device(config-router-af)#neighbor 172.16.2.3 description address-family-peer
```

| Related Commands | Command | Description |
|------------------|-------------------------------|--|
| | address-family (EIGRP) | Enters address family configuration mode to configure an EIGRP routing instance. |
| | network (EIGRP) | Specifies the network for an EIGRP routing process. |
| | router eigrp | Configures the EIGRP address family process. |

neighbor ebgp-multihop

To accept and attempt BGP connections to external peers residing on networks that are not directly connected, use the **neighbor ebgp-multihop** command in router configuration mode. To return to the default, use the **no** form of this command.

neighbor {*ip-address**ipv6-address**peer-group-name*} **ebgp-multihop** [*ttl*]
no neighbor {*ip-address**ipv6-address**peer-group-name*} **ebgp-multihop**

Syntax Description

| | |
|------------------------|--|
| <i>ip-address</i> | IP address of the BGP-speaking neighbor. |
| <i>ipv6-address</i> | IPv6 address of the BGP-speaking neighbor. |
| <i>peer-group-name</i> | Name of a BGP peer group. |
| <i>ttl</i> | (Optional) Time-to-live in the range from 1 to 255 hops. |

Command Default

Only directly connected neighbors are allowed.

Command Modes

Router configuration (config-router)

Command History

Table 150:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

This feature should be used only under the guidance of Cisco technical support staff.

If you specify a BGP peer group by using the *peer-group-name* argument, all the members of the peer group will inherit the characteristic configured with this command.

To prevent the creation of loops through oscillating routes, the multihop will not be established if the only route to the multihop peer is the default route (0.0.0.0).

Examples

The following example allows connections to or from neighbor 10.108.1.1, which resides on a network that is not directly connected:

```
Device(config)#router bgp 109
Device(config-router)#neighbor 10.108.1.1 ebgp-multihop
```

Related Commands

| Command | Description |
|---|---|
| neighbor advertise-map non-exist-map | Allows a BGP speaker (the local router) to send the default route 0.0.0.0 to a neighbor for use as a default route. |
| neighbor peer-group (creating) | Creates a BGP peer group. |
| network (BGP and multiprotocol BGP) | Specifies the list of networks for the BGP routing process. |

neighbor maximum-prefix (BGP)

To control how many prefixes can be received from a neighbor, use the **neighbor maximum-prefix** command in router configuration mode. To disable this function, use the **no** form of this command.

```
neighbor {ip-addresspeer-group-name} maximum-prefix maximum [threshold] [restart restart-interval]
[warning-only]
no neighbor {ip-addresspeer-group-name} maximum-prefix maximum
```

Syntax Description

| | |
|-------------------------|---|
| <i>ip-address</i> | IP address of the neighbor. |
| <i>peer-group-name</i> | Name of a Border Gateway Protocol (BGP) peer group. |
| <i>maximum</i> | Maximum number of prefixes allowed from the specified neighbor. The number of prefixes that can be configured is limited only by the available system resources on a router. |
| <i>threshold</i> | (Optional) Integer specifying at what percentage of the <i>maximum-prefix</i> limit the router starts to generate a warning message. The range is from 1 to 100; the default is 75. |
| restart | (Optional) Configures the router that is running BGP to automatically reestablish a peering session that has been disabled because the maximum-prefix limit has been exceeded. The restart timer is configured with the <i>restart-interval</i> argument. |
| <i>restart-interval</i> | (Optional) Time interval (in minutes) that a peering session is reestablished. The range is from 1 to 65535 minutes. |
| warning-only | (optional) Allows the router to generate a sys-log message when the <i>maximum-prefix</i> limit is exceeded, instead of terminating the peering session. |

Command Default

This command is disabled by default. Peering sessions are disabled when the maximum number of prefixes is exceeded. If the *restart-interval* argument is not configured, a disabled session will stay down after the maximum-prefix limit is exceeded.

threshold : 75 percent

Command Modes

Router configuration (config-router)

Command History

Table 151:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **neighbor maximum-prefix** command allows you to configure a maximum number of prefixes that a Border Gateway Protocol (BGP) routing process will accept from the specified peer. This feature provides a mechanism (in addition to distribute lists, filter lists, and route maps) to control prefixes received from a peer.

When the number of received prefixes exceeds the maximum number configured, BGP disables the peering session (by default). If the **restart** keyword is configured, BGP will automatically reestablish the peering

session at the configured time interval. If the **restart** keyword is not configured and a peering session is terminated because the maximum prefix limit has been exceeded, the peering session will not be reestablished until the **clear ip bgp** command is entered. If the **warning-only** keyword is configured, BGP sends only a log message and continues to peer with the sender.

There is no default limit on the number of prefixes that can be configured with this command. Limitations on the number of prefixes that can be configured are determined by the amount of available system resources.

Examples

In the following example, the maximum prefixes that will be accepted from the 192.168.1.1 neighbor is set to 1000:

```
Device(config)#router bgp 40000
Device(config-router)#network 192.168.0.0
Device(config-router)#neighbor 192.168.1.1 maximum-prefix 1000
```

In the following example, the maximum number of prefixes that will be accepted from the 192.168.2.2 neighbor is set to 5000. The router is also configured to display warning messages when 50 percent of the maximum-prefix limit (2500 prefixes) has been reached.

```
Device(config)#router bgp 40000
Device(config-router)#network 192.168.0.0
Device(config-router)#neighbor 192.168.2.2 maximum-prefix 5000 50
```

In the following example, the maximum number of prefixes that will be accepted from the 192.168.3.3 neighbor is set to 2000. The router is also configured to reestablish a disabled peering session after 30 minutes.

```
Device(config)#router bgp 40000
Device(config-router) network 192.168.0.0
Device(config-router)#neighbor 192.168.3.3 maximum-prefix 2000 restart 30
```

In the following example, warning messages will be displayed when the threshold of the maximum-prefix limit ($500 \times 0.75 = 375$) for the 192.168.4.4 neighbor is exceeded:

```
Device(config)#router bgp 40000
Device(config-router)#network 192.168.0.0
Device(config-router)#neighbor 192.168.4.4 maximum-prefix 500 warning-only
```

Related Commands

| Command | Description |
|---------------------|---|
| clear ip bgp | Resets a BGP connection using BGP soft reconfiguration. |

neighbor peer-group (assigning members)

To configure a BGP neighbor to be a member of a peer group, use the **neighbor peer-group** command in address family or router configuration mode. To remove the neighbor from the peer group, use the **no** form of this command.

neighbor {*ip-address*|*ipv6-address*} **peer-group** *peer-group-name*
no neighbor {*ip-address*|*ipv6-address*} **peer-group** *peer-group-name*

| Syntax Description | | |
|--------------------|------------------------|---|
| | <i>ip-address</i> | IP address of the BGP neighbor that belongs to the peer group specified by the <i>peer-group-name</i> argument. |
| | <i>ipv6-address</i> | IPv6 address of the BGP neighbor that belongs to the peer group specified by the <i>peer-group-name</i> argument. |
| | <i>peer-group-name</i> | Name of the BGP peer group to which this neighbor belongs. |

Command Default There are no BGP neighbors in a peer group.

Command Modes Address family configuration (config-router-af)
 Router configuration (config-router)

Command History *Table 152:*

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The neighbor at the IP address indicated inherits all the configured options of the peer group.

Note Using the **no** form of the **neighbor peer-group** command removes all of the BGP configuration for that neighbor, not just the peer group association.

Examples

The following router configuration mode example assigns three neighbors to the peer group named internal:

```
Device(config)#router bgp 100
Device(config-router)#neighbor internal peer-group
Device(config-router)#neighbor internal remote-as 100
Device(config-router)#neighbor internal update-source loopback 0
Device(config-router)#neighbor internal route-map set-med out
Device(config-router)#neighbor internal filter-list 1 out
Device(config-router)#neighbor internal filter-list 2 in
Device(config-router)#neighbor 172.16.232.53 peer-group internal
Device(config-router)#neighbor 172.16.232.54 peer-group internal
```

```
Device(config-router)#neighbor 172.16.232.55 peer-group internal
Device(config-router)#neighbor 172.16.232.55 filter-list 3 in
```

The following address family configuration mode example assigns three neighbors to the peer group named internal:

```
Device(config)#router bgp 100
Device(config-router)#address-family ipv4 unicast
Device(config-router)#neighbor internal peer-group
Device(config-router)#neighbor internal remote-as 100
Device(config-router)#neighbor internal update-source loopback 0
Device(config-router)#neighbor internal route-map set-med out
Device(config-router)#neighbor internal filter-list 1 out
Device(config-router)#neighbor internal filter-list 2 in
Device(config-router)#neighbor 172.16.232.53 peer-group internal
Device(config-router)#neighbor 172.16.232.54 peer-group internal
Device(config-router)#neighbor 172.16.232.55 peer-group internal
Device(config-router)#neighbor 172.16.232.55 filter-list 3 in
```

Related Commands

| Command | Description |
|---------------------------------------|--|
| address-family ipv4 (BGP) | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes. |
| address-family vpnv4 | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| neighbor peer-group (creating) | Creates a BGP peer group. |
| neighbor shutdown | Disables a neighbor or peer group. |

neighbor peer-group (creating)

To create a BGP or multiprotocol BGP peer group, use the **neighbor peer-group** command in address family or router configuration mode. To remove the peer group and all of its members, use the **no** form of this command.

neighbor *peer-group-name* **peer-group**
no neighbor *peer-group-name* **peer-group**

| Syntax Description | |
|--------------------|--|
| | <i>peer-group-name</i> Name of the BGP peer group. |

Command Default There is no BGP peer group.

Command Modes Address family configuration (config-router-af)
 Router configuration (config-router)

Command History *Table 153:*

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Often in a BGP or multiprotocol BGP speaker, many neighbors are configured with the same update policies (that is, same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and make update calculation more efficient.

Note Peer group members can span multiple logical IP subnets, and can transmit, or pass along, routes from one peer group member to another.

Once a peer group is created with the **neighbor peer-group** command, it can be configured with the **neighbor** commands. By default, members of the peer group inherit all the configuration options of the peer group. Members also can be configured to override the options that do not affect outbound updates.

All the peer group members will inherit the current configuration as well as changes made to the peer group. Peer group members will always inherit the following configuration options by default:

- remote-as (if configured)
- version
- update-source
- outbound route-maps
- outbound filter-lists
- outbound distribute-lists

- minimum-advertisement-interval
- next-hop-self

If a peer group is not configured with a remote-as option, the members can be configured with the **neighbor** *{ip-address | peer-group-name}* **remote-as** command. This command allows you to create peer groups containing external BGP (eBGP) neighbors.

Examples

The following example configurations show how to create these types of neighbor peer group:

- internal Border Gateway Protocol (iBGP) peer group
- eBGP peer group
- Multiprotocol BGP peer group

In the following example, the peer group named internal configures the members of the peer group to be iBGP neighbors. By definition, this is an iBGP peer group because the **router bgp** command and the **neighbor remote-as** command indicate the same autonomous system (in this case, autonomous system 100). All the peer group members use loopback 0 as the update source and use set-med as the outbound route map. The **neighbor internal filter-list 2 in** command shows that, except for 172.16.232.55, all the neighbors have filter list 2 as the inbound filter list.

```
router bgp 100
neighbor internal peer-group
neighbor internal remote-as 100
neighbor internal update-source loopback 0
neighbor internal route-map set-med out
neighbor internal filter-list 1 out
neighbor internal filter-list 2 in
neighbor 172.16.232.53 peer-group internal
neighbor 172.16.232.54 peer-group internal
neighbor 172.16.232.55 peer-group internal
neighbor 172.16.232.55 filter-list 3 in
```

The following example defines the peer group named external-peers without the **neighbor remote-as** command. By definition, this is an eBGP peer group because each individual member of the peer group is configured with its respective autonomous system number separately. Thus the peer group consists of members from autonomous systems 200, 300, and 400. All the peer group members have the set-metric route map as an outbound route map and filter list 99 as an outbound filter list. Except for neighbor 172.16.232.110, all of them have 101 as the inbound filter list.

```
router bgp 100
neighbor external-peers peer-group
neighbor external-peers route-map set-metric out
neighbor external-peers filter-list 99 out
neighbor external-peers filter-list 101 in
neighbor 172.16.232.90 remote-as 200
neighbor 172.16.232.90 peer-group external-peers
neighbor 172.16.232.100 remote-as 300
neighbor 172.16.232.100 peer-group external-peers
neighbor 172.16.232.110 remote-as 400
neighbor 172.16.232.110 peer-group external-peers
neighbor 172.16.232.110 filter-list 400 in
```

In the following example, all members of the peer group are multicast-capable:

```
router bgp 100
neighbor 10.1.1.1 remote-as 1
neighbor 172.16.2.2 remote-as 2
address-family ipv4 multicast
  neighbor mygroup peer-group
  neighbor 10.1.1.1 peer-group mygroup
  neighbor 172.16.2.2 peer-group mygroup
neighbor 10.1.1.1 activate
neighbor 172.16.2.2 activate
```

Related Commands

| Command | Description |
|----------------------------------|--|
| address-family ipv4 (BGP) | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IPv4 address prefixes. |
| address-family vpnv4 | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| clear ip bgp peer-group | Removes all the members of a BGP peer group. |
| show ip bgp peer-group | Displays information about BGP peer groups. |

neighbor route-map

To apply a route map to incoming or outgoing routes, use the **neighbor route-map** command in address family or router configuration mode. To remove a route map, use the **no** form of this command.

neighbor {*ip-address* *peer-group-name* | *ipv6-address* [%]} **route-map** *map-name* {**in** | **out**}
no neighbor {*ip-address* *peer-group-name* | *ipv6-address* [%]} **route-map** *map-name* {**in** | **out**}

Syntax Description

| | |
|------------------------|--|
| <i>ip-address</i> | IP address of the neighbor. |
| <i>peer-group-name</i> | Name of a BGP or multiprotocol BGP peer group. |
| <i>ipv6-address</i> | IPv6 address of the neighbor. |
| % | (Optional) IPv6 link-local address identifier. This keyword needs to be added whenever a link-local IPv6 address is used outside the context of its interface. |
| <i>map-name</i> | Name of a route map. |
| in | Applies route map to incoming routes. |
| out | Applies route map to outgoing routes. |

Command Default

No route maps are applied to a peer.

Command Modes

Router configuration (config-router)

| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

When specified in address family configuration mode, this command applies a route map to that particular address family only. When specified in router configuration mode, this command applies a route map to IPv4 or IPv6 unicast routes only.

If an outbound route map is specified, it is proper behavior to only advertise routes that match at least one section of the route map.

If you specify a BGP or multiprotocol BGP peer group by using the *peer-group-name* argument, all the members of the peer group will inherit the characteristic configured with this command. Specifying the command for a neighbor overrides the inbound policy that is inherited from the peer group.

The % keyword is used whenever link-local IPv6 addresses are used outside the context of their interfaces. This keyword does not need to be used for non-link-local IPv6 addresses.

Examples

The following router configuration mode example applies a route map named internal-map to a BGP incoming route from 172.16.70.24:

```
router bgp 5
```

```
neighbor 172.16.70.24 route-map internal-map in
route-map internal-map
match as-path 1
set local-preference 100
```

The following address family configuration mode example applies a route map named internal-map to a multiprotocol BGP incoming route from 172.16.70.24:

```
router bgp 5
address-family ipv4 multicast
neighbor 172.16.70.24 route-map internal-map in
route-map internal-map
match as-path 1
set local-preference 100
```

Related Commands

| Command | Description |
|----------------------------------|--|
| address-family ipv4 (BGP) | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IP Version 4 address prefixes. |
| address-family ipv6 | Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv6 address prefixes. |
| address-family vpv4 | Places the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPN Version 4 address prefixes. |
| address-family vpv6 | Places the router in address family configuration mode for configuring routing sessions that use standard VPNv6 address prefixes. |
| neighbor remote-as | Creates a BGP peer group. |

neighbor update-source

To have the Cisco software allow Border Gateway Protocol (BGP) sessions to use any operational interface for TCP connections, use the **neighbor update-source** command in router configuration mode. To restore the interface assignment to the closest interface, which is called the best local address, use the **no** form of this command.

neighbor {*ip-address* | *ipv6-address* [%]} *peer-group-name* **update-source** *interface-type interface-number*
neighbor {*ip-address* | *ipv6-address* [%]} *peer-group-name* **update-source** *interface-type interface-number*

Syntax Description

| | |
|-------------------------|--|
| <i>ip-address</i> | IPv4 address of the BGP-speaking neighbor. |
| <i>ipv6-address</i> | IPv6 address of the BGP-speaking neighbor. |
| % | (Optional) IPv6 link-local address identifier. This keyword needs to be added whenever a link-local IPv6 address is used outside the context of its interface. |
| <i>peer-group-name</i> | Name of a BGP peer group. |
| <i>interface-type</i> | Interface type. |
| <i>interface-number</i> | Interface number. |

Command Default

Best local address

Command Modes

Router configuration (config-router)

Command History

Table 155:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

This command can work in conjunction with the loopback interface feature described in the “Interface Configuration Overview” chapter of the Cisco IOS Interface and Hardware Component Configuration Guide.

If you specify a BGP peer group by using the *peer-group-name* argument, all the members of the peer group will inherit the characteristic configured with this command.

The **neighbor update-source** command must be used to enable IPv6 link-local peering for internal or external BGP sessions.

The % keyword is used whenever link-local IPv6 addresses are used outside the context of their interfaces and for these link-local IPv6 addresses you must specify the interface they are on. The syntax becomes <IPv6 local-link address>%<interface name>, for example, FE80::1%Ethernet1/0. Note that the interface type and number must not contain any spaces, and be used in full-length form because name shortening is not supported in this situation. The % keyword and subsequent interface syntax is not used for non-link-local IPv6 addresses.

Examples

The following example sources BGP TCP connections for the specified neighbor with the IP address of the loopback interface rather than the best local address:

```
Device(config)#router bgp 65000
Device(config-router)#network 172.16.0.0
Device(config-router)#neighbor 172.16.2.3 remote-as 110
Device(config-router)#neighbor 172.16.2.3 update-source Loopback0
```

The following example sources IPv6 BGP TCP connections for the specified neighbor in autonomous system 65000 with the global IPv6 address of loopback interface 0 and the specified neighbor in autonomous system 65400 with the link-local IPv6 address of Fast Ethernet interface 0/0. Note that the link-local IPv6 address of FE80::2 is on Ethernet interface 1/0.

```
Device(config)#router bgp 65000
Device(config-router)#neighbor 3ffe::3 remote-as 65000
Device(config-router)#neighbor 3ffe::3 update-source Loopback0
Device(config-router)#neighbor fe80::2%Ethernet1/0 remote-as 65400
Device(config-router)#neighbor fe80::2%Ethernet1/0 update-source FastEthernet 0/0
Device(config-router)#address-family ipv6
Device(config-router)#neighbor 3ffe::3 activate
Device(config-router)#neighbor fe80::2%Ethernet1/0 activate
Device(config-router)#exit-address-family
```

Related Commands

| Command | Description |
|---------------------------|--|
| neighbor activate | Enables the exchange of information with a BGP neighboring router. |
| neighbor remote-as | Adds an entry to the BGP or multiprotocol BGP neighbor table. |

network (BGP and multiprotocol BGP)

To specify the networks to be advertised by the Border Gateway Protocol (BGP) and multiprotocol BGP routing processes, use the **network** command in address family or router configuration mode. To remove an entry from the routing table, use the **no** form of this command.

network {*network-number* [**mask** *network-mask*]*nsap-prefix*} [**route-map** *map-tag*]
no network {*network-number* [**mask** *network-mask*]*nsap-prefix*} [**route-map** *map-tag*]

Syntax Description

| | |
|---------------------------------|--|
| <i>network-number</i> | Network that BGP or multiprotocol BGP will advertise. |
| mask <i>network-mask</i> | (Optional) Network or subnetwork mask with mask address. |
| <i>nsap-prefix</i> | Network service access point (NSAP) prefix of the Connectionless Network Service (CLNS) network that BGP or multiprotocol BGP will advertise. This argument is used only under NSAP address family configuration mode. |
| route-map <i>map-tag</i> | (Optional) Identifier of a configured route map. The route map should be examined to filter the networks to be advertised. If not specified, all networks are advertised. If the keyword is specified, but no route map tags are listed, no networks will be advertised. |

Command Default

No networks are specified.

Command Modes

Address family configuration (config-router-af)
 Router configuration (config-router)

Command History

Table 156:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

BGP and multiprotocol BGP networks can be learned from connected routes, from dynamic routing, and from static route sources.

The maximum number of **network** commands you can use is determined by the resources of the router, such as the configured NVRAM or RAM.

Examples

The following example sets up network 10.108.0.0 to be included in the BGP updates:

```
Device(config)#router bgp 65100
Device(config-router)#network 10.108.0.0
```

The following example sets up network 10.108.0.0 to be included in the multiprotocol BGP updates:

```
Device(config)#router bgp 64800
```

```
Device(config-router)#address family ipv4 multicast
Device(config-router)#network 10.108.0.0
```

The following example advertises NSAP prefix 49.6001 in the multiprotocol BGP updates:

```
Device(config)#router bgp 64500
Device(config-router)#address-family nsap
Device(config-router)#network 49.6001
```

Related Commands

| Command | Description |
|--|---|
| address-family ipv4 (BGP) | Enters the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard IP Version 4 address prefixes. |
| address-family vpnv4 | Enters the router in address family configuration mode for configuring routing sessions such as BGP, RIP, or static routing sessions that use standard VPNv4 address prefixes. |
| default-information originate (BGP) | Allows the redistribution of network 0.0.0.0 into BGP. |
| route-map (IP) | Defines the conditions for redistributing routes from one routing protocol into another. |
| router bgp | Configures the BGP routing process. |

network (EIGRP)

To specify the network for an Enhanced Interior Gateway Routing Protocol (EIGRP) routing process, use the **network** command in router configuration mode or address-family configuration mode. To remove an entry, use the **no** form of this command.

```
network ip-address [wildcard-mask]
no network ip-address [wildcard-mask]
```

| Syntax Description | |
|----------------------|--|
| <i>ip-address</i> | IP address of the directly connected network. |
| <i>wildcard-mask</i> | (Optional) EIGRP wildcard bits. Wildcard mask indicates a subnetwork, bitwise complement of the subnet mask. |

Command Default No networks are specified.

Command Modes Router configuration (config-router) Address-family configuration (config-router-af)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines When the **network** command is configured for an EIGRP routing process, the router matches one or more local interfaces. The **network** command matches only local interfaces that are configured with addresses that are within the same subnet as the address that has been configured with the **network** command. The router then establishes neighbors through the matched interfaces. There is no limit to the number of network statements (**network** commands) that can be configured on a router.

Use a wildcard mask as a shortcut to group networks together. A wildcard mask matches everything in the network part of an IP address with a zero. Wildcard masks target a specific host/IP address, entire network, subnet, or even a range of IP addresses.

When entered in address-family configuration mode, this command applies only to named EIGRP IPv4 configurations. Named IPv6 and Service Advertisement Framework (SAF) configurations do not support this command in address-family configuration mode.

Examples

The following example configures EIGRP autonomous system 1 and establishes neighbors through network 172.16.0.0 and 192.168.0.0:

```
Device (config) #router eigrp 1
Device (config-router) #network 172.16.0.0
Device (config-router) #network 192.168.0.0
Device (config-router) #network 192.168.0.0 0.0.255.255
```

The following example configures EIGRP address-family autonomous system 4453 and establishes neighbors through network 172.16.0.0 and 192.168.0.0:

```
Device (config) #router eigrp virtual-name
Device (config-router) #address-family ipv4 autonomous-system 4453
```

```
Device(config-router-af)#network 172.16.0.0  
Device(config-router-af)#network 192.168.0.0
```

Related Commands

| Command | Description |
|-------------------------------|--|
| address-family (EIGRP) | Enters address-family configuration mode to configure an EIGRP routing instance. |
| router eigrp | Configures the EIGRP address-family process. |

nsf (EIGRP)

To enable Cisco nonstop forwarding (NSF) operations for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **nsf** command in router configuration or address family configuration mode. To disable EIGRP NSF and to remove the EIGRP NSF configuration from the running-configuration file, use the **no** form of this command.

nsf
no nsf

Syntax Description This command has no arguments or keywords.

Command Default EIGRP NSF is disabled.

Command Modes Router configuration (config-router)
Address family configuration (config-router-af)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **nsf** command is used to enable or disable EIGRP NSF support on an NSF-capable router. NSF is supported only on platforms that support High Availability.

Examples The following example shows how to disable NSF:

```
Device#configure terminal
Device(config)#router eigrp 101
Device(config-router)#no nsf
Device(config-router)#end
```

The following example shows how to enable EIGRP IPv6 NSF:

```
Device#configure terminal
Device(config)#router eigrp virtual-name-1
Device(config-router)#address-family ipv6 autonomous-system 10
Device(config-router-af)#nsf
Device(config-router-af)#end
```

| Related Commands | Command | Description |
|------------------|--|---|
| | debug eigrp address-family ipv6 notifications | Displays information about EIGRP address family IPv6 event notifications. |
| | debug eigrp nsf | Displays notifications and information about NSF events for an EIGRP routing process. |
| | debug ip eigrp notifications | Displays information and notifications for an EIGRP routing process. |

| Command | Description |
|---|---|
| show ip protocols | Displays the parameters and the current state of the active routing protocol process. |
| show ipv6 protocols | Displays the parameters and the current state of the active IPv6 routing protocol process. |
| timers graceful-restart purge-time | Sets the graceful-restart purge-time timer to determine how long an NSF-aware router that is running EIGRP must hold routes for an inactive peer. |
| timers nsf converge | Sets the maximum time that the restarting router must wait for the end-of-table notification from an NSF-capable or NSF-aware peer. |
| timers nsf signal | Sets the maximum time for the initial restart period. |

offset-list (EIGRP)

To add an offset to incoming and outgoing metrics to routes learned via Enhanced Interior Gateway Routing Protocol (EIGRP), use the **offset-list** command in router configuration mode or address family topology configuration mode. To remove an offset list, use the **no** form of this command.

offset-list {*access-list-number**access-list-name*} {**in** | **out**} *offset* [*interface-type* *interface-number*]
no offset-list {*access-list-number**access-list-name*} {**in** | **out**} *offset* [*interface-type* *interface-number*]

Syntax Description

| | |
|--|--|
| <i>access-list-number</i> <i>access-list-name</i> | Standard access list number or name to be applied. Access list number 0 indicates all networks (networks, prefixes, or routes). If the <i>offset</i> value is 0, no action is taken. |
| in | Applies the access list to incoming metrics. |
| out | Applies the access list to outgoing metrics. |
| <i>offset</i> | Positive offset to be applied to metrics for networks matching the access list. If the offset is 0, no action is taken. |
| <i>interface-type</i> | (Optional) Interface type to which the offset list is applied. |
| <i>interface-number</i> | (Optional) Interface number to which the offset list is applied. |

Command Default

No offset values are added to incoming or outgoing metrics to routes learned via EIGRP.

Command Modes

Router configuration (config-router) Address family topology configuration (config-router-af-topology)

Command History

Table 157:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The offset value is added to the routing metric. An offset list with an interface type and interface number is considered extended and takes precedence over an offset list that is not extended. Therefore, if an entry passes the extended offset list and the normal offset list, the offset of the extended offset list is added to the metric.

Examples

In the following example, the router applies an offset of 10 to the delay component of the router only to access list 21:

```
Device(config-router)#offset-list 21 out 10
```

In the following example, the router applies an offset of 10 to routes learned from Ethernet interface 0:

```
Device(config-router)#offset-list 21 in 10 ethernet 0
```

In the following example, the router applies an offset of 10 to routes learned from Ethernet interface 0 in an EIGRP named configuration:

```
Device(config)#router eigrp virtual-name  
Device(config-router)#address-family ipv4 autonomous-system 1  
Device(config-router-af)#topology base  
Device(config-router-af-topology)#offset-list 21 in 10 ethernet0
```

redistribute (IP)

To redistribute routes from one routing domain into another routing domain, use the **redistribute** command in the appropriate configuration mode. To disable all or some part of the redistribution (depending on the protocol), use the **no** form of this command. See the “Usage Guidelines” section for detailed, protocol-specific behaviors.

```
redistribute protocol [process-id] {level-1 | level-1-2 | level-2} [autonomous-system-number] [metric
{metric-value | transparent}] [metric-type type-value] [match {internal | external 1 | external 2}]
[tag tag-value] [route-map map-tag] [subnets] [nssa-only]
no redistribute protocol [process-id] {level-1 | level-1-2 | level-2} [autonomous-system-number]
[metric {metric-value | transparent}] [metric-type type-value] [match {internal | external 1 |
external 2}] [tag tag-value] [route-map map-tag] [subnets] [nssa-only]
```

Syntax Description

| | |
|-----------------|---|
| <i>protocol</i> | <p>Source protocol from which routes are being redistributed. It can be one of the following keywords: application, bgp, connected, eigrp, isis, mobile, ospf, rip, or static [ip].</p> <p>The static [ip] keyword is used to redistribute IP static routes. The optional ip keyword is used when redistributing into the Intermediate System-to-Intermediate System (IS-IS) protocol.</p> <p>The application keyword is used to redistribute an application from one routing domain to another. You can redistribute more than one application to different routing protocols such as IS-IS, OSPF, Border Gateway Protocol (BGP), Enhanced Interior Gateway Routing Protocol (EIGRP) and Routing Information Protocol (RIP).</p> <p>The connected keyword refers to routes that are established automatically by virtue of having enabled IP on an interface. For routing protocols such as Open Shortest Path First (OSPF) and IS-IS, these routes will be redistributed as external to the autonomous system.</p> |
|-----------------|---|

| | |
|-----------------------------------|--|
| <i>process-id</i> | <p>(Optional) For the application keyword, this is the name of an application.</p> <p>For the bgp or eigrp keyword, this is an autonomous system number, which is a 16-bit decimal number.</p> <p>For the isis keyword, this is an optional <i>tag</i> value that defines a meaningful name for a routing process. Creating a name for a routing process means that you use names when configuring routing. You can configure a router in two routing domains and redistribute routing information between these two domains.</p> <p>For the ospf keyword, this is an appropriate OSPF process ID from which routes are to be redistributed. This identifies the routing process. This value takes the form of a nonzero decimal number.</p> <p>For the rip keyword, no <i>process-id</i> value is needed.</p> <p>For the application keyword, this is the name of an application.</p> <p>By default, no process ID is defined.</p> |
| level-1 | Specifies that, for IS-IS, Level 1 routes are redistributed into other IP routing protocols independently. |
| level-1-2 | Specifies that, for IS-IS, both Level 1 and Level 2 routes are redistributed into other IP routing protocols. |
| level-2 | Specifies that, for IS-IS, Level 2 routes are redistributed into other IP routing protocols independently. |
| <i>autonomous-system-number</i> | <p>(Optional) Autonomous system number for the redistributed route. The range is from 1 to 65535.</p> <ul style="list-style-type: none"> 4-byte autonomous system numbers are supported in the range from 1.0 to 65535.65535 in asdot notation only. <p>For more details about autonomous system number formats, see the router bgp command.</p> |
| metric <i>metric-value</i> | (Optional) When redistributing from one OSPF process to another OSPF process on the same router, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified. The default value is 0. |
| metric transparent | (Optional) Causes RIP to use the routing table metric for redistributed routes as the RIP metric. |

| | |
|--|---|
| metric-type <i>type value</i> | <p>(Optional) For OSPF, specifies the external link type associated with the default route advertised into the OSPF routing domain. It can be one of two values:</p> <ul style="list-style-type: none"> • 1—Type 1 external route • 2—Type 2 external route <p>If a metric-type is not specified, the Cisco IOS software adopts a Type 2 external route.</p> <p>For IS-IS, it can be one of two values:</p> <ul style="list-style-type: none"> • internal—IS-IS metric that is < 63. • external—IS-IS metric that is > 64 < 128. <p>The default is internal.</p> |
| match { internal external1 external2 } | <p>(Optional) Specifies the criteria by which OSPF routes are redistributed into other routing domains. It can be one of the following:</p> <ul style="list-style-type: none"> • internal—Routes that are internal to a specific autonomous system. • external 1—Routes that are external to the autonomous system, but are imported into OSPF as Type 1 external routes. • external 2—Routes that are external to the autonomous system, but are imported into OSPF as Type 2 external routes. <p>The default is internal.</p> |
| tag <i>tag-value</i> | <p>(Optional) Specifies the 32-bit decimal value attached to each external route. This is not used by OSPF itself. It may be used to communicate information between Autonomous System Boundary Routers (ASBRs). If none is specified, the remote autonomous system number is used for routes from BGP and Exterior Gateway Protocol (EGP); for other protocols, zero (0) is used.</p> |
| route-map | <p>(Optional) Specifies the route map that should be interrogated to filter the importation of routes from this source routing protocol to the current routing protocol. If not specified, all routes are redistributed. If this keyword is specified, but no route map tags are listed, no routes will be imported.</p> |
| <i>map-tag</i> | <p>(Optional) Identifier of a configured route map.</p> |

| | |
|------------------|--|
| subnets | (Optional) For redistributing routes into OSPF. Note Irrespective of whether the subnets keyword is configured or not, the subnets functionality is enabled by default. This automatic addition results in the redistribution of classless OSPF routes. |
| nssa-only | (Optional) Sets the nssa-only attribute for all routes redistributed into OSPF. |

Command Default Route redistribution is disabled.

Command Modes Router configuration (config-router)
Address family configuration (config-af)
Address family topology configuration (config-router-af-topology)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Using the no Form of the redistribute Command

Caution Removing options that you have configured for the **redistribute** command requires careful use of the **no** form of the **redistribute** command to ensure that you obtain the result that you are expecting. Changing or disabling any keyword may or may not affect the state of other keywords, depending on the protocol.

It is important to understand that different protocols implement the **no** form of the **redistribute** command differently:

- In BGP, OSPF, and RIP configurations, the **no redistribute** command removes only the specified keywords from the **redistribute** commands in the running configuration. They use the *subtractive keyword* method when redistributing from other protocols. For example, in the case of BGP, if you configure **no redistribute static route-map interior**, *only the route map* is removed from the redistribution, leaving **redistribute static** in place with no filter.
- The **no redistribute isis** command removes the IS-IS redistribution from the running configuration. IS-IS removes the entire command, regardless of whether IS-IS is the redistributed or redistributing protocol.
- EIGRP used the subtractive keyword method prior to EIGRP component version rel5. Starting with EIGRP component version rel5, the **no redistribute** command removes the entire **redistribute** command when redistributing from any other protocol.
- An EIGRP routing process is configured when you issue the **router eigrp** command and then specify a network for the process using the **network** sub-command. Suppose that you have not configured an EIGRP routing process, and that you have configured redistribution of routes from such an EIGRP process into BGP, OSPF, or RIP. If you use the **no redistribute eigrp** command to change or disable a parameter

in the **redistribute eigrp** command, the **no redistribute eigrp** command removes the entire **redistribute eigrp** command instead of changing or disabling a specific parameter.

Additional Usage Guidelines for the redistribute Command

A router receiving a link-state protocol with an internal metric will consider the cost of the route from itself to the redistributing router plus the advertised cost to reach the destination. An external metric only considers the advertised metric to reach the destination.

Routes learned from IP routing protocols can be redistributed at Level 1 into an attached area or at Level 2. The **level-1-2** keyword allows both Level 1 and Level 2 routes in a single command.

Redistributed routing information must be filtered by the **distribute-list out** router configuration command. This guideline ensures that only those routes intended by the administrator are passed along to the receiving routing protocol.

Whenever you use the **redistribute** or the **default-information** router configuration commands to redistribute routes into an OSPF routing domain, the router automatically becomes an ASBR. However, an ASBR does not, by default, generate a default route into the OSPF routing domain.

When routes are redistributed into OSPF from protocols other than OSPF or BGP, and no metric has been specified with the **metric-type** keyword and *type-value* argument, OSPF will use 20 as the default metric. When routes are redistributed into OSPF from BGP, OSPF will use 1 as the default metric. When routes are redistributed from one OSPF process to another OSPF process, autonomous system external and not-so-stubby-area (NSSA) routes will use 20 as the default metric. When intra-area and inter-area routes are redistributed between OSPF processes, the internal OSPF metric from the redistribution source process is advertised as the external metric in the redistribution destination process. (This is the only case in which the routing table metric will be preserved when routes are redistributed into OSPF.)

Note The **show ip ospf [topology-info]** command will display **subnets** keyword irrespective of whether the **subnets** keyword is configured or not. This is because the subnets functionality is enabled by default for OSPF.

On a router internal to an NSSA area, the **nssa-only** keyword causes the originated type-7 NSSA LSAs to have their propagate (P) bit set to zero, which prevents area border routers from translating these LSAs into type-5 external LSAs. On an area border router that is connected to an NSSA and normal areas, the **nssa-only** keyword causes the routes to be redistributed only into the NSSA areas.

Routes configured with the **connected** keyword affected by this **redistribute** command are the routes not specified by the **network** router configuration command.

You cannot use the **default-metric** command to affect the metric used to advertise connected routes.

Note The **metric** value specified in the **redistribute** command supersedes the **metric** value specified in the **default-metric** command.

The default redistribution of Interior Gateway Protocol (IGP) or Exterior Gateway Protocol (EGP) into BGP is not allowed unless the **default-information originate** router configuration command is specified.

4-Byte Autonomous System Number Support

The Cisco implementation of 4-byte autonomous system numbers uses asplain—65538 for example—as the default regular expression match and output display format for autonomous system numbers, but you can configure 4-byte autonomous system numbers in both the asplain format and the asdot format as described in RFC 5396. To change the default regular expression match and output display of 4-byte autonomous system numbers to asdot format, use the **bgp asnotation dot** command.

Examples

The following example shows how OSPF routes are redistributed into a BGP domain:

```
Device(config)# router bgp 109
Device(config-router)# redistribute ospf
```

The following example shows how to redistribute EIGRP routes into an OSPF domain:

```
Device(config)# router ospf 110
Device(config-router)# redistribute eigrp
```

The following example shows how to redistribute the specified EIGRP process routes into an OSPF domain. The EIGRP-derived metric will be remapped to 100 and RIP routes to 200.

```
Device(config)# router ospf 109
Device(config-router)# redistribute eigrp 108 metric 100 subnets
Device(config-router)# redistribute rip metric 200 subnets
```

The following example shows how to configure BGP routes to be redistributed into IS-IS. The link-state cost is specified as 5, and the metric type is set to external, indicating that it has lower priority than internal metrics.

```
Device(config)# router isis
Device(config-router)# redistribute bgp 120 metric 5 metric-type external
```

The following example shows how to redistribute an application into an OSPF domain and specify a metric value of 5:

```
Device(config)# router ospf 4
Device(config-router)# redistribute application am metric 5
```

In the following example, network 172.16.0.0 will appear as an external LSA in OSPF 1 with a cost of 100 (the cost is preserved):

```
Device(config)# interface ethernet 0
Device(config-if)# ip address 172.16.0.1 255.0.0.0
Device(config-if)# exit
Device(config)# ip ospf cost 100
Device(config)# interface ethernet 1
Device(config-if)# ip address 10.0.0.1 255.0.0.0
!
Device(config)# router ospf 1
Device(config-router)# network 10.0.0.0 0.255.255.255 area 0
Device(config-if)# exit
Device(config-router)# redistribute ospf 2 subnet
Device(config)# router ospf 2
Device(config-router)# network 172.16.0.0 0.255.255.255 area 0
```

The following example shows how BGP routes are redistributed into OSPF and assigned the local 4-byte autonomous system number in asplain format.

```
Device(config)# router ospf 2
Device(config-router)# redistribute bgp 65538
```

The following example shows how to remove the **connected metric 1000 subnets** options from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected** command in the configuration:

```
Device(config-router)# no redistribute connected metric 1000 subnets
```

The following example shows how to remove the **metric 1000** options from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected subnets** command in the configuration:

```
Device(config-router)# no redistribute connected metric 1000
```

The following example shows how to remove the **subnets** option from the **redistribute connected metric 1000 subnets** command and leave the **redistribute connected metric 1000** command in the configuration:

```
Device(config-router)# no redistribute connected subnets
```

The following example shows how to remove the **redistribute connected** command, and any of the options that were configured for the **redistribute connected** command, from the configuration:

```
Device(config-router)# no redistribute connected
```

The following example shows how EIGRP routes are redistributed into an EIGRP process in a named EIGRP configuration:

```
Device(config)# router eigrp virtual-name
Device(config-router)# address-family ipv4 autonomous-system 1
Device(config-router-af)# topology base
Device(config-router-af-topology)# redistribute eigrp 6473 metric 1 1 1 1 1
```

The following example shows how to set and disable the redistributions in EIGRP configuration. Note that, in the case of EIGRP, the **no** form of the commands removes the entire set of **redistribute** commands from the running configuration.

```
Device(config)# router eigrp 1
Device(config-router)# network 0.0.0.0
Device(config-router)# redistribute eigrp 2 route-map x
Device(config-router)# redistribute ospf 1 route-map x
Device(config-router)# redistribute bgp 1 route-map x
Device(config-router)# redistribute isis level-2 route-map x
Device(config-router)# redistribute rip route-map x

Device(config)# router eigrp 1
Device(config-router)# no redistribute eigrp 2 route-map x
Device(config-router)# no redistribute ospf 1 route-map x
Device(config-router)# no redistribute bgp 1 route-map x
Device(config-router)# no redistribute isis level-2 route-map x
Device(config-router)# no redistribute rip route-map x
Device(config-router)# end

Device# show running-config | section router eigrp 1

router eigrp 1
```

```
network 0.0.0.0
```

The following example shows how to set and disable the redistributions in OSPF configuration. Note that the **no** form of the commands removes only the specified keywords from the **redistribute** command in the running configuration.

```
Device(config)# router ospf 1
Device(config-router)# network 0.0.0.0
Device(config-router)# redistribute eigrp 2 route-map x
Device(config-router)# redistribute ospf 1 route-map x
Device(config-router)# redistribute bgp 1 route-map x
Device(config-router)# redistribute isis level-2 route-map x
Device(config-router)# redistribute rip route-map x

Device(config)# router ospf 1
Device(config-router)# no redistribute eigrp 2 route-map x
Device(config-router)# no redistribute ospf 1 route-map x
Device(config-router)# no redistribute bgp 1 route-map x
Device(config-router)# no redistribute isis level-2 route-map x
Device(config-router)# no redistribute rip route-map x
Device(config-router)# end

Device# show running-config | section router ospf 1

router ospf 1
 redistribute eigrp 2
 redistribute ospf 1
 redistribute bgp 1
 redistribute rip
 network 0.0.0.0
```

The following example shows how to remove only the route map filter from the redistribution in BGP; redistribution itself remains in force without a filter:

```
Device(config)# router bgp 65000
Device(config-router)# no redistribute eigrp 2 route-map x
```

The following example shows how to remove the EIGRP redistribution to BGP:

```
Device(config)# router bgp 65000
Device(config-router)# no redistribute eigrp 2
```

Related Commands

| Command | Description |
|---|--|
| default-information originate (OSPF) | Generates a default route into an OSPF routing domain. |
| router bgp | Configures the BGP routing process. |
| router eigrp | Configures the EIGRP address-family process. |

redistribute (IPv6)

To redistribute IPv6 routes from one routing domain into another routing domain, use the **redistribute** command in IPv6 address family configuration mode. To disable redistribution, use the **no** form of this command.

```
redistribute protocol [process-id][include-connected {level-1 | level-1-2 | level-2}] [as-number][metric metric-value][metric-type type-value][nssa-only][tag tag-value][route-map map-tag]
```

```
no redistribute protocol [process-id][include-connected {level-1 | level-1-2 | level-2}] [as-number][metric metric-value][metric-type type-value][nssa-only][tag tag-value][route-map map-tag]
```

Syntax Description

| | |
|-----------------------------------|---|
| <i>protocol</i> | Source protocol from which routes are redistributed. It can be one of the following keywords: bgp , connected , eigrp , isis , lisp , nd , omp , ospf (ospfv3), rip , or static . |
| <i>process-id</i> | (Optional) For the bgp or eigrp keyword, the process ID is an autonomous system number, which is a 16-bit decimal number. For the isis keyword, the process ID is an optional value that defines a meaningful name for a routing process. You can specify only one Intermediate System-to-Intermediate System (IS-IS) process per router. Creating a name for a routing process means that you use names when configuring routing. For the ospf keyword, the process ID is the number that is assigned administratively when the Open Shortest Path First (OSPF) for the IPv6 routing process is enabled. For the rip keyword, the process ID is an optional value that defines a meaningful name for an IPv6 Routing Information Protocol (RIP) routing process. |
| include-connected | (Optional) Allows the target protocol to redistribute routes that are learned by the source protocol and connected prefixes on those interfaces over which the source protocol is running. |
| level-1 | Specifies that for IS-IS, Level 1 routes are redistributed into other IPv6 routing protocols independently. |
| level-1-2 | Specifies that for IS-IS, both Level 1 and Level 2 routes are redistributed into other IPv6 routing protocols. |
| level-2 | Specifies that for IS-IS, Level 2 routes are redistributed into other IPv6 routing protocols independently. |
| <i>as-number</i> | (Optional) Autonomous system number for the redistributed route. |
| metric <i>metric-value</i> | (Optional) When redistributing from one OSPF process to another OSPF process on the same router, the metric is carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified. |

| | |
|---|--|
| metric-type <i>type-value</i> | (Optional) Specifies the external link type that is associated with the default route that is advertised into the routing domain. It can be one of two values: <ul style="list-style-type: none"> • 1: Type 1 external route • 2: Type 2 external route <p>If no value is specified for the metric-type keyword, the Cisco IOS software adopts a Type 2 external route.</p> |
| nssa-only | (Optional) Limits redistributed routes to not-so-stubby area (NSSA) |
| tag <i>tag-value</i> | (Optional) Specifies the 32-bit decimal value that is attached to each external route. This is not used by OSPF itself. It might be used to communicate information between Autonomous System Boundary Routers (ASBRs). If none is specified, then the remote autonomous system number is used for routes from the BGP and the Exterior Gateway Protocol (EGP); for other protocols, zero (0) is used. |
| route-map | (Optional) Specifies the route map that is checked to filter the import of routes from this source routing protocol to the current routing protocol. If the route-map keyword is not specified, all the routes are redistributed. If this keyword is specified, but no route map tags are listed, no routes are imported. |
| <i>map-tag</i> | (Optional) Identifier of a configured route map. |

Command Modes

Router configuration (config-router)
Address family configuration (config-router-af)

Command History

| Release | Modification |
|-----------------------------|--------------|
| Cisco IOS XE Everest 16.6.1 | This command |

Usage Guidelines

Changing or disabling a keyword does not affect the state of other keywords.

IS-IS ignores configured redistribution of routes, if any that are configured with the **include-connected** keyword. IS-IS advertises a prefix on an interface if either IS-IS is running over the interface or the interface is configured as passive.

Routes that are learned from IPv6 routing protocols are redistributed into IPv6 IS-IS at Level 1 into an attached area, or at Level 2. The **level-1-2** keyword allows both Level 1 and Level 2 routes in a single command.

For IPv6 RIP, use the **redistribute** command to advertise static routes as if they were directly connected routes.

Note Advertising static routes as directly connected routes might cause routing loops if improperly configured.

Redistributed IPv6 RIP routing information is always filtered by the **distribute-list prefix-list** command in router configuration mode. Using the **distribute-list prefix-list** command ensures that only those routes that are intended by the administrator are passed along to the receiving routing protocol.

Note The **metric** value that is specified in the **redistribute** command for IPv6 RIP supersedes the **metric** value that is specified using the **default-metric** command.

In IPv4, if you redistribute a protocol, by default, you also redistribute the subnet on the interfaces over which the protocol is running. In IPv6, this is not the default behavior. To redistribute the subnet on the interfaces over which the protocol is running in IPv6, use the **include-connected** keyword. In IPv6, this functionality is not supported when the source protocol is BGP.

When the **no redistribute** command is configured, the parameter settings are ignored when the client protocol is IS-IS or EIGRP.

IS-IS redistribution is removed completely when IS-IS Level 1 and Level 2 are removed by you. IS-IS level settings can be configured using the **redistribute** command only.

The default redistribute type is restored to OSPFv3 when all route type values are removed by you.

Specify the **nssa-only** keyword to clear the propagate bit (P-bit) when external routes are redistributed into an NSSA. Doing so prevents corresponding NSSA external link state advertisements (LSAs) from being translated into other areas.

Examples

The following example shows how to configure IPv6 IS-IS to redistribute IPv6 BGP routes. The metric is specified as 5, and the metric type is set to 1.

```
Device> enable
Device# configure terminal
Device(config)# router isis
Device(config-router)# address-family ipv6
Device(config-router-af)# redistribute bgp 64500 metric 5 metric-type 1
```

The following example shows how to redistribute IPv6 BGP routes into the IPv6 RIP routing process named cisco:

```
Device> enable
Device# configure terminal
Device(config)# router rip cisco
Device(config-router)# redistribute bgp 42
```

The following example shows how to redistribute IS-IS for IPv6 routes into the OSPFv3 for IPv6 routing process 1:

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 1
Device(config-router)# address-family ipv6
Device(config-router-af)# redistribute isis 1 metric 32 metric-type 1 tag 85
```

redistribute maximum-prefix (OSPF)

To limit the number of prefixes that are redistributed into Open Shortest Path First (OSPF) or to generate a warning when the number of prefixes that are redistributed into OSPF reaches a maximum, use the **redistribute maximum-prefix** command in router configuration mode. To remove the values, use the **no** form of this command.

redistribute maximum-prefix *maximum* [*{percentage}*][*{warning-only}*]
no redistribute

Syntax Description

| | |
|---------------------|--|
| <i>maximum</i> | Integer from 1 to 4294967295 that specifies the maximum number of IP or IPv6 prefixes that can be redistributed into OSPF. When the warning-only keyword is configured, the maximum value specifies the number of prefixes that can be redistributed into OSPF before the system logs a warning message. Redistribution is not limited. The maximum number of IP or IPv6 prefixes that are allowed to be redistributed into OSPF, or the number of prefixes that are allowed to be redistributed into OSPF before the system logs a warning message, depends on whether the warning-only keyword is present. There is no default value for the maximum argument. If the warning-only keyword is also configured, this value does not limit redistribution; it is simply the number of redistributed prefixes that, when reached, causes a warning message to be logged. |
| <i>percentage</i> | (Optional) Integer from 1 to 100 that specifies the threshold value, as a percentage, at which a warning message is generated. The default percentage is 75. |
| warning-only | (Optional) Causes a warning message to be logged when the number of prefixes that are defined by the <i>maximum</i> argument has been exceeded. Additional redistribution is not prevented. |

Command Default

The default percentage is 75.

Command Modes

Router configuration (config-router)
 Address family configuration (config-router-af)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A network can be severely flooded if many IP or IPv6 prefixes are injected into the OSPF, perhaps by redistributing Border Gateway Protocol (BGP) into OSPF. Limiting the number of redistributed prefixes prevents this potential problem.

When the **redistribute maximum-prefix** command is configured and the number of redistributed prefixes reaches the maximum value that is configured, no more prefixes are redistributed (unless the **warning-only** keyword is configured).

Examples

The following example shows how two warning messages are logged; the first if the number of prefixes redistributed reaches 85 percent of 600 (510 prefixes), and the second if the number of redistributed routes reaches 600. However, the number of redistributed routes is not limited.

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 11
Device(config-router)# address-family ipv6
Device(config-router-af)# redistribute eigrp 10 subnets
Device(config-router-af)# redistribute maximum-prefix 600 85 warning-only
```

The following example shows how to set a maximum of 10 prefixes that can be redistributed into an OSPFv3 process:

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 10
Device(config-router)# address-family ipv6 unicast
Device(config-router-af)# redistribute maximum-prefix 10
Device(config-router-af)# redistribute connected
```

rewrite-evpn-rt-asn

To enable the rewrite of the autonomous system number (ASN) portion of the EVPN route target extended community with the ASN of the target eBGP EVPN peer, use the **rewrite-evpn-rt-asn** command in address family configuration mode. Use the **no** form of the command to disable the rewrite of ASN.

rewrite-evpn-rt-asn
no rewrite-evpn-rt-asn

Syntax Description This command has no arguments or keywords.

Command Modes Address-family configuration (config-router-af)

| Command History | Release | Modification |
|-----------------|--------------------------------|-----------------------------|
| | Cisco IOS XE Gibraltar 16.12.1 | The command was introduced. |

Usage Guidelines The **rewrite-evpn-rt-asn** command is required for the route target auto feature to be used to configure EVPN route targets. Route target auto feature is implemented on all border leaf switches that support BGP EVPN.

The **rewrite-evpn-rt-asn** command only affects the following:

- EVPN address family.
- Inbound route-reception.
- Routes from eBGP peers.
- Route-type 2 and route-type 5 of EVPN prefixes.
- route target extended community inside the BGP update.

The **rewrite-evpn-rt-asn** command only works on type 0 and on type 2 of route-target extended communities.

Note Run this command only when route target auto feature is being used and matching route targets are not manually configured on all switches.

The following example shows how to enable rewrite of ASN using the **rewrite-evpn-rt-asn** command:

```
Device# configure terminal
Device(config)# router bgp 10000
Device(config-router)# address-family l2vpn evpn
Device(config-router-af)# rewrite-evpn-rt-asn
```

route-map

To define conditions for redistributing routes from one routing protocol to another routing protocol, or to enable policy routing, use the **route-map** command in global configuration mode. To delete an entry, use the **no** form of this command.

```
route-map map-tag [{permit | deny}] [sequence-number] ordering-seq sequence-name
no route-map map-tag [{permit | deny}] [sequence-number] ordering-seq sequence-name
```

| Syntax Description | | |
|--|--|--|
| <i>map-tag</i> | | Name for the route map. |
| permit | | (Optional) Permits only the routes matching the route map to be forwarded or redistributed. |
| deny | | (Optional) Blocks routes matching the route map from being forwarded or redistributed. |
| <i>sequence-number</i> | | (Optional) Number that indicates the position a new route map will have in the list of route maps already configured with the same name. |
| ordering-seq <i>sequence-name</i> | | (Optional) Orders the route maps based on the string provided. |

Command Default Policy routing is not enabled, and conditions for redistributing routes from one routing protocol to another routing protocol are not configured.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **route-map** command to enter route-map configuration mode.

Use route maps to redistribute routes, or to subject packets to policy routing. Both these purposes are described here.

Redistribution

Use the **route-map** global configuration command and the **match** and **set** route-map configuration commands to define the conditions for redistributing routes from one routing protocol to another. Each **route-map** command has a list of **match** and **set** commands associated with it. The **match** commands specify the *match criteria*, that is, the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the *set actions*, that is, the redistribution actions to be performed if the criteria enforced by the **match** commands are met. If the **route-map** command is enabled and the user does not specify any action, then the **permit** action is applied by default. The **no route-map** command deletes the route map.

The **match** route-map configuration command has multiple formats. The **match** commands can be run in any order, and all the **match** commands must match to cause the route to be redistributed according to the *set actions* specified with the **set** commands. The **no** forms of the **match** commands remove the specified match criteria.

Use route maps when you want detailed control over how routes are redistributed between routing processes. The destination routing protocol is the one you specify with the **router** global configuration command. The source routing protocol is the one you specify with the **redistribute** router configuration command. See the examples section for an illustration of how route maps are configured.

When passing routes through a route map, the route map can have several parts. Any route that does not match at least one **match** clause relating to a **route-map** command is ignored, that is, the route is not advertised for outbound route maps, and is not accepted for inbound route maps. If you want to modify only some data, configure a second route map section with an explicit match specified.

The **redistribute** router configuration command uses the name specified by the *map-tag* argument to reference a route map. Multiple route maps can share the same map tag name.

If the match criteria are met for this route map, and the **permit** keyword is specified, the route is redistributed as controlled by the set actions. In the case of policy routing, the packet is policy routed. If the match criteria are not met, and the **permit** keyword is specified, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set.

If the match criteria are met for the route map, and the **deny** keyword is specified, the route is not redistributed. In the case of policy routing, the packet is not policy routed, and no other route maps sharing the same map tag name are examined. If the packet is not policy routed, the normal forwarding algorithm is used.

Policy Routing

Another purpose of route maps is to enable policy routing. Use the **ip policy route-map** or **ipv6 policy route-map** command in addition to the **route-map** command, and the **match** and **set** commands to define the conditions for policy-routing packets. The **match** commands specify the conditions under which policy routing occurs. The **set** commands specify the routing actions to be performed if the criteria enforced by the **match** commands are met. We recommend that you policy route packets some way other than the obvious shortest path.

The *sequence-number* argument works as follows:

- If no entry is defined with the supplied tag, an entry is created with the *sequence-number* argument set to 10.
- If only one entry is defined with the supplied tag, that entry becomes the default entry for the **route-map** command. The *sequence-number* argument of this entry is unchanged.
- If more than one entry is defined with the supplied tag, an error message is displayed to indicate that the *sequence-number* argument is required.

If the **no route-map map-tag** command is specified (without the *sequence-number* argument), the entire route map is deleted.

Examples

The following example shows how to redistribute Routing Information Protocol (RIP) routes with a hop count equal to 1 to the Open Shortest Path First (OSPF). These routes will be redistributed to the OSPF as external link-state advertisements (LSAs) with a metric of 5, metric type of type1, and a tag equal to 1.

```
Device> enable
Device# configure terminal
Device(config)# router ospf 109
Device(config-router)# redistribute rip route-map rip-to-ospf
Device(config-router)# exit
Device(config)# route-map rip-to-ospf permit
```

```
Device(config-route-map) # match metric 1
Device(config-route-map) # set metric 5
Device(config-route-map) # set metric-type type1
Device(config-route-map) # set tag 1
```

The following example for IPv6 shows how to redistribute RIP routes with a hop count equal to 1 to the OSPF. These routes will be redistributed to the OSPF as external LSAs, with a tag equal to 42, and a metric type equal to type1.

```
Device> enable
Device# configure terminal
Device(config) # ipv6 router ospf 1
Device(config-router) # redistribute rip one route-map rip-to-ospfv3
Device(config-router) # exit
Device(config) # route-map rip-to-ospfv3
Device(config-route-map) # match tag 42
Device(config-route-map) # set metric-type type1
```

The following named configuration example shows how to redistribute Enhanced Interior Gateway Routing Protocol (EIGRP) addresses with a hop count equal to 1. These addresses are redistributed to the EIGRP as external, with a metric of 5, and a tag equal to 1:

```
Device> enable
Device# configure terminal
Device(config) # router eigrp virtual-name1
Device(config-router) # address-family ipv4 autonomous-system 4453
Device(config-router-af) # topology base
Device(config-router-af-topology) # redistribute eigrp 6473 route-map
virtual-name1-to-virtual-name2
Device(config-router-af-topology) # exit-address-topology
Device(config-router-af) # exit-address-family
Device(config-router) # router eigrp virtual-name2
Device(config-router) # address-family ipv4 autonomous-system 6473
Device(config-router-af) # topology base
Device(config-router-af-topology) # exit-af-topology
Device(config-router-af) # exit-address-family
Device(config) # route-map virtual-name1-to-virtual-name2
Device(config-route-map) # match tag 42
Device(config-route-map) # set metric 5
Device(config-route-map) # set tag 1
```

Related Commands

| Command | Description |
|------------------------------|---|
| ip policy route-map | Identifies a route map to use for policy routing on an interface. |
| ipv6 policy route-map | Configures IPv6 PBR on an interface. |
| match | Matches values from the routing table. |
| router eigrp | Configures the EIGRP address-family process. |
| set | Sets values in the destination routing protocol |
| show route-map | Displays all route maps configured or only the one specified. |

router-id

To use a fixed router ID, use the **router-id** command in router configuration mode. To force Open Shortest Path First (OSPF) to use the previous OSPF router ID behavior, use the **no** form of this command.

router-id *ip-address*
no router-id *ip-address*

Syntax Description

| | |
|-------------------|---------------------------------|
| <i>ip-address</i> | Router ID in IP address format. |
|-------------------|---------------------------------|

Command Default

No OSPF routing process is defined.

Command Modes

Router configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

You can configure an arbitrary value in the IP address format for each router. However, each router ID must be unique.

If this command is used on an OSPF router process which is already active (has neighbors), the new router-ID is used at the next reload or at a manual OSPF process restart. To manually restart the OSPF process, use the `clear ip ospf` command.

Examples

The following example specifies a fixed router-id:

```
router-id 10.1.1.1
```

Related Commands

| Command | Description |
|----------------------|---|
| clear ip ospf | Clears redistribution based on the OSPF routing process ID. |
| router ospf | Configures the OSPF routing process. |

router bgp

To configure the Border Gateway Protocol (BGP) routing process, use the **router bgp** command in global configuration mode. To remove a BGP routing process, use the **no** form of this command.

router bgp *autonomous-system-number*
no router bgp *autonomous-system-number*

Syntax Description

| | |
|---------------------------------|--|
| <i>autonomous-system-number</i> | Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. Number in the range from 1 to 65535. |
|---------------------------------|--|

Command Default

No BGP routing process is enabled by default.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

Usage Guidelines

This command allows you to set up a distributed routing core that automatically guarantees the loop-free exchange of routing information between autonomous systems.

Cisco has implemented the following two methods of representing autonomous system numbers:

- **Asplain**—Decimal value notation where both 2-byte and 4-byte autonomous system numbers are represented by their decimal value. For example, 65526 is a 2-byte autonomous system number and 234567 is a 4-byte autonomous system number.
- **Asdot**—Autonomous system dot notation where 2-byte autonomous system numbers are represented by their decimal value and 4-byte autonomous system numbers are represented by a dot notation. For example, 65526 is a 2-byte autonomous system number and 1.169031 is a 4-byte autonomous system number (this is dot notation for the 234567 decimal number).

For details about the third method of representing autonomous system numbers, see [RFC 5396](#).

Note In Cisco IOS releases that include 4-byte ASN support, command accounting and command authorization that include a 4-byte ASN number are sent in the asplain notation irrespective of the format that is used on the command-line interface.

Asplain as Default Autonomous System Number Formatting

The Cisco implementation of 4-byte autonomous system numbers uses asplain as the default display format for autonomous system numbers, but you can configure 4-byte autonomous system numbers in both the asplain and asdot format. In addition, the default format for matching 4-byte autonomous system numbers in regular expressions is asplain, so you must ensure that any regular expressions to match 4-byte autonomous system numbers are written in the asplain format. If you want to change the default **show** command output to display 4-byte autonomous system numbers in the asdot format, use the **bgp asnotation dot** command under router

configuration mode. When the asdot format is enabled as the default, any regular expressions to match 4-byte autonomous system numbers must be written using the asdot format, or the regular expression match will fail. The tables below show that although you can configure 4-byte autonomous system numbers in either asplain or asdot format, only one format is used to display **show** command output and control 4-byte autonomous system number matching for regular expressions, and the default is asplain format. To display 4-byte autonomous system numbers in **show** command output and to control matching for regular expressions in the asdot format, you must configure the **bgp asnotation dot** command. After enabling the **bgp asnotation dot** command, a hard reset must be initiated for all BGP sessions by entering the **clear ip bgp *** command.

Note If you are upgrading to an image that supports 4-byte autonomous system numbers, you can still use 2-byte autonomous system numbers. The **show** command output and regular expression match are not changed and remain in asplain (decimal value) format for 2-byte autonomous system numbers regardless of the format configured for 4-byte autonomous system numbers.

Table 159: Default Asplain 4-Byte Autonomous System Number Format

| Format | Configuration Format | Show Command Output and Regular Expression Match Format |
|---------|--|---|
| asplain | 2-byte: 1 to 65535 4-byte: 65536 to 4294967295 | 2-byte: 1 to 65535 4-byte: 65536 to 4294967295 |
| asdot | 2-byte: 1 to 65535 4-byte: 1.0 to 65535.65535 | 2-byte: 1 to 65535 4-byte: 65536 to 4294967295 |

Table 160: Asdot 4-Byte Autonomous System Number Format

| Format | Configuration Format | Show Command Output and Regular Expression Match Format |
|---------|--|---|
| asplain | 2-byte: 1 to 65535 4-byte: 65536 to 4294967295 | 2-byte: 1 to 65535 4-byte: 1.0 to 65535.65535 |
| asdot | 2-byte: 1 to 65535 4-byte: 1.0 to 65535.65535 | 2-byte: 1 to 65535 4-byte: 1.0 to 65535.65535 |

Reserved and Private Autonomous System Numbers

The Cisco implementation of BGP supports [RFC 4893](#). RFC 4893 was developed to allow BGP to support a gradual transition from 2-byte autonomous system numbers to 4-byte autonomous system numbers. A new reserved (private) autonomous system number, 23456, was created by RFC 4893 and this number cannot be configured as an autonomous system number in the Cisco IOS CLI.

[RFC 5398](#), *Autonomous System (AS) Number Reservation for Documentation Use*, describes new reserved autonomous system numbers for documentation purposes. Use of the reserved numbers allow configuration examples to be accurately documented and avoids conflict with production networks if these configurations are literally copied. The reserved numbers are documented in the IANA autonomous system number registry. Reserved 2-byte autonomous system numbers are in the contiguous block, 64496 to 64511 and reserved 4-byte autonomous system numbers are from 65536 to 65551 inclusive.

Private 2-byte autonomous system numbers are still valid in the range from 64512 to 65534 with 65535 being reserved for special use. Private autonomous system numbers can be used for internal routing domains but must be translated for traffic that is routed out to the Internet. BGP should not be configured to advertise

private autonomous system numbers to external networks. Cisco IOS software does not remove private autonomous system numbers from routing updates by default. Cisco recommends that ISPs filter private autonomous system numbers.

Note Autonomous system number assignment for public and private networks is governed by the IANA. For information about autonomous system numbers, including reserved number assignment, or to apply to register an autonomous system number, see the following URL: <http://www.iana.org/>.

Examples

The following example shows how to configure a BGP process for autonomous system 45000 and configures two external BGP neighbors in different autonomous systems using 2-byte autonomous system numbers:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 45000
Device(config-router)# neighbor 192.168.1.2 remote-as 40000
Device(config-router)# neighbor 192.168.3.2 remote-as 50000
Device(config-router)# neighbor 192.168.3.2 description finance
Device(config-router)# address-family ipv4
Device(config-router-af)# neighbor 192.168.1.2 activate
Device(config-router-af)# neighbor 192.168.3.2 activate
Device(config-router-af)# no auto-summary
Device(config-router-af)# no synchronization
Device(config-router-af)# network 172.17.1.0 mask 255.255.255.0
Device(config-router-af)# exit-address-family
```

The following example shows how to configure a BGP process for autonomous system 65538 and configures two external BGP neighbors in different autonomous systems using 4-byte autonomous system numbers in asplain notation. This example is supported in Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SXH1, Cisco IOS XE Release 2.4, and later releases.

```
Device> enable
Device# configure terminal
Device(config)# router bgp 65538
Device(config-router)# neighbor 192.168.1.2 remote-as 65536
Device(config-router)# neighbor 192.168.3.2 remote-as 65550
Device(config-router)# neighbor 192.168.3.2 description finance
Device(config-router)# address-family ipv4
Device(config-router-af)# neighbor 192.168.1.2 activate
Device(config-router-af)# neighbor 192.168.3.2 activate
Device(config-router-af)# no auto-summary
Device(config-router-af)# no synchronization
Device(config-router-af)# network 172.17.1.0 mask 255.255.255.0
Device(config-router-af)# exit-address-family
```

Related Commands

| Command | Description |
|--|---|
| neighbor remote-as | Adds an entry to the BGP or multiprotocol BGP neighbor table. |
| network (BGP and multiprotocol BGP) | Specifies the list of networks for the BGP routing process. |

router eigrp

To configure the EIGRP routing process, use the **router eigrp** command in global configuration mode. To remove an EIGRP routing process, use the **no** form of this command.

```
router eigrp {autonomous-system-numbervirtual-instance-name}
no router eigrp {autonomous-system-numbervirtual-instance-name}
```

| Syntax Description | |
|---------------------------------|--|
| <i>autonomous-system-number</i> | Autonomous system number that identifies the EIGRP services to the other EIGRP address-family routers. It is also used to tag routing information. Valid range is from 1 to 65535. |
| <i>virtual-instance-name</i> | EIGRP virtual instance name. This name must be unique among all the address-family router processes on a single router, but need not be unique among routers. |

Command Default No EIGRP processes are configured.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Configuring the **router eigrp** command with the *autonomous-system-number* argument creates an EIGRP configuration referred to as autonomous system (AS) configuration. An EIGRP AS configuration creates an EIGRP routing instance that can be used for tagging routing information.

Configuring the **router eigrp** command with the *virtual-instance-name* argument creates an EIGRP configuration referred to as EIGRP named configuration. An EIGRP named configuration does not create an EIGRP routing instance by itself. An EIGRP named configuration is a base configuration that is required to define address-family configurations under it that are used for routing.

Examples

The following example shows how to configure EIGRP process 109:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp 109
```

The following example configures an EIGRP address-family routing process and assigns it the name *virtual-name*:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name
```

router ospf

To configure an OSPF routing process, use the **router ospf** command in global configuration mode. To terminate an OSPF routing process, use the **no** form of this command.

router ospf *process-id* [**vrf** *vrf-name*]
no router ospf *process-id* [**vrf** *vrf-name*]

Syntax Description

| | |
|----------------------------|--|
| <i>process-id</i> | Internally used identification parameter for an OSPF routing process. It is locally assigned, and can be a positive integer. A unique value is assigned for each OSPF routing process. |
| vrf <i>vrf-name</i> | (Optional) Specifies the name of the VPN routing and forwarding (VRF) instance to associate with the OSPF VRF processes. |

Command Default

No OSPF routing process is defined.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

You can specify multiple OSPF routing processes in each router.

After you enter the **router ospf** command, you can enter the maximum number of paths. There can be between 1 and 32 paths.

Examples

The following example shows how to configure an OSPF routing process and assign a process number of 109:

```
Device(config)# router ospf 109
```

The following example shows a basic OSPF configuration using the **router ospf** command to configure the OSPF VRF instance processes for the first, second, and third VRFs:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 12 vrf first
Device(config)# router ospf 13 vrf second
Device(config)# router ospf 14 vrf third
Device(config)# exit
```

The following example shows how to use the **maximum-paths** option:

```
Device> enable
Device# configure terminal
Device(config)# router ospf
Device(config-router)# maximum-paths 2
Device(config-router)# exit
```

Related Commands

| Command | Description |
|---------------------|--|
| network area | Defines the interfaces on which OSPF runs, and defines the area ID for those interfaces. |

router ospfv3

To enter Open Shortest Path First Version 3 (OSPFv3) through router configuration mode, use the **router ospfv3** command in global configuration mode.

router ospfv3 [*process-id*]

Syntax Description

process-id (Optional) Internal identification. The number that is used here is the number assigned administratively when enabling the OSPFv3 routing process. The range is 1-65535.

Command Default

OSPFv3 routing process is disabled by default.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **router ospfv3** command to enter OSPFv3 router configuration mode. From this mode, you can enter address-family configuration mode for IPv6 or IPv4, and then configure the IPv6 or IPv4 address family.

Examples

The following example shows how to enter OSPFv3 router configuration mode:

```
Device> enable
Device# configure terminal
Device(config)# router ospfv3 1
Device(config-router)#
```

Related Commands

| Command | Description |
|----------------------------|--|
| address-family ipv6 | Enters IPv6 address family configuration mode. |

send-lifetime

To set the time period during which an authentication key on a key chain is valid to be sent, use the **send-lifetime** command in key chain key configuration mode. To revert to the default value, use the **no** form of this command.

```
send-lifetime [ local ] start-time { infinite end-time | duration seconds }
no send-lifetime
```

| Syntax Description | local | Specifies the time in local timezone. |
|--------------------|--------------------------------|--|
| | <i>start-time</i> | Beginning time that the key specified by the key command is valid to be sent. The syntax can be either of the following: <i>hh : mm : ss month date year</i> <i>hh : mm : ss date month year</i> <ul style="list-style-type: none"> • <i>hh</i>: Hours • <i>mm</i>: Minutes • <i>ss</i>: Seconds • <i>month</i>: First three letters of the month • <i>date</i>: Date (1-31) • <i>year</i>: Year (four digits) <p>The default start time and the earliest acceptable date is January 1, 1993.</p> |
| | infinite | Key is valid to be sent from the <i>start-time</i> value on. |
| | <i>end-time</i> | Key is valid to be sent from the <i>start-time</i> value until the <i>end-time</i> value. The syntax is the same as that for the <i>start-time</i> value. The <i>end-time</i> value must be after the <i>start-time</i> value. The default end time is an infinite time period. |
| | duration <i>seconds</i> | Length of time (in seconds) that the key is valid to be sent. The range is from 1 to 2147483646. |

Command Default Forever (the starting time is January 1, 1993, and the ending time is infinite)

Command Modes Key chain key configuration (config-keychain-key)

| Command History | Release | Modification |
|-----------------|-------------------------------|---|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Bengaluru 17.5.1 | The new range of the duration keyword is from 1 to 2147483646. |

Usage Guidelines Specify a *start-time* value and one of the following values: **infinite**, *end-time*, or **duration** *seconds*.

We recommend running Network Time Protocol (NTP) or some other time synchronization method if you intend to set lifetimes on keys.

If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key.

Examples

The following example configures a key chain named chain1. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# interface GigabitEthernet1/0/1
Device(config-if)# ip rip authentication key-chain chain1
Device(config-if)# ip rip authentication mode md5
Device(config-if)# exit
Device(config)# router rip
Device(config-router)# network 172.19.0.0
Device(config-router)# version 2
Device(config-router)# exit
Device(config)# key chain chain1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string key1
Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain)# key-string key2
Device(config-keychain)# accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device(config-keychain)# send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

The following example configures a key chain named chain1 for EIGRP address-family. The key named key1 will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The key named key2 will be accepted from 2:30 p.m. to 4:30 p.m. and be sent from 3:00 p.m. to 4:00 p.m. The overlap allows for migration of keys or a discrepancy in the set time of the router. There is a 30-minute leeway on each side to handle time differences.

```
Device(config)# router eigrp 10
Device(config-router)# address-family ipv4 autonomous-system 4453
Device(config-router-af)# network 10.0.0.0
Device(config-router-af)# af-interface ethernet0/0
Device(config-router-af-interface)# authentication key-chain trees
Device(config-router-af-interface)# authentication mode md5
Device(config-router-af-interface)# exit
Device(config-router-af)# exit
Device(config-router)# exit
Device(config)# key chain chain1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string key1
Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 1996 duration 3600
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain-key)# key-string key2
Device(config-keychain-key)# accept-lifetime 14:30:00 Jan 25 1996 duration 7200
Device(config-keychain-key)# send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

Related Commands

| Command | Description |
|------------------------------------|---|
| accept-lifetime | Sets the time period during which the authentication key on a key chain is received as valid. |
| key | Identifies an authentication key on a key chain. |
| key chain | Defines an authentication key chain needed to enable authentication for routing protocols. |
| key-string (authentication) | Specifies the authentication string for a key. |
| show key chain | Displays authentication key information. |

set community

To set the BGP communities attribute, use the **set community** route map configuration command. To delete the entry, use the **no** form of this command.

set community {*community-number* [**additive**] [*well-known-community*] | **none**}
no set community

Syntax Description

| | |
|-----------------------------|--|
| <i>community-number</i> | Specifies that community number. Valid values are from 1 to 4294967200, no-export , or no-advertise . |
| additive | (Optional) Adds the community to the already existing communities. |
| <i>well-known-community</i> | (Optional) Well know communities can be specified by using the following keywords: <ul style="list-style-type: none"> • internet • local-as • no-advertise • no-export |
| none | (Optional) Removes the community attribute from the prefixes that pass the route map. |

Command Default

No BGP communities attributes exist.

Command Modes

Route-map configuration (config-route-map)

Command History

Table 161:

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

You must have a match clause (even if it points to a “permit everything” list) if you want to set tags.

Use the **route-map** global configuration command, and the **match** and **set** route map configuration commands, to define the conditions for redistributing routes from one routing protocol into another. Each **route-map** command has a list of **match** and **set** commands associated with it. The **match** commands specify the *match criteria* --the conditions under which redistribution is allowed for the current **route-map** command. The **set** commands specify the *set actions* --the particular redistribution actions to perform if the criteria enforced by the **match** commands are met. The **no route-map** command deletes the route map.

The **set** route map configuration commands specify the redistribution *set actions* to be performed when all of the match criteria of a route map are met. When all match criteria are met, all set actions are performed.

Examples

In the following example, routes that pass the autonomous system path access list 1 have the community set to 109. Routes that pass the autonomous system path access list 2 have the community set to no-export (these routes will not be advertised to any external BGP [eBGP] peers).

```
route-map set_community 10 permit
match as-path 1
set community 109
route-map set_community 20 permit
match as-path 2
set community no-export
```

In the following similar example, routes that pass the autonomous system path access list 1 have the community set to 109. Routes that pass the autonomous system path access list 2 have the community set to local-as (the router will not advertise this route to peers outside the local autonomous system).

```
route-map set_community 10 permit
match as-path 1
set community 109
route-map set_community 20 permit
match as-path 2
set community local-as
```

Related Commands

| Command | Description |
|------------------------------|---|
| ip community-list | Creates a community list for BGP and control access to it. |
| match community | Matches a BGP community. |
| route-map (IP) | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing. |
| set comm-list delete | Removes communities from the community attribute of an inbound or outbound update. |
| show ip bgp community | Displays routes that belong to specified BGP communities. |

set ip next-hop (BGP)

To indicate where to output packets that pass a match clause of a route map for policy routing, use the **set ip next-hop** command in route-map configuration mode. To delete an entry, use the **no** form of this command.

```
set ip next-hop ip-address[ {...ip-address} ][ {peer-address} ]
no set ip next-hop ip-address[ {...ip-address} ][ {peer-address} ]
```

Syntax Description

| | |
|---------------------|--|
| <i>ip-address</i> | IP address of the next hop to which packets are output. It need not be an adjacent router. |
| peer-address | (Optional) Sets the next hop to be the BGP peering address. |

Command Default

This command is disabled by default.

Command Modes

Route-map configuration (config-route-map)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

An ellipsis (...) in the command syntax indicates that your command input can include multiple values for the *ip-address* argument.

Use the **ip policy route-map** interface configuration command, the **route-map** global configuration command, and the **match** and **set** route-map configuration commands to define the conditions for policy routing packets. The **ip policy route-map** command identifies a route map by name. Each **route-map** command has a list of **match** and **set** commands associated with it. The **match** commands specify the *match criteria* --the conditions under which policy routing occurs. The **set** commands specify the *set actions* --the particular routing actions to perform if the criteria enforced by the **match** commands are met.

If the first next hop specified with the **set ip next-hop** command is down, the optionally specified IP addresses are tried in turn.

When the **set ip next-hop** command is used with the **peer-address** keyword in an inbound route map of a BGP peer, the next hop of the received matching routes will be set to be the neighbor peering address, overriding any third-party next hops. So the same route map can be applied to multiple BGP peers to override third-party next hops.

When the **set ip next-hop** command is used with the **peer-address** keyword in an outbound route map of a BGP peer, the next hop of the advertised matching routes will be set to be the peering address of the local router, thus disabling the next hop calculation. The **set ip next-hop** command has finer granularity than the (per-neighbor) **neighbor next-hop-self** command, because you can set the next hop for some routes, but not others. The **neighbor next-hop-self** command sets the next hop for all routes sent to that neighbor.

The set clauses can be used in conjunction with one another. They are evaluated in the following order:

1. **set ip next-hop**
2. **set interface**
3. **set ip default next-hop**

4. set default interface

Note To avoid a common configuration error for reflected routes, do not use the **set ip next-hop** command in a route map to be applied to BGP route reflector clients.

Configuring the **set ip next-hop ...ip-address** command on a VRF interface allows the next hop to be looked up in a specified VRF address family. In this context, the *...ip-address* argument matches that of the specified VRF instance.

Examples

In the following example, three routers are on the same FDDI LAN (with IP addresses 10.1.1.1, 10.1.1.2, and 10.1.1.3). Each is in a different autonomous system. The **set ip next-hop peer-address** command specifies that traffic from the router (10.1.1.3) in remote autonomous system 300 for the router (10.1.1.1) in remote autonomous system 100 that matches the route map is passed through the router bgp 200, rather than sent directly to the router (10.1.1.1) in autonomous system 100 over their mutual connection to the LAN.

```
Device(config)#router bgp 200
Device(config)#neighbor 10.1.1.3 remote-as 300
Device(config)#neighbor 10.1.1.3 route-map set-peer-address out
Device(config)#neighbor 10.1.1.1 remote-as 100
Device(config)#route-map set-peer-address permit 10
Device(config)#set ip next-hop peer-address
```

Related Commands

| Command | Description |
|--------------------------------|---|
| ip policy route-map | Identifies a route map to use for policy routing on an interface. |
| match ip address | Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, and performs policy routing on packets. |
| match length | Bases policy routing on the Level 3 length of a packet. |
| neighbor next-hop-self | Disables next hop processing of BGP updates on the router. |
| route-map (IP) | Defines the conditions for redistributing routes from one routing protocol to another, or enables policy routing. |
| set default interface | Indicates where to output packets that pass a match clause of a route map for policy routing and that have no explicit route to the destination. |
| set interface | Indicates where to output packets that pass a match clause of a route map for policy routing. |
| set ip default next-hop | Indicates where to output packets that pass a match clause of a route map for policy routing and for which the Cisco IOS software has no explicit route to a destination. |

show ip bgp

To display entries in the Border Gateway Protocol (BGP) routing table, use the **show ip bgp** command in user EXEC or privileged EXEC mode.

```
show ip bgp [{ip-address [{mask [{longer-prefixes [{injected}] | shorter-prefixes [{length}] |
best-path-reason | bestpath | multipaths | subnets}] | best-path-reason | bestpath | internal |
multipaths}] | all | oer-paths | prefix-list name | pending-prefixes | route-map name | version
{version-number | recent offset-value}]}
```

Syntax Description

| | |
|-------------------------------|--|
| <i>ip-address</i> | (Optional) IP address entered to filter the output to display only a particular host or network in the BGP routing table. |
| <i>mask</i> | (Optional) Mask to filter or match hosts that are part of the specified network. |
| longer-prefixes | (Optional) Displays the specified route and all more-specific routes. |
| injected | (Optional) Displays more-specific prefixes injected into the BGP routing table. |
| shorter-prefixes | (Optional) Displays the specified route and all less-specific routes. |
| <i>length</i> | (Optional) The prefix length. The range is a number from 0 to 32. |
| bestpath | (Optional) Displays the best path for this prefix. |
| best-path-reason | (Optional) Displays the reason why a path loses to the bestpath. Note If the best-path is yet to be selected, then the output will be 'Best Path Evaluation: No best path' |
| internal | (Optional) Displays the internal details for this prefix. |
| multipaths | (Optional) Displays multipaths for this prefix. |
| subnets | (Optional) Displays the subnet routes for the specified prefix. |
| all | (Optional) Displays all address family information in the BGP routing table. |
| oer-paths | (Optional) Displays Optimized Edge Routing (OER) controlled prefixes in the BGP routing table. |
| prefix-list name | (Optional) Filters the output based on the specified prefix list. |
| pending-prefixes | (Optional) Displays prefixes that are pending deletion from the BGP routing table. |
| route-map name | (Optional) Filters the output based on the specified route map. |
| version version-number | (Optional) Displays all prefixes with network versions greater than or equal to the specified version number. The range is from 1 to 4294967295. |
| recent offset-value | (Optional) Displays the offset from the current routing table version. The range is from 1 to 4294967295. |

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

| Command History | Release | Modification |
|-----------------|--------------------------------|---|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.10.1 | The best-path-reason keyword was added to this command. BGP Path Installation Time-Stamp was added to the output of the command. BGP Peak Prefix Watermark was added to the output of the command. |

Usage Guidelines

The **show ip bgp** command is used to display the contents of the BGP routing table. The output can be filtered to display entries for a specific prefix, prefix length, and prefixes injected through a prefix list, route map, or conditional advertisement.

When changes are made to the network address, the network version number is incremented. Use the **version** keyword to view a specific network version.

show ip bgp: Example

The following sample output displays the BGP routing table:

```
Device#show ip bgp

BGP table version is 6, local router ID is 10.0.96.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale, m multipath, b backup-path, x best-external, f
RT-Filter, a additional-path
Origin codes: i - IGP, e - EGP, ? - incomplete
RPKI validation codes: V valid, I invalid, N Not found

The table below describes the significant fields shown in the display.

Table 162: show ip bgp Field Descriptions

| Field | Description |
|-----------------------|---|
| BGP table version | Internal version number of the table. This number is incremented whenever the table changes. |
| local router ID | IP address of the router. |
| Status codes | <p>Status of the table entry. The status is displayed at the beginning of each line in the table. It can be one of the following values:</p> <ul style="list-style-type: none"> • s—The table entry is suppressed. • d—The table entry is dampened. • h—The table entry history. • *—The table entry is valid. • >—The table entry is the best entry to use for that network. • i—The table entry was learned via an internal BGP (iBGP) session. • r—The table entry is a RIB-failure. • S—The table entry is stale. • m—The table entry has multipath to use for that network. • b—The table entry has a backup path to use for that network. • x—The table entry has a best external route to use for the network. |
| Origin codes | <p>Origin of the entry. The origin code is placed at the end of each line in the table. It can be one of the following values:</p> <ul style="list-style-type: none"> • a—Path is selected as an additional path. • i—Entry originated from an Interior Gateway Protocol (IGP) and was advertised with a network router configuration command. • e—Entry originated from an Exterior Gateway Protocol (EGP). • ?—Origin of the path is not clear. Usually, this is a router that is redistributed into BGP from an IGP. |
| RPKI validation codes | If shown, the RPKI validation state for the network prefix, which is downloaded from the RPKI server. The codes are shown only if the bgp rpki server or neighbor announce rpki state command is configured. |
| Network | IP address of a network entity. |
| Next Hop | IP address of the next system that is used when forwarding a packet to the destination network. An entry of 0.0.0.0 indicates that the router has some non-BGP routes to this network. |
| Metric | If shown, the value of the interautonomous system metric. |

| Field | Description |
|------------|--|
| LocPrf | Local preference value as set with the set local-preference route-map configuration command. The default value is 100. |
| Weight | Weight of the route as set via autonomous system filters. |
| Path | Autonomous system paths to the destination network. There can be one entry in this field for each autonomous system in the path. |
| (stale) | Indicates that the following path for the specified autonomous system is marked as “stale” during a graceful restart process. |
| Updated on | The time at which the path is received or updated. |

show ip bgp (4-Byte Autonomous System Numbers): Example

The following sample output shows the BGP routing table with 4-byte autonomous system numbers, 65536 and 65550, shown under the Path field. This example requires Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SX11, Cisco IOS XE Release 2.4, or a later release.

```
Device#show ip bgp
```

```
BGP table version is 4, local router ID is 172.16.1.99
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop           Metric LocPrf Weight Path
*> 10.1.1.0/24    192.168.1.2         0           0 65536 i
*> 10.2.2.0/24    192.168.3.2         0           0 65550 i
*> 172.16.1.0/24  0.0.0.0             0           32768 i
```

show ip bgp network: Example

The following sample output displays information about the 192.168.1.0 entry in the BGP routing table:

```
Device#show ip bgp 192.168.1.0
```

```
BGP routing table entry for 192.168.1.0/24, version 22
Paths: (2 available, best #2, table default)
  Additional-path
  Advertised to update-groups:
    3
  10 10
    192.168.3.2 from 172.16.1.2 (10.2.2.2)
      Origin IGP, metric 0, localpref 100, valid, internal, backup/repair
  10 10
    192.168.1.2 from 192.168.1.2 (10.3.3.3)
      Origin IGP, localpref 100, valid, external, best , recursive-via-connected
```

The following sample output displays information about the 10.3.3.3 255.255.255.255 entry in the BGP routing table:

```

Device#show ip bgp 10.3.3.3 255.255.255.255

BGP routing table entry for 10.3.3.3/32, version 35
Paths: (3 available, best #2, table default)
Multipath: eBGP
Flag: 0x860
  Advertised to update-groups:
    1
  200
    10.71.8.165 from 10.71.8.165 (192.168.0.102)
      Origin incomplete, localpref 100, valid, external, backup/repair
      Only allowed to recurse through connected route
  200
    10.71.11.165 from 10.71.11.165 (192.168.0.102)
      Origin incomplete, localpref 100, weight 100, valid, external, best
      Only allowed to recurse through connected route
  200
    10.71.10.165 from 10.71.10.165 (192.168.0.104)
      Origin incomplete, localpref 100, valid, external,
      Only allowed to recurse through connected route

```

The table below describes the significant fields shown in the display.

Table 163: show ip bgp ip-address Field Descriptions

| Field | Description |
|-----------------------------|---|
| BGP routing table entry for | IP address or network number of the routing table entry. |
| version | Internal version number of the table. This number is incremented whenever the table changes. |
| Paths | The number of available paths, and the number of installed best paths. This line displays “Default-IP-Routing-Table” when the best path is installed in the IP routing table. |
| Multipath | This field is displayed when multipath load sharing is enabled. This field will indicate if the multipaths are iBGP or eBGP. |
| Advertised to update-groups | The number of each update group for which advertisements are processed. |
| Origin | Origin of the entry. The origin can be IGP, EGP, or incomplete. This line displays the configured metric (0 if no metric is configured), the local preference value (100 is default), and the status and type of route (internal, external, multipath, best). |
| Extended Community | This field is displayed if the route carries an extended community attribute. The attribute code is displayed on this line. Information about the extended community is displayed on a subsequent line. |

show ip bgp all: Example

The following is sample output from the **show ip bgp** command entered with the **all** keyword. Information about all configured address families is displayed.

Device#show ip bgp all

For address family: IPv4 Unicast *****

Related Commands

| Command | Description |
|------------------------------------|--|
| bgp asnotation dot | Changes the default display and the regular expression match format of BGP 4-byte autonomous system numbers from asplain (decimal values) to dot notation. |
| clear ip bgp | Resets BGP connections using hard or soft reconfiguration. |
| ip bgp community new-format | Configures BGP to display communities in the format AA:NN. |
| ip prefix-list | Creates a prefix list or adds a prefix-list entry. |
| route-map | Defines the conditions for redistributing routes from one routing protocol into another routing protocol. |
| router bgp | Configures the BGP routing process. |

show ip bgp neighbors

To display information about Border Gateway Protocol (BGP) and TCP connections to neighbors, use the **show ip bgp neighbors** command in user or privileged EXEC mode.

```
show ip bgp [{ipv4 {multicast|unicast}|vpnv4 all|vpnv6 unicast all}] neighbors [{slowip-address
|ipv6-address [{advertised-routes|dampened-routes|flap-statistics|paths [reg-exp]|policy [detail]
|received prefix-filter|received-routes|routes}}}]
```

Syntax Description

| | |
|-------------------------------|---|
| ipv4 | (Optional) Displays peers in the IPv4 address family. |
| multicast | (Optional) Specifies IPv4 multicast address prefixes. |
| unicast | (Optional) Specifies IPv4 unicast address prefixes. |
| vpnv4 all | (Optional) Displays peers in the VPNv4 address family. |
| vpnv6 unicast all | (Optional) Displays peers in the VPNv6 address family. |
| slow | (Optional) Displays information about dynamically configured slow peers. |
| <i>ip-address</i> | (Optional) IP address of the IPv4 neighbor. If this argument is omitted, information about all neighbors is displayed. |
| <i>ipv6-address</i> | (Optional) IP address of the IPv6 neighbor. |
| advertised-routes | (Optional) Displays all routes that have been advertised to neighbors. |
| dampened-routes | (Optional) Displays the dampened routes received from the specified neighbor. |
| flap-statistics | (Optional) Displays the flap statistics of the routes learned from the specified neighbor (for external BGP peers only). |
| paths <i>reg-exp</i> | (Optional) Displays autonomous system paths learned from the specified neighbor. An optional regular expression can be used to filter the output. |
| policy | (Optional) Displays the policies applied to this neighbor per address family. |
| detail | (Optional) Displays detailed policy information such as route maps, prefix lists, community lists, access control lists (ACLs), and autonomous system path filter lists. |
| received prefix-filter | (Optional) Displays the prefix list (outbound route filter [ORF]) sent from the specified neighbor. |
| received-routes | (Optional) Displays all received routes (both accepted and rejected) from the specified neighbor. |
| routes | (Optional) Displays all routes that are received and accepted. The output displayed when this keyword is entered is a subset of the output displayed by the received-routes keyword. |

Command Default The output of this command displays information for all neighbors.

Command Modes User EXEC (>)
Privileged EXEC (#)

Command History

| Command History | Release | Modification |
|-----------------|--------------------------------|--|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.10.1 | BGP Peak Prefix Watermark was added to the command output. |

Usage Guidelines

Use the **show ip bgp neighbors** command to display BGP and TCP connection information for neighbor sessions. For BGP, this includes detailed neighbor attribute, capability, path, and prefix information. For TCP, this includes statistics related to BGP neighbor session establishment and maintenance.

Prefix activity is displayed based on the number of prefixes that are advertised and withdrawn. Policy denials display the number of routes that were advertised but then ignored based on the function or attribute that is displayed in the output.

Examples

Example output is different for the various keywords available for the **show ip bgp neighbors** command. Examples using the various keywords appear in the following sections.

show ip bgp neighbors: Example

The following example shows output for the BGP neighbor at 10.108.50.2. This neighbor is an internal BGP (iBGP) peer. This neighbor supports the route refresh and graceful restart capabilities.

```
Device#show ip bgp neighbors 10.108.50.2

BGP neighbor is 10.108.50.2, remote AS 1, internal link
  BGP version 4, remote router ID 192.168.252.252
  BGP state = Established, up for 00:24:25
  Last read 00:00:24, last write 00:00:24, hold time is 180, keepalive interval is
    60 seconds
  Neighbor capabilities:
    Route refresh: advertised and received(old & new)
    MPLS Label capability: advertised and received
    Graceful Restart Capability: advertised
    Address family IPv4 Unicast: advertised and received
  Message statistics:
    InQ depth is 0
    OutQ depth is 0

                Sent          Rcvd
  Opens:                3            3
  Notifications:        0            0
  Updates:               0            0
  Keepalives:           113          112
  Route Refresh:         0            0
  Total:                 116          115
  Default minimum time between advertisement runs is 5 seconds
  For address family: IPv4 Unicast
  BGP additional-paths computation is enabled
```

```

BGP advertise-best-external is enabled

```

The table below describes the significant fields shown in the display. Fields that are preceded by the asterisk character (*) are displayed only when the counter has a nonzero value.

Table 164: show ip bgp neighbors Field Descriptions

| Field | Description |
|--|--|
| BGP neighbor | IP address of the BGP neighbor and its autonomous system number. |
| remote AS | Autonomous system number of the neighbor. |
| local AS 300 no-prepend (not shown in display) | Verifies that the local autonomous system number is not prepended to received external routes. This output supports the hiding of the local autonomous systems when a network administrator is migrating autonomous systems. |

| Field | Description |
|-----------------------------|--|
| internal link | “internal link” is displayed for iBGP neighbors; “external link” is displayed for external BGP (eBGP) neighbors. |
| BGP version | BGP version being used to communicate with the remote router. |
| remote router ID | IP address of the neighbor. |
| BGP state | Finite state machine (FSM) stage of session negotiation. |
| up for | Time, in hh:mm:ss, that the underlying TCP connection has been in existence. |
| Last read | Time, in hh:mm:ss, since BGP last received a message from this neighbor. |
| last write | Time, in hh:mm:ss, since BGP last sent a message to this neighbor. |
| hold time | Time, in seconds, that BGP will maintain the session with this neighbor without receiving messages. |
| keepalive interval | Time interval, in seconds, at which keepalive messages are transmitted to this neighbor. |
| Neighbor capabilities | BGP capabilities advertised and received from this neighbor. “advertised and received” is displayed when a capability is successfully exchanged between two routers. |
| Route refresh | Status of the route refresh capability. |
| MPLS Label capability | Indicates that MPLS labels are both sent and received by the eBGP peer. |
| Graceful Restart Capability | Status of the graceful restart capability. |
| Address family IPv4 Unicast | IP Version 4 unicast-specific properties of this neighbor. |
| Message statistics | Statistics organized by message type. |
| InQ depth is | Number of messages in the input queue. |
| OutQ depth is | Number of messages in the output queue. |
| Sent | Total number of transmitted messages. |
| Revd | Total number of received messages. |
| Opens | Number of open messages sent and received. |
| Notifications | Number of notification (error) messages sent and received. |
| Updates | Number of update messages sent and received. |
| Keepalives | Number of keepalive messages sent and received. |

| Field | Description |
|---------------------------------|---|
| Route Refresh | Number of route refresh request messages sent and received. |
| Total | Total number of messages sent and received. |
| Default minimum time between... | Time, in seconds, between advertisement transmissions. |
| For address family: | Address family to which the following fields refer. |
| BGP table version | Internal version number of the table. This is the primary routing table with which the neighbor has been updated. The number increments when the table changes. |
| neighbor version | Number used by the software to track prefixes that have been sent and those that need to be sent. |
| 1 update-group member | Number of the update-group member for this address family. |
| Prefix activity | Prefix statistics for this address family. |
| Prefixes Current | Number of prefixes accepted for this address family. |
| Prefixes Total | Total number of received prefixes. |
| Implicit Withdraw | Number of times that a prefix has been withdrawn and readvertised. |
| Explicit Withdraw | Number of times that a prefix has been withdrawn because it is no longer feasible. |
| Used as bestpath | Number of received prefixes installed as best paths. |
| Used as multipath | Number of received prefixes installed as multipaths. |
| * Saved (soft-reconfig) | Number of soft resets performed with a neighbor that supports soft reconfiguration. This field is displayed only if the counter has a nonzero value. |
| * History paths | This field is displayed only if the counter has a nonzero value. |
| * Invalid paths | Number of invalid paths. This field is displayed only if the counter has a nonzero value. |
| Local Policy Denied Prefixes | Prefixes denied due to local policy configuration. Counters are updated for inbound and outbound policy denials. The fields under this heading are displayed only if the counter has a nonzero value. |
| * route-map | Displays inbound and outbound route-map policy denials. |
| * filter-list | Displays inbound and outbound filter-list policy denials. |
| * prefix-list | Displays inbound and outbound prefix-list policy denials. |
| * Ext Community | Displays only outbound extended community policy denials. |
| * AS_PATH too long | Displays outbound AS_PATH length policy denials. |

| Field | Description |
|---|---|
| * AS_PATH loop | Displays outbound AS_PATH loop policy denials. |
| * AS_PATH confed info | Displays outbound confederation policy denials. |
| * AS_PATH contains AS 0 | Displays outbound denials of autonomous system 0. |
| * NEXT_HOP Martian | Displays outbound martian denials. |
| * NEXT_HOP non-local | Displays outbound nonlocal next-hop denials. |
| * NEXT_HOP is us | Displays outbound next-hop-self denials. |
| * CLUSTER_LIST loop | Displays outbound cluster-list loop denials. |
| * ORIGINATOR loop | Displays outbound denials of local originated routes. |
| * unsuppress-map | Displays inbound denials due to an unsuppress map. |
| * advertise-map | Displays inbound denials due to an advertise map. |
| * VPN Imported prefix | Displays inbound denials of VPN prefixes. |
| * Well-known Community | Displays inbound denials of well-known communities. |
| * SOO loop | Displays inbound denials due to site-of-origin. |
| * Bestpath from this peer | Displays inbound denials because the best path came from the local router. |
| * Suppressed due to dampening | Displays inbound denials because the neighbor or link is in a dampening state. |
| * Bestpath from iBGP peer | Displays inbound denials because the best path came from an iBGP neighbor. |
| * Incorrect RIB for CE | Displays inbound denials due to RIB errors for a customer edge (CE) router. |
| * BGP distribute-list | Displays inbound denials due to a distribute list. |
| Number of NLRIs... | Number of network layer reachability attributes in updates. |
| Current session network count peaked... | Displays the peak number of networks observed in the current session. |
| Highest network count observed at... | Displays the peak number of networks observed since startup. |
| Connections established | Number of times a TCP and BGP connection has been successfully established. |
| dropped | Number of times that a valid session has failed or been taken down. |
| Last reset | Time, in hh:mm:ss, since this peering session was last reset. The reason for the reset is displayed on this line. |

| Field | Description |
|--|--|
| External BGP neighbor may be... | Indicates that the BGP time to live (TTL) security check is enabled. The maximum number of hops that can separate the local and remote peer is displayed on this line. |
| Connection state | Connection status of the BGP peer. |
| unread input bytes | Number of bytes of packets still to be processed. |
| Connection is ECN Disabled | Explicit congestion notification status (enabled or disabled). |
| Local host: 10.108.50.1, Local port: 179 | IP address of the local BGP speaker. BGP port number 179. |
| Foreign host: 10.108.50.2, Foreign port: 42698 | Neighbor address and BGP destination port number. |
| Enqueued packets for retransmit: | Packets queued for retransmission by TCP. |
| Event Timers | TCP event timers. Counters are provided for starts and wakeups (expired timers). |
| Retrans | Number of times a packet has been retransmitted. |
| TimeWait | Time waiting for the retransmission timers to expire. |
| AckHold | Acknowledgment hold timer. |
| SendWnd | Transmission (send) window. |
| KeepAlive | Number of keepalive packets. |
| GiveUp | Number of times a packet is dropped due to no acknowledgment. |
| PmtuAger | Path MTU discovery timer. |
| DeadWait | Expiration timer for dead segments. |
| iss: | Initial packet transmission sequence number. |
| snduna: | Last transmission sequence number that has not been acknowledged. |
| sndnxt: | Next packet sequence number to be transmitted. |
| sndwnd: | TCP window size of the remote neighbor. |
| irs: | Initial packet receive sequence number. |
| rcvnxt: | Last receive sequence number that has been locally acknowledged. |
| revwnd: | TCP window size of the local host. |

| Field | Description |
|----------------------|--|
| delrcvwnd: | Delayed receive window—data the local host has read from the connection, but has not yet subtracted from the receive window the host has advertised to the remote host. The value in this field gradually increases until it is higher than a full-sized packet, at which point it is applied to the rcvwnd field. |
| SRTT: | A calculated smoothed round-trip timeout. |
| RTTO: | Round-trip timeout. |
| RTV: | Variance of the round-trip time. |
| KRTT: | New round-trip timeout (using the Karn algorithm). This field separately tracks the round-trip time of packets that have been re-sent. |
| minRTT: | Shortest recorded round-trip timeout (hard-wire value used for calculation). |
| maxRTT: | Longest recorded round-trip timeout. |
| ACK hold: | Length of time the local host will delay an acknowledgment to carry (piggyback) additional data. |
| IP Precedence value: | IP precedence of the BGP packets. |
| Datagrams | Number of update packets received from a neighbor. |
| Rcvd: | Number of received packets. |
| out of order: | Number of packets received out of sequence. |
| with data | Number of update packets sent with data. |
| total data bytes | Total amount of data received, in bytes. |
| Sent | Number of update packets sent. |
| Second Congestion | Number of update packets with data sent. |
| Datagrams: Rcvd | Number of update packets received from a neighbor. |
| retransmit | Number of packets retransmitted. |
| fastretransmit | Number of duplicate acknowledgments retransmitted for an out of order segment before the retransmission timer expires. |
| partialack | Number of retransmissions for partial acknowledgments (transmissions before or without subsequent acknowledgments). |
| Second Congestion | Number of second retransmissions sent due to congestion. |

show ip bgp neighbors (4-Byte Autonomous System Numbers)

The following partial example shows output for several external BGP neighbors in autonomous systems with 4-byte autonomous system numbers, 65536 and 65550. This example requires Cisco IOS Release 12.0(32)SY8, 12.0(33)S3, 12.2(33)SRE, 12.2(33)XNE, 12.2(33)SXII, Cisco IOS XE Release 2.4, or a later release.

```
Device#show ip bgp neighbors

BGP neighbor is 192.168.1.2, remote AS 65536, external link
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Idle
  Last read 02:03:38, last write 02:03:38, hold time is 120, keepalive interval is 70
seconds
  Configured hold time is 120, keepalive interval is 70 seconds
  Minimum holdtime from neighbor is 0 seconds
.
.
.
BGP neighbor is 192.168.3.2, remote AS 65550, external link
  Description: finance
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Idle
  Last read 02:03:48, last write 02:03:48, hold time is 120, keepalive interval is 70
seconds
  Configured hold time is 120, keepalive interval is 70 seconds
  Minimum holdtime from neighbor is 0 seconds
```

show ip bgp neighbors advertised-routes

The following example displays routes advertised for only the 172.16.232.178 neighbor:

```
Device#show ip bgp neighbors 172.16.232.178 advertised-routes

BGP table version is 27, local router ID is 172.16.232.181
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete
Network          Next Hop          Metric LocPrf Weight Path
*>i10.0.0.0      172.16.232.179    0      100      0 ?
*> 10.20.2.0     10.0.0.0          0              32768 i
```

The table below describes the significant fields shown in the display.

Table 165: show ip bgp neighbors advertised-routes Field Descriptions

| Field | Description |
|-------------------|---|
| BGP table version | Internal version number of the table. This is the primary routing table with which the neighbor has been updated. The number increments when the table changes. |
| local router ID | IP address of the local BGP speaker. |

| Field | Description |
|--------------|--|
| Status codes | Status of the table entry. The status is displayed at the beginning of each line in the table. It can be one of the following values: <ul style="list-style-type: none"> • s—The table entry is suppressed. • d—The table entry is dampened and will not be advertised to BGP neighbors. • h—The table entry does not contain the best path based on historical information. • *—The table entry is valid. • >—The table entry is the best entry to use for that network. • i—The table entry was learned via an internal BGP (iBGP) session. |
| Origin codes | Origin of the entry. The origin code is placed at the end of each line in the table. It can be one of the following values: <ul style="list-style-type: none"> • i—Entry originated from Interior Gateway Protocol (IGP) and was advertised with a network router configuration command. • e—Entry originated from Exterior Gateway Protocol (EGP). • ?—Origin of the path is not clear. Usually, this is a route that is redistributed into BGP from an IGP. |
| Network | IP address of a network entity. |
| Next Hop | IP address of the next system used to forward a packet to the destination network. An entry of 0.0.0.0 indicates that there are non-BGP routes in the path to the destination network. |
| Metric | If shown, this is the value of the interautonomous system metric. This field is not used frequently. |
| LocPrf | Local preference value as set with the set local-preference route-map configuration command. The default value is 100. |
| Weight | Weight of the route as set via autonomous system filters. |
| Path | Autonomous system paths to the destination network. There can be one entry in this field for each autonomous system in the path. |

show ip bgp neighbors check-control-plane-failure

The following is sample output from the **show ip bgp neighbors** command entered with the **check-control-plane-failure** option configured:

```
Device#show ip bgp neighbors 10.10.10.1

BGP neighbor is 10.10.10.1, remote AS 10, internal link
  Fall over configured for session
  BFD is configured. BFD peer is Up. Using BFD to detect fast fallover (single-hop) with
  c-bit check-control-plane-failure.
```

```
Inherits from template cbit-tps for session parameters
BGP version 4, remote router ID 10.7.7.7
BGP state = Established, up for 00:03:55
Last read 00:00:02, last write 00:00:21, hold time is 180, keepalive interval is 60 seconds

Neighbor sessions:
  1 active, is not multisession capable (disabled)
Neighbor capabilities:
  Route refresh: advertised and received(new)
  Four-octets ASN Capability: advertised and received
  Address family IPv4 Unicast: advertised and received
  Enhanced Refresh Capability: advertised and received
  Multisession Capability:
  Stateful switchover support enabled: NO for session 1
```

show ip bgp neighbors paths

The following is sample output from the **show ip bgp neighbors** command entered with the **paths** keyword:

```
Device#show ip bgp neighbors 172.29.232.178 paths 10

Address      Refcount Metric Path
0x60E577B0      2      40 10 ?
```

The table below describes the significant fields shown in the display.

Table 166: show ip bgp neighbors paths Field Descriptions

| Field | Description |
|----------|---|
| Address | Internal address where the path is stored. |
| Refcount | Number of routes using that path. |
| Metric | Multi Exit Discriminator (MED) metric for the path. (The name of this metric for BGP versions 2 and 3 is INTER_AS.) |
| Path | Autonomous system path for that route, followed by the origin code for that route. |

show ip bgp neighbors received prefix-filter

The following example shows that a prefix list that filters all routes in the 10.0.0.0 network has been received from the 192.168.20.72 neighbor:

```
Device#show ip bgp neighbors 192.168.20.72 received prefix-filter

Address family:IPv4 Unicast
ip prefix-list 192.168.20.72:1 entries
  seq 5 deny 10.0.0.0/8 le 32
```

The table below describes the significant fields shown in the display.

Table 167: show ip bgp neighbors received prefix-filter Field Descriptions

| Field | Description |
|----------------|---|
| Address family | Address family mode in which the prefix filter is received. |
| ip prefix-list | Prefix list sent from the specified neighbor. |

show ip bgp neighbors policy

The following sample output shows the policies applied to the neighbor at 192.168.1.2. The output displays both inherited policies and policies configured on the neighbor device. Inherited policies are policies that the neighbor inherits from a peer group or a peer-policy template.

```
Device#show ip bgp neighbors 192.168.1.2 policy

Neighbor: 192.168.1.2, Address-Family: IPv4 Unicast
Locally configured policies:
  route-map ROUTE in
Inherited policies:
  prefix-list NO-MARKETING in
  route-map ROUTE in
  weight 300
  maximum-prefix 10000
```

BGP Attribute Filter and Enhanced Attribute Error Handling

The following is sample output from the **show ip bgp neighbors** command that indicates the discard attribute values and treat-as-withdraw attribute values configured. It also provides a count of received Updates matching a treat-as-withdraw attribute, a count of received Updates matching a discard attribute, and a count of received malformed Updates that are treat-as-withdraw.

```
Device#show ip bgp vpnv4 all neighbors 10.0.103.1

BGP neighbor is 10.0.103.1, remote AS 100, internal link
Path-attribute treat-as-withdraw inbound
Path-attribute treat-as-withdraw value 128
Path-attribute treat-as-withdraw 128 in: count 2
Path-attribute discard 128 inbound
Path-attribute discard 128 in: count 2

      Outbound   Inbound
Local Policy Denied Prefixes:  -----  -----
MALFORM treat as withdraw:           0          1
Total:                               0          1
```

BGP Additional Paths

The following output indicates that the neighbor is capable of advertising additional paths and sending additional paths it receives. It is also capable of receiving additional paths and advertised paths.

```
Device#show ip bgp neighbors 10.108.50.2
```

```

BGP neighbor is 10.108.50.2, remote AS 1, internal link
BGP version 4, remote router ID 192.168.252.252
BGP state = Established, up for 00:24:25
Last read 00:00:24, last write 00:00:24, hold time is 180, keepalive interval is 60 seconds

Neighbor capabilities:
  Additional paths Send: advertised and received
  Additional paths Receive: advertised and received
  Route refresh: advertised and received(old & new)
  Graceful Restart Capabilty: advertised and received
  Address family IPv4 Unicast: advertised and received

```

BGP—Multiple Cluster IDs

In the following output, the cluster ID of the neighbor is displayed. (The vertical bar and letter “i” for “include” cause the device to display only lines that include the user's input after the “i”, in this case, “cluster-id.”) The cluster ID displayed is the one directly configured through a neighbor or a template.

```

Device#show ip bgp neighbors 192.168.2.2 | i cluster-id

Configured with the cluster-id 192.168.15.6

```

BGP Peak Prefix Watermark

The following sample output shows the peak watermarks and their timestamps displayed for the peak number of route entries per neighbor bases:

```

Device#show ip bgp ipv4 unicast neighbors 11.11.11.11

BGP neighbor is 11.11.11.11, remote AS 1, internal link
BGP version 4, remote router ID 0.0.0.0
BGP state = Idle, down for 00:01:43
Neighbor sessions:
  0 active, is not multisesion capable (disabled)
  Stateful switchover support enabled: NO
Do log neighbor state changes (via global configuration)
Default minimum time between advertisement runs is 0 seconds

```

```

For address family: IPv4 Unicast
BGP table version 27, neighbor version 1/27
Output queue size : 0
Index 0, Advertise bit 0
Slow-peer detection is disabled
Slow-peer split-update-group dynamic is disabled

```

| Prefix activity: | Sent | Rcvd |
|--------------------|------|------|
| Prefixes Current: | 0 | 0 |
| Prefixes Total: | 0 | 0 |
| Implicit Withdraw: | 0 | 0 |
| Explicit Withdraw: | 0 | 0 |
| Used as bestpath: | n/a | 0 |
| Used as multipath: | n/a | 0 |
| Used as secondary: | n/a | 0 |

| | Outbound | Inbound |
|-------------------------------|----------|---------|
| Local Policy Denied Prefixes: | ----- | ----- |
| Total: | 0 | 0 |

```

Number of NLRI in the update sent: max 2, min 0

```

```

Current session network count peaked at 20 entries at 00:00:23 Aug 8 2018 PST (00:01:29.156
ago).
Highest network count observed at 20 entries at 23:55:32 Aug 7 2018 PST (00:06:20.156
ago).

Related Commands

| Command | Description |
|--|--|
| bgp asnotation dot | Changes the default display and the regular expression match format of BGP 4-byte autonomous system numbers from asplain (decimal values) to dot notation. |
| bgp enhanced-error | Restores the default behavior of treating Update messages that have a malformed attribute as withdrawn, or includes iBGP peers in the Enhanced Attribute Error Handling feature. |
| neighbor path-attribute discard | Configures the device to discard unwanted Update messages from the specified neighbor that contain a specified path attribute. |
| neighbor path-attribute treat-as-withdraw | Configures the device to withdraw from the specified neighbor unwanted Update messages that contain a specified attribute. |
| neighbor send-label | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. |
| neighbor send-label explicit-null | Enables a BGP router to send MPLS labels with explicit-null information for a CSC-CE router and BGP routes to a neighboring CSC-PE router. |
| router bgp | Configures the BGP routing process. |

show ip bgp ipv6 unicast

To display entries in the Internet Protocol version 6 (IPv6) Border Gateway Protocol (BGP) routing table, use the **show ip bgp ipv6 unicast** command in user EXEC or privileged EXEC mode.

```
show ip bgp ipv6 unicast [ prefix / length ]
```

| | |
|---------------------------|--|
| Syntax Description | <p><i>prefix /length</i> (Optional) IPv6 network number and length of the IPv6 prefix, entered to display a particular network in the IPv6 BGP routing table.</p> <ul style="list-style-type: none"> The <i>length</i> is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
|---------------------------|--|

| | |
|----------------------|--------------------------------------|
| Command Modes | User EXEC (>) Privileged EXEC (#) |
|----------------------|--------------------------------------|

Command History

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **show ip bgp ipv6 unicast** command provides output similar to the **show ip bgp** command, except that it is IPv6 specific.

Examples

The following is sample output from the **show bgp ipv6 unicast prefix/length** command, showing the RPKI state of the path:

```
Device# show bgp ipv6 unicast 2010::1/128

BGP routing table entry for 2010::1/128, version 5
Paths: (1 available, best #1, table default)
  Advertised to update-groups:
    1          2
  Refresh Epoch 1
    3
    2002::1 (FE80::A8BB:CCFF:FE00:300) from 2002::1 (10.0.0.3)
      Origin IGP, metric 0, localpref 100, valid, external, best
      path 079ECBD0 RPKI State not found
```

The table below describes the significant fields shown in the display.

Table 168: show ip bgp ipv6 Field Descriptions

| Field | Description |
|-----------------------------|---|
| BGP routing table entry for | IPv6 prefix and prefix length, internal version number of the table. This number is incremented whenever the table changes. |

| Field | Description |
|--|--|
| Paths: | Number of routes available to destination. |
| Advertised to update-groups: | Update group numbers. |
| 3 | Autonomous system number. |
| 2002::1 (FE80::A8BB:CCFF:FE00:300) from 2002::1 (10.0.0.3) | Address of the neighbor from which the path was received, link local address of the neighbor, from address of the neighbor, BGP router ID of the neighbor. |
| Origin | Indicates the origin of the entry. |
| metric | If shown, the value of the interautonomous system metric. |
| localpref | Local preference value as set with the set local-preference route-map configuration command. The default value is 100. |
| valid | Path is legitimate. |
| external | Path is an External Border Gateway Protocol (EBGP) path. |
| best path | Path is flagged as the best path; number indicates which path in memory. |
| RPKI State | RPKI state of the network prefix shown at the beginning of the output. The state could be valid, invalid, or not found. |

Related Commands

| Command | Description |
|-----------------------|---|
| clear bgp ipv6 | Resets an IPv6 BGP connection or session. |

show ip eigrp interfaces

To display information about interfaces that are configured for the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **show ip eigrp interfaces** command in user EXEC or privileged EXEC mode.

```
show ip eigrp [vrf vrf-name] [autonomous-system-number] interfaces [type number] [{detail}]
```

| Syntax Description | | |
|---------------------------------|--|--|
| vrf <i>vrf-name</i> | (Optional) Displays information about the specified virtual routing and forwarding (VRF) instance. | |
| <i>autonomous-system-number</i> | (Optional) Autonomous system number whose output needs to be filtered. | |
| <i>type</i> | (Optional) Interface type. For more information, use the question mark (?) online help function. | |
| <i>number</i> | (Optional) Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function. | |
| detail | (Optional) Displays detailed information about EIGRP interfaces for a specific EIGRP process. | |

| Command Modes | |
|---------------------|--|
| User EXEC (>) | |
| Privileged EXEC (#) | |

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **show ip eigrp interfaces** command to display active EIGRP interfaces and EIGRP-specific interface settings and statistics. The optional *type number* argument and the **detail** keyword can be entered in any order.

If an interface is specified, only information about that interface is displayed. Otherwise, information about all interfaces on which EIGRP is running is displayed.

If an autonomous system is specified, only the routing process for the specified autonomous system is displayed. Otherwise, all EIGRP processes are displayed.

This command can be used to display information about EIGRP named and EIGRP autonomous system configurations.

This command displays the same information as the **show eigrp address-family interfaces** command. Cisco recommends using the **show eigrp address-family interfaces** command.

Examples

The following is sample output from the **show ip eigrp interfaces** command:

```
Device#show ip eigrp interfaces
EIGRP-IPv4 Interfaces for AS(60)
      Xmit Queue   Mean   Pacing Time   Multicast   Pending
```

```

Interface    Peers    Un/Reliable    SRTT    Un/Reliable    Flow Timer    Routes
Di0          0        0/0            0       11/434         0             0
Et0          1        0/0            337     0/10          0             0
SE0:1.16    1        0/0            10      1/63          103           0
Tu0         1        0/0            330     0/16          0             0

```

The following sample output from the **show ip eigrp interfaces detail** command displays detailed information about all active EIGRP interfaces:

```

Device#show ip eigrp interfaces detail

EIGRP-IPv4 Interfaces for AS(1)
          Xmit Queue    PeerQ          Mean    Pacing Time    Multicast    Pending

Interface    Peers  Un/Reliable  Un/Reliable  SRTT    Un/Reliable    Flow Timer    Routes
Et0/0        1      0/0          0/0          525     0/2            3264          0
Hello-interval is 5, Hold-time is 15
  Split-horizon is enabled
  Next xmit serial <none>
  Packetized sent/expedited: 3/0
  Hello's sent/expedited: 6/2
  Un/reliable mcasts: 0/6  Un/reliable ucasts: 7/4
  Mcast exceptions: 1  CR packets: 1  ACKs suppressed: 0
  Retransmissions sent: 1  Out-of-sequence rcvd: 0
  Topology-ids on interface - 0
  Authentication mode is not set

```

The following sample output from the **show ip eigrp interfaces detail** command displays detailed information about a specific interface on which the **no ip next-hop self** command is configured along with the **no-ecmp-mode** option:

```

Device#show ip eigrp interfaces detail tunnel 0

EIGRP-IPv4 Interfaces for AS(1)
          Xmit Queue    PeerQ          Mean    Pacing Time    Multicast    Pending

Interface    Peers  Un/Reliable  Un/Reliable  SRTT    Un/Reliable    Flow Timer    Routes
Tu0/0        2      0/0          0/0          2       0/0            50            0
Hello-interval is 5, Hold-time is 15
  Split-horizon is disabled
  Next xmit serial <none>
  Packetized sent/expedited: 24/3
  Hello's sent/expedited: 28083/9
  Un/reliable mcasts: 0/19  Un/reliable ucasts: 18/64
  Mcast exceptions: 5  CR packets: 5  ACKs suppressed: 0
  Retransmissions sent: 52  Out-of-sequence rcvd: 2
  Next-hop-self disabled, next-hop info forwarded, ECMP mode Enabled
  Topology-ids on interface - 0
  Authentication mode is not set

```

The table below describes the significant fields shown in the displays.

Table 169: show ip eigrp interfaces Field Descriptions

| Field | Description |
|-----------|---|
| Interface | Interface on which EIGRP is configured. |
| Peers | Number of directly connected EIGRP neighbors. |

| Field | Description |
|---------------------------|--|
| PeerQ Un/Reliable | Number of unreliable and reliable packets queued for transmission to specific peers on the interface. |
| Xmit Queue Un/Reliable | Number of packets remaining in the Unreliable and Reliable transmit queues. |
| Mean SRTT | Mean smooth round-trip time (SRTT) interval (in seconds). |
| Pacing Time Un/Reliable | Pacing time (in seconds) used to determine when EIGRP packets (unreliable and reliable) should be sent out of the interface . |
| Multicast Flow Timer | Maximum number of seconds for which the device will send multicast EIGRP packets. |
| Pending Routes | Number of routes in the transmit queue waiting to be sent. |
| Packetized sent/expedited | Number of EIGRP routes that have been prepared for sending packets to neighbors on an interface, and the number of times multiple routes were stored in a single packet. |
| Hello's sent/expedited | Number of EIGRP hello packets that have been sent on an interface and packets that were expedited. |

Related Commands

| Command | Description |
|---|--|
| show eigrp address-family interfaces | Displays information about address family interfaces configured for EIGRP. |
| show ip eigrp neighbors | Displays neighbors discovered by EIGRP. |

show ip eigrp neighbors

To display neighbors discovered by the Enhanced Interior Gateway Routing Protocol (EIGRP), use the **show ip eigrp neighbors** command in privileged EXEC mode.

show ip eigrp [**vrf** *vrf-name*] [*autonomous-system-number*] **neighbors** [{**static**|**detail**}] [*interface-type interface-number*]

| Syntax Description | | |
|--|--|--|
| vrf <i>vrf-name</i> | (Optional) Displays information about the specified VPN Routing and Forwarding (VRF) instance. | |
| <i>autonomous-system-number</i> | (Optional) Autonomous-system-number-specific output is displayed. | |
| static | (Optional) Displays static neighbors. | |
| detail | (Optional) Displays detailed neighbor information. | |
| <i>interface-type interface-number</i> | (Optional) Interface-specific output is displayed. | |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **show ip eigrp neighbors** command can be used to display information about EIGRP named and EIGRP autonomous-system configurations. Use the **show ip eigrp neighbors** command to display dynamic and static neighbor states. You can use this command for also debugging certain types of transport problems.

This command displays the same information as the **show eigrp address-family neighbors** command. Cisco recommends that you use the **show eigrp address-family neighbors** command.

Examples

The following is sample output from the **show ip eigrp neighbors** command:

```
Device#show ip eigrp neighbors
H   Address                Interface           Hold Uptime    SRTT   RTO  Q  Seq
                               (sec)           (ms)          Cnt  Num
0   10.1.1.2                 Et0/0              13 00:00:03 1996  5000 0  5
2   10.1.1.9                 Et0/0              14 00:02:24  206  5000 0  5
1   10.1.1.2.3              Et0/1              11 00:20:39 2202  5000 0  5
```

The table below describes the significant fields shown in the display.

Table 170: show ip eigrp neighbors Field Descriptions

| Field | Description |
|-----------|---|
| Address | IP address of the EIGRP peer. |
| Interface | Interface on which the router is receiving hello packets from the peer. |

| Field | Description |
|---------|---|
| Hold | Time in seconds for which EIGRP waits to hear from the peer before declaring it down. |
| Uptime | Elapsed time (in hours:minutes: seconds) since the local router first heard from this neighbor. |
| SRTT | Smooth round-trip time. This is the number of milliseconds required for an EIGRP packet to be sent to this neighbor and for the local router to receive an acknowledgment of that packet. |
| RTO | Retransmission timeout (in milliseconds). This is the amount of time the software waits before resending a packet from the retransmission queue to a neighbor. |
| Q Cnt | Number of EIGRP packets (update, query, and reply) that the software is waiting to send. |
| Seq Num | Sequence number of the last update, query, or reply packet that was received from this neighbor. |

The following is sample output from the **show ip eigrp neighbors detail** command:

```
Device#show ip eigrp neighbors detail
EIGRP-IPv4 VR(foo) Address-Family Neighbors for AS(1)
H   Address                Interface      Hold Uptime    SRTT   RTO   Q   Seq
   (sec)                (ms)          Cnt Num
0   192.168.10.1           Gi2/0         12 00:00:21 1600  5000  0  3
  Static neighbor (Lisp Encap)
  Version 8.0/2.0, Retrans: 0, Retries: 0, Prefixes: 1
  Topology-ids from peer - 0
```

The table below describes the significant fields shown in the display.

Table 171: show ip eigrp neighbors detail Field Descriptions

| Field | Description |
|------------|---|
| H | This column lists the order in which a peering session was established with the specified neighbor. The order is specified with sequential numbering starting with 0. |
| Address | IP address of the EIGRP peer. |
| Interface | Interface on which the router is receiving hello packets from the peer. |
| Hold | Time in seconds for which EIGRP waits to hear from the peer before declaring it down. |
| Lisp Encap | Indicates that routes from this neighbor are LISP encapsulated. |
| Uptime | Elapsed time (in hours:minutes: seconds) since the local router first heard from this neighbor. |
| SRTT | Smooth round-trip time. This is the number of milliseconds required for an EIGRP packet to be sent to this neighbor and for the local router to receive an acknowledgment of that packet. |
| RTO | Retransmission timeout (in milliseconds). This is the amount of time the software waits before resending a packet from the retransmission queue to a neighbor. |
| Q Cnt | Number of EIGRP packets (update, query, and reply) that the software is waiting to send. |

| Field | Description |
|---------|--|
| Seq Num | Sequence number of the last update, query, or reply packet that was received from this neighbor. |
| Version | The software version that the specified peer is running. |
| Retrans | Number of times that a packet has been retransmitted. |
| Retries | Number of times an attempt was made to retransmit a packet. |

Related Commands

| Command | Description |
|--|---|
| show eigrp address-family neighbors | Displays neighbors discovered by EIGRP. |

show ip eigrp topology

To display Enhanced Interior Gateway Routing Protocol (EIGRP) topology table entries, use the **show ip eigrp topology** command in user EXEC or privileged EXEC mode.

show ip eigrp topology [{ *network* [{ *mask* }] *prefix* | **active** | **all-links** | **detail-links** | **pending** | **secondary-paths** | **summary** | **zero-successors** }

| Syntax Description | | |
|--------------------|------------------------|--|
| | <i>network</i> | (Optional) Network address. |
| | <i>mask</i> | (Optional) Network mask. |
| | <i>prefix</i> | (Optional) Network prefix in the format < <i>network</i> >/< <i>length</i> >, for example, 192.168.0.0/16. |
| | active | (Optional) Displays all topology entries that are in the active state. |
| | all-links | (Optional) Displays all the entries in the EIGRP topology table (including nonfeasible successor sources). |
| | detail-links | (Optional) Displays all the topology entries with additional details. |
| | pending | (Optional) Displays all the entries in the EIGRP topology table that are either waiting for an update from a neighbor or to reply to a neighbor. |
| | secondary-paths | (Optional) Displays the secondary paths in the topology. |
| | summary | (Optional) Displays a summary of the EIGRP topology table. |
| | zero-successors | (Optional) Displays the available routes that have zero successors. |

Command Default If this command is used without any of the optional keywords, only topology entries with feasible successors are displayed and only feasible paths are shown.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **show ip eigrp topology** command to display topology entries, feasible and nonfeasible paths, metrics, and states. This command can be used without any arguments or keywords to display only topology entries with feasible successors and feasible paths. The **all-links** keyword displays all the paths, whether feasible or not, and the **detail-links** keyword displays additional details about these paths.

Use this command to display information about EIGRP named and EIGRP autonomous system configurations. This command displays the same information as the **show eigrp address-family topology** command. We recommend that you use the **show eigrp address-family topology** command.

Examples

The following is a sample output from the **show ip eigrp topology** command:

```
Device# show ip eigrp topology

EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
       r - Reply status, s - sia status
P 10.0.0.0/8, 1 successors, FD is 409600
   via 192.0.2.1 (409600/128256), Ethernet0/0
P 192.16.1.0/24, 1 successors, FD is 409600
   via 192.0.2.1 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600
   via Summary (281600/0), Null0
P 10.0.1.0/24, 1 successors, FD is 281600
   via Connected, Ethernet0/0
```

The following is a sample output from the **show ip eigrp topology prefix** command, and displays detailed information about a single prefix. The prefix shown is an EIGRP internal route.

```
Device# show ip eigrp topology 10.0.0.0/8

EIGRP-IPv4 VR(vr1) Topology Entry for AS(1)/ID(10.1.1.2) for 10.0.0.0/8
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 82329600, RIB is 643200
Descriptor Blocks:
10.1.1.1 (Ethernet2/0), from 10.1.1.1, Send flag is 0x0
Composite metric is (82329600/163840), route is Internal
Vector metric:
  Minimum bandwidth is 16000 Kbit
  Total delay is 631250000 picoseconds
  Reliability is 255/255
  Load is 1/5
  Minimum MTU is 1500
  Hop count is 1
  Originating router is 10.1.1.1
```

The following is a sample output from the **show ip eigrp topology prefix** command, and displays detailed information about a single prefix. The prefix shown is an EIGRP external route.

```
Device# show ip eigrp topology 192.16.1.0/24

EIGRP-IPv4 Topology Entry for AS(1)/ID(10.0.0.1) for 192.16.1.0/24
State is Passive, Query origin flag is 1, 1 Successor(s), FD is 409600, RIB is 643200
Descriptor Blocks:
192.16.1.0/24 (Ethernet0/0), from 10.0.1.2, Send flag is 0x0
Composite metric is (409600/128256), route is External
Vector metric:
  Minimum bandwidth is 10000 Kbit
  Total delay is 6000 picoseconds
  Reliability is 255/255
  Load is 1/5
  Minimum MTU is 1500
  Hop count is 1
  Originating router is 192.16.1.0/24
External data:
  AS number of route is 0
  External protocol is Connected, external metric is 0
  Administrator tag is 0 (0x00000000)
```

The following is a sample output from the **show ip eigrp topology prefix** command displays Equal Cost Multipath (ECMP) mode information when the **no ip next-hop-self** command is configured without the **no-ecmp-mode** keyword in an EIGRP topology. The ECMP mode provides information

about the path that is being advertised. If there is more than one successor, the top-most path is advertised as the default path over all the interfaces, and ECMP Mode: Advertise by default is displayed in the output. If any path other than the default path is advertised, ECMP Mode: Advertise out <Interface name> is displayed.

The topology table displays entries of routes for a particular prefix. The routes are sorted based on metric, next-hop, and infosource. In a Dynamic Multipoint VPN (DMVPN) scenario, routes with the same metric and next hop are sorted based on infosource. The top route in the ECMP is always advertised.

```
Device# show ip eigrp topology 192.168.10.0/24

EIGRP-IPv4 Topology Entry for AS(1)/ID(10.10.100.100) for 192.168.10.0/24
State is Passive, Query origin flag is 1, 2 Successor(s), FD is 284160
Descriptor Blocks:
 10.100.1.0 (Tunnel0), from 10.100.0.1, Send flag is 0x0
   Composite metric is (284160/281600), route is Internal
   Vector metric:
     Minimum bandwidth is 10000 Kbit
     Total delay is 1100 microseconds
     Reliability is 255/255
     Load is 1/55
     Minimum MTU is 1400
     Hop count is 1
     Originating router is 10.10.1.1
   ECMP Mode: Advertise by default
 10.100.0.2 (Tunnel1), from 10.100.0.2, Send flag is 0X0
   Composite metric is (284160/281600), route is Internal
   Vector metric:
     Minimum bandwidth is 10000 Kbit
     Total delay is 1100 microseconds
     Reliability is 255/255
     Load is 1/55
     Minimum MTU is 1400
     Hop count is 1
     Originating router is 10.10.2.2
   ECMP Mode: Advertise out Tunnel1
```

The following is a sample output from the **show ip eigrp topology all-links** command, and displays all the paths, including those that are not feasible:

```
Device# show ip eigrp topology all-links

EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
       r - reply Status, s - sia Status
P 172.16.1.0/24, 1 successors, FD is 409600, serno 14
   via 10.10.1.2 (409600/128256), Ethernet0/0
   via 10.1.1.4.3 (2586111744/2585599744), Serial3/0, serno 18
```

The following is a sample output from the **show ip eigrp topology detail-links** command, and displays additional details about routes:

```
Device# show ip eigrp topology detail-links

EIGRP-IPv4 Topology Table for AS(1)/ID(10.0.0.1)
Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,
       r - reply Status, s - sia Status
P 10.0.0.0/8, 1 successors, FD is 409600, serno 6
   via 10.10.1.2 (409600/128256), Ethernet0/0
P 172.16.1.0/24, 1 successors, FD is 409600, serno 14
   via 10.10.1.2 (409600/128256), Ethernet0/0
P 10.0.0.0/8, 1 successors, FD is 281600, serno 3
```

```

    via Summary (281600/0), Null0
P 10.1.1.0/24, 1 successors, FD is 281600, serno 1
    via Connected, Ethernet0/0

```

The following table describes the significant fields shown in the above examples:

Table 172: show ip eigrp topology Field Descriptions

| Field | Description |
|------------|---|
| Codes | <p>State of this topology table entry. Passive and Active refer to the EIGRP state with respect to the destination. Update, Query, and Reply refer to the type of packet that is being sent.</p> <ul style="list-style-type: none"> • P - Passive: Indicates that no EIGRP computations are being performed for this route. • A - Active: Indicates that EIGRP computations are being performed for this route. • U - Update: Indicates that a pending update packet is waiting to be sent for this route. • Q - Query: Indicates that a pending query packet is waiting to be sent for this route. • R - Reply: Indicates that a pending reply packet is waiting to be sent for this route. • r - Reply status: Indicates that EIGRP has sent a query for the route and is waiting for a reply from the specified path. • s - sia status: Indicates that the EIGRP query packet is in stuck-in-active (SIA) status. |
| successors | Number of successors. This number corresponds to the number of next hops in the IP routing table. If successors is capitalized, then the route or the next hop is in a transition state. |
| serno | Serial number. |
| FD | Feasible distance. This is the best metric to reach the destination or the best metric that was known when the route became active. This value is used in the feasibility condition check. If the reported distance of the device is less than the feasible distance, the feasibility condition is met and that route becomes a feasible successor. After the software determines that it has a feasible successor, the software need not send a query for that destination. |
| via | Next-hop address that advertises the passive route. |

Related Commands

| Command | Description |
|---|--|
| show eigrp address-family topology | Displays entries in the EIGRP address-family topology table. |

show ip eigrp traffic

To display the number of Enhanced Interior Gateway Routing Protocol (EIGRP) packets sent and received, use the **show ip eigrp traffic** command in privileged EXEC mode.

show ip eigrp [**vrf** {*vrf-name* | *}] [*autonomous-system-number*] **traffic**

| Syntax Description | | |
|---------------------------------|------------|---|
| vrf <i>vrf-name</i> | (Optional) | Displays information about the specified VRF. |
| vrf * | (Optional) | Displays information about all VRFs. |
| <i>autonomous-system-number</i> | (Optional) | Autonomous system number. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command can be used to display information about EIGRP named configurations and EIGRP autonomous-system (AS) configurations.

This command displays the same information as the **show eigrp address-family traffic** command. Cisco recommends using the **show eigrp address-family traffic** command.

Examples

The following is sample output from the **show ip eigrp traffic** command:

```
Device#show ip eigrp traffic
EIGRP-IPv4 Traffic Statistics for AS(60)
Hellos sent/received: 21429/2809
Updates sent/received: 22/17
Queries sent/received: 0/0
Replies sent/received: 0/0
Acks sent/received: 16/13
SIA-Queries sent/received: 0/0
SIA-Replies sent/received: 0/0
Hello Process ID: 204
PDM Process ID: 203
Socket Queue: 0/2000/2/0 (current/max/highest/drops)
Input Queue: 0/2000/2/0 (current/max/highest/drops)
```

The table below describes the significant fields shown in the display.

Table 173: show ip eigrp traffic Field Descriptions

| Field | Description |
|-----------------------|---|
| Hellos sent/received | Number of hello packets sent and received. |
| Updates sent/received | Number of update packets sent and received. |
| Queries sent/received | Number of query packets sent and received. |

| Field | Description |
|---------------------------|---|
| Replies sent/received | Number of reply packets sent and received. |
| Acks sent/received | Number of acknowledgement packets sent and received. |
| SIA-Queries sent/received | Number of stuck in active query packets sent and received. |
| SIA-Replies sent/received | Number of stuck in active reply packets sent and received. |
| Hello Process ID | Hello process identifier. |
| PDM Process ID | Protocol-dependent module IOS process identifier. |
| Socket Queue | The IP to EIGRP Hello Process socket queue counters. |
| Input queue | The EIGRP Hello Process to EIGRP PDM socket queue counters. |

Related Commands

| Command | Description |
|--|---|
| show eigrp address-family traffic | Displays the number of EIGRP packets sent and received. |

show ip ospf

To display general information about Open Shortest Path First (OSPF) routing processes, use the **show ip ospf** command in user EXEC or privileged EXEC mode.

show ip ospf [*process-id*]

Syntax Description

| | |
|-------------------|--|
| <i>process-id</i> | (Optional) Process ID. If this argument is included, only information for the specified routing process is included. |
|-------------------|--|

Command Modes

User EXEC Privileged EXEC

Command History

| Mainline Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output from the **show ip ospf** command when entered without a specific OSPF process ID:

```
Device#show ip ospf

Routing Process "ospf 201" with ID 10.0.0.1 and Domain ID 10.20.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 100 secs
Interface flood pacing timer 55 msec
Retransmission pacing timer 100 msec
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 2. 2 normal 0 stub 0 nssa
External flood list length 0
  Area BACKBONE(0)
    Number of interfaces in this area is 2
    Area has message digest authentication
    SPF algorithm executed 4 times
    Area ranges are
    Number of LSA 4. Checksum Sum 0x29BEB
    Number of opaque link LSA 0. Checksum Sum 0x0
    Number of DCbitless LSA 3
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0
  Area 172.16.26.0
    Number of interfaces in this area is 0
    Area has no authentication
    SPF algorithm executed 1 times
    Area ranges are
      192.168.0.0/16 Passive Advertise
    Number of LSA 1. Checksum Sum 0x44FD
    Number of opaque link LSA 0. Checksum Sum 0x0
    Number of DCbitless LSA 1
```

```

Number of indication LSA 1
Number of DoNotAge LSA 0
Flood list length 0

```

Cisco IOS Release 12.2(18)SXE, 12.0(31)S, and 12.4(4)T

The following is sample output from the **show ip ospf** command to verify that the BFD feature has been enabled for OSPF process 123. The relevant command output is shown in bold in the output.

Device#**show ip ospf**

```

Routing Process "ospf 123" with ID 172.16.10.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Initial SPF schedule delay 5000 msec
Minimum hold time between two consecutive SPF's 10000 msec
Maximum wait time between two consecutive SPF's 10000 msec
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msec
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msec
Retransmission pacing timer 66 msec
Number of external LSA 0. Checksum Sum 0x000000
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
BFD is enabled
  Area BACKBONE(0)
    Number of interfaces in this area is 2
    Area has no authentication
    SPF algorithm last executed 00:00:03.708 ago
    SPF algorithm executed 27 times
    Area ranges are
    Number of LSA 3. Checksum Sum 0x00AEF1
    Number of opaque link LSA 0. Checksum Sum 0x000000
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0

```

The table below describes the significant fields shown in the display.

Table 174: show ip ospf Field Descriptions

| Field | Description |
|---|--|
| Routing process "ospf 201" with ID 10.0.0.1 | Process ID and OSPF router ID. |
| Supports... | Number of types of service supported (Type 0 only). |
| SPF schedule delay | Delay time (in seconds) of SPF calculations. |
| Minimum LSA interval | Minimum interval (in seconds) between link-state advertisements. |

| Field | Description |
|--|---|
| LSA group pacing timer | Configured LSA group pacing timer (in seconds). |
| Interface flood pacing timer | Configured LSA flood pacing timer (in milliseconds). |
| Retransmission pacing timer | Configured LSA retransmission pacing timer (in milliseconds). |
| Number of external LSA | Number of external link-state advertisements. |
| Number of opaque AS LSA | Number of opaque link-state advertisements. |
| Number of DCbitless external and opaque AS LSA | Number of demand circuit external and opaque link-state advertisements. |
| Number of DoNotAge external and opaque AS LSA | Number of do not age external and opaque link-state advertisements. |
| Number of areas in this router is | Number of areas configured for the router. |
| External flood list length | External flood list length. |
| BFD is enabled | BFD has been enabled on the OSPF process. |

The following is an excerpt of output from the **show ip ospf** command when the OSPF Forwarding Address Suppression in Type-5 LSAs feature is configured:

```

Device#show ip ospf
.
.
.
Area 2
  Number of interfaces in this area is 4
  It is a NSSA area
  Perform type-7/type-5 LSA translation, suppress forwarding address
.
.
.
Routing Process "ospf 1" with ID 192.168.0.1
  Supports only single TOS(TOS0) routes
  Supports opaque LSA
  Supports Link-local Signaling (LLS)
  Initial SPF schedule delay 5000 msec
  Minimum hold time between two consecutive SPF's 10000 msec
  Maximum wait time between two consecutive SPF's 10000 msec
  Incremental-SPF disabled
  Minimum LSA interval 5 secs
  Minimum LSA arrival 1000 msec
  LSA group pacing timer 240 secs
  Interface flood pacing timer 33 msec
  Retransmission pacing timer 66 msec
  Number of external LSA 0. Checksum Sum 0x0
  Number of opaque AS LSA 0. Checksum Sum 0x0
  Number of DCbitless external and opaque AS LSA 0
  Number of DoNotAge external and opaque AS LSA 0
  Number of areas in this router is 0. 0 normal 0 stub 0 nssa
  External flood list length 0

```

The table below describes the significant fields shown in the display.

Table 175: show ip ospf Field Descriptions

| Field | Description |
|--|--|
| Area | OSPF area and tag. |
| Number of interfaces... | Number of interfaces configured in the area. |
| It is... | Possible types are internal, area border, or autonomous system boundary. |
| Routing process “ospf 1” with ID 192.168.0.1 | Process ID and OSPF router ID. |
| Supports... | Number of types of service supported (Type 0 only). |
| Initial SPF schedule delay | Delay time of SPF calculations at startup. |
| Minimum hold time | Minimum hold time (in milliseconds) between consecutive SPF calculations. |
| Maximum wait time | Maximum wait time (in milliseconds) between consecutive SPF calculations. |
| Incremental-SPF | Status of incremental SPF calculations. |
| Minimum LSA... | Minimum time interval (in seconds) between link-state advertisements, and minimum arrival time (in milliseconds) of link-state advertisements, |
| LSA group pacing timer | Configured LSA group pacing timer (in seconds). |
| Interface flood pacing timer | Configured LSA flood pacing timer (in milliseconds). |
| Retransmission pacing timer | Configured LSA retransmission pacing timer (in milliseconds). |
| Number of... | Number and type of link-state advertisements that have been received. |
| Number of external LSA | Number of external link-state advertisements. |
| Number of opaque AS LSA | Number of opaque link-state advertisements. |
| Number of DCbitless external and opaque AS LSA | Number of demand circuit external and opaque link-state advertisements. |
| Number of DoNotAge external and opaque AS LSA | Number of do not age external and opaque link-state advertisements. |
| Number of areas in this router is | Number of areas configured for the router listed by type. |
| External flood list length | External flood list length. |

The following is sample output from the **show ip ospf** command. In this example, the user had configured the **redistribution maximum-prefix** command to set a limit of 2000 redistributed routes. SPF throttling was configured with the **timersthrottlespf** command.

```
Device#show ip ospf 1
Routing Process "ospf 1" with ID 10.0.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
It is an autonomous system boundary router
Redistributing External Routes from,
    static, includes subnets in redistribution
    Maximum limit of redistributed prefixes 2000
    Threshold for warning message 75%
Initial SPF schedule delay 5000 msec
Minimum hold time between two consecutive SPF's 10000 msec
Maximum wait time between two consecutive SPF's 10000 msec
```

The table below describes the significant fields shown in the display.

Table 176: show ip ospf Field Descriptions

| Field | Description |
|---|--|
| Routing process "ospf 1" with ID 10.0.0.1 | Process ID and OSPF router ID. |
| Supports ... | Number of Types of Service supported. |
| It is ... | Possible types are internal, area border, or autonomous system boundary router. |
| Redistributing External Routes from | Lists of redistributed routes, by protocol. |
| Maximum limit of redistributed prefixes | Value set in the redistribution maximum-prefix command to set a limit on the number of redistributed routes. |
| Threshold for warning message | Percentage set in the redistribution maximum-prefix command for the threshold number of redistributed routes needed to cause a warning message. The default is 75 percent of the maximum limit. |
| Initial SPF schedule delay | Delay (in milliseconds) before initial SPF schedule for SPF throttling. Configured with the timersthrottlespf command. |
| Minimum hold time between two consecutive SPF's | Minimum hold time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the timersthrottlespf command. |
| Maximum wait time between two consecutive SPF's | Maximum wait time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the timersthrottlespf command. |
| Number of areas | Number of areas in router, area addresses, and so on. |

The following is sample output from the **show ip ospf** command. In this example, the user had configured LSA throttling, and those lines of output are displayed in bold.

```

Device#show ip ospf 1
Routing Process "ospf 4" with ID 10.10.24.4
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Initial SPF schedule delay 5000 msec
Minimum hold time between two consecutive SPF's 10000 msec
Maximum wait time between two consecutive SPF's 10000 msec
Incremental-SPF disabled
Initial LSA throttle delay 100 msec
Minimum hold time for LSA throttle 10000 msec

Maximum wait time for LSA throttle 45000 msec
Minimum LSA arrival 1000 msec
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msec
Retransmission pacing timer 66 msec
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
  Area 24
    Number of interfaces in this area is 2
    Area has no authentication
    SPF algorithm last executed 04:28:18.396 ago
    SPF algorithm executed 8 times
    Area ranges are
    Number of LSA 4. Checksum Sum 0x23EB9
    Number of opaque link LSA 0. Checksum Sum 0x0
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0

```

The following is sample **show ip ospf** command. In this example, the user had configured the **redistribution maximum-prefix** command to set a limit of 2000 redistributed routes. SPF throttling was configured with the **timer throttle spf** command.

```

Device#show ip ospf 1
Routing Process "ospf 1" with ID 192.168.0.0
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
It is an autonomous system boundary router
Redistributing External Routes from,
  static, includes subnets in redistribution
  Maximum limit of redistributed prefixes 2000
  Threshold for warning message 75%
Initial SPF schedule delay 5000 msec
Minimum hold time between two consecutive SPF's 10000 msec
Maximum wait time between two consecutive SPF's 10000 msec

```

The table below describes the significant fields shown in the display.

Table 177: show ip ospf Field Descriptions

| Field | Description |
|---|---|
| Routing process "ospf 1" with ID 192.168.0.0. | Process ID and OSPF router ID. |
| Supports ... | Number of TOS supported. |
| It is ... | Possible types are internal, area border, or autonomous system boundary routers. |
| Redistributing External Routes from | Lists of redistributed routes, by protocol. |
| Maximum limit of redistributed prefixes | Value set in the redistributionmaximum-prefix command to set a limit on the number of redistributed routes. |
| Threshold for warning message | Percentage set in the redistributionmaximum-prefix command for the threshold number of redistributed routes needed to cause a warning message. The default is 75 percent of the maximum limit. |
| Initial SPF schedule delay | Delay (in milliseconds) before the initial SPF schedule for SPF throttling. Configured with the timersthrottlespf command. |
| Minimum hold time between two consecutive SPF's | Minimum hold time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the timersthrottlespf command. |
| Maximum wait time between two consecutive SPF's | Maximum wait time (in milliseconds) between two consecutive SPF calculations for SPF throttling. Configured with the timersthrottlespf command. |
| Number of areas | Number of areas in router, area addresses, and so on. |

The following is sample output from the **show ip ospf** command. In this example, the user had configured LSA throttling, and those lines of output are displayed in bold.

```

Device#show ip ospf 1
Routing Process "ospf 4" with ID 10.10.24.4
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Link-local Signaling (LLS)
 Initial SPF schedule delay 5000 msec
 Minimum hold time between two consecutive SPF's 10000 msec
 Maximum wait time between two consecutive SPF's 10000 msec
 Incremental-SPF disabled
 Initial LSA throttle delay 100 msec
 Minimum hold time for LSA throttle 10000 msec
 Maximum wait time for LSA throttle 45000 msec
 Minimum LSA arrival 1000 msec
 LSA group pacing timer 240 secs
 Interface flood pacing timer 33 msec
 Retransmission pacing timer 66 msec
 Number of external LSA 0. Checksum Sum 0x0
 Number of opaque AS LSA 0. Checksum Sum 0x0
 Number of DCbitless external and opaque AS LSA 0
 Number of DoNotAge external and opaque AS LSA 0

```

```
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
  Area 24
    Number of interfaces in this area is 2
    Area has no authentication
    SPF algorithm last executed 04:28:18.396 ago
    SPF algorithm executed 8 times
    Area ranges are
    Number of LSA 4. Checksum Sum 0x23EB9
    Number of opaque link LSA 0. Checksum Sum 0x0
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0
```

show ip ospf border-routers

To display the internal Open Shortest Path First (OSPF) routing table entries to an Area Border Router (ABR) and Autonomous System Boundary Router (ASBR), use the **show ip ospf border-routers** command in privileged EXEC mode.

show ip ospf border-routers

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output from the **show ip ospf border-routers** command:

```
Device#show ip ospf border-routers
OSPF Process 109 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 192.168.97.53 [10] via 172.16.1.53, Serial0, ABR, Area 0.0.0.3, SPF 3
i 192.168.103.51 [10] via 192.168.96.51, Serial0, ABR, Area 0.0.0.3, SPF 3
I 192.168.103.52 [22] via 192.168.96.51, Serial0, ASBR, Area 0.0.0.3, SPF 3
I 192.168.103.52 [22] via 172.16.1.53, Serial0, ASBR, Area 0.0.0.3, SPF 3
```

The table below describes the significant fields shown in the display.

Table 178: show ip ospf border-routers Field Descriptions

| Field | Description |
|-----------------|--|
| 192.168.97.53 | Router ID of the destination. |
| [10] | Cost of using this route. |
| via 172.16.1.53 | Next hop toward the destination. |
| Serial0 | Interface type for the outgoing interface. |
| ABR | The router type of the destination; it is either an ABR or ASBR or both. |
| Area | The area ID of the area from which this route is learned. |
| SPF 3 | The internal number of the shortest path first (SPF) calculation that installs this route. |

show ip ospf database

To display lists of information related to the Open Shortest Path First (OSPF) database for a specific router, use the **show ip ospf database** command in EXEC mode.

```

show ip ospf [process-id area-id] database
show ip ospf [process-id area-id] database [adv-router [ip-address]]
show ip ospf [process-id area-id] database [asbr-summary] [link-state-id]
show ip ospf [process-id area-id] database [asbr-summary] [link-state-id] [adv-router [ip-address]]
show ip ospf [process-id area-id] database [asbr-summary] [link-state-id] [self-originate]
[link-state-id]
show ip ospf [process-id area-id] database [database-summary]
show ip ospf [process-id] database [external] [link-state-id]

show ip ospf [ process-id area-id ] database lsa-summary
show ip ospf [ process-id area-id ] database lsa-summary detail
show ip ospf [ process-id area-id ] database lsa-summary router-id router-id

```

Syntax Description

| | |
|--------------------------------|--|
| <i>process-id</i> | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when enabling the OSPF routing process. |
| <i>area-id</i> | (Optional) Area number associated with the OSPF address range defined in the network router configuration command used to define the particular area. |
| adv-router [ip-address] | (Optional) Displays all the LSAs of the specified router. If no IP address is included, the information is about the local router itself (in this case, the same as self-originate). |

| | |
|--|--|
| <i>link-state-id</i> | <p>(Optional) Portion of the Internet environment that is being described by the advertisement. The value entered depends on the advertisement's LS type. It must be entered in the form of an IP address.</p> <p>When the link state advertisement is describing a network, the <i>link-state-id</i> can take one of two forms:</p> <p>The network's IP address (as in type 3 summary link advertisements and in autonomous system external link advertisements).</p> <p>A derived address obtained from the link state ID. (Note that masking a network links advertisement's link state ID with the network's subnet mask yields the network's IP address.)</p> <p>When the link state advertisement is describing a router, the link state ID is always the described router's OSPF router ID.</p> <p>When an autonomous system external advertisement (LS Type = 5) is describing a default route, its link state ID is set to Default Destination (0.0.0.0).</p> |
| asbr-summary | (Optional) Displays information only about the autonomous system boundary router summary LSAs. |
| database-summary | (Optional) Displays how many of each type of LSA for each area there are in the database, and the total. |
| external | (Optional) Displays information only about the external LSAs. |
| network | (Optional) Displays information only about the network LSAs. |
| nssa-external | (Optional) Displays information only about the NSSA external LSAs. |
| router | (Optional) Displays information only about the router LSAs. |
| self-originate | (Optional) Displays only self-originated LSAs (from the local router). |
| summary | (Optional) Displays information only about the summary LSAs. |
| lsa-summary | Displays the total LSA count per advertising router. |
| lsa-summary detail | Displays the count of each type of LSAs per advertising router. |
| lsa-summary router-id <i>router-id</i> | Displays the count of each type of LSAs for the specified advertising router. |

Command Modes EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The various forms of this command deliver information about different OSPF link state advertisements.

Examples

The following is sample output from the **show ip ospf database** command when no arguments or keywords are used:

```
Device#show ip ospf database
OSPF Router with id(192.168.239.66) (Process ID 300)
    Displaying Router Link States(Area 0.0.0.0)
  Link ID      ADV Router    Age          Seq#          Checksum      Link count
172.16.21.6   172.16.21.6   1731        0x80002CFB   0x69BC        8
172.16.21.5   172.16.21.5   1112        0x800009D2   0xA2B8        5
172.16.1.2    172.16.1.2    1662        0x80000A98   0x4CB6        9
172.16.1.1    172.16.1.1    1115        0x800009B6   0x5F2C        1
172.16.1.5    172.16.1.5    1691        0x80002BC    0x2A1A        5
172.16.65.6   172.16.65.6   1395        0x80001947   0xEEE1        4
172.16.241.5  172.16.241.5  1161        0x8000007C   0x7C70        1
172.16.27.6   172.16.27.6   1723        0x80000548   0x8641        4
172.16.70.6   172.16.70.6   1485        0x80000B97   0xEB84        6
    Displaying Net Link States(Area 0.0.0.0)
  Link ID      ADV Router    Age          Seq#          Checksum
172.16.1.3    192.168.239.66 1245        0x800000EC   0x82E
    Displaying Summary Net Link States(Area 0.0.0.0)
  Link ID      ADV Router    Age          Seq#          Checksum
172.16.240.0  172.16.241.5  1152        0x80000077   0x7A05
172.16.241.0  172.16.241.5  1152        0x80000070   0xAEB7
172.16.244.0  172.16.241.5  1152        0x80000071   0x95CB
```

The table below describes the significant fields shown in the display.

Table 179: show ip ospf Database Field Descriptions

| Field | Description |
|------------|--|
| Link ID | Router ID number. |
| ADV Router | Advertising router's ID. |
| Age | Link state age. |
| Seq# | Link state sequence number (detects old or duplicate link state advertisements). |
| Checksum | Fletcher checksum of the complete contents of the link state advertisement. |
| Link count | Number of interfaces detected for router. |

The following is sample output from the **show ip ospf database asbr-summary** command with the **asbr-summary** keyword:

```
Device#show ip ospf database asbr-summary
OSPF Router with id(192.168.239.66) (Process ID 300)
    Displaying Summary ASB Link States(Area 0.0.0.0)
LS age: 1463
Options: (No TOS-capability)
LS Type: Summary Links(AS Boundary Router)
Link State ID: 172.16.245.1 (AS Boundary Router address)
Advertising Router: 172.16.241.5
LS Seq Number: 80000072
Checksum: 0x3548
Length: 28
Network Mask: 0.0.0.0 TOS: 0 Metric: 1
```

The table below describes the significant fields shown in the display.

Table 180: show ip ospf database asbr-summary Field Descriptions

| Field | Description |
|---------------------|---|
| OSPF Router with id | Router ID number. |
| Process ID | OSPF process ID. |
| LS age | Link state age. |
| Options | Type of service options (Type 0 only). |
| LS Type | Link state type. |
| Link State ID | Link state ID (autonomous system boundary router). |
| Advertising Router | Advertising router's ID. |
| LS Seq Number | Link state sequence (detects old or duplicate link state advertisements). |
| Checksum | LS checksum (Fletcher checksum of the complete contents of the link state advertisement). |
| Length | Length in bytes of the link state advertisement. |
| Network Mask | Network mask implemented. |
| TOS | Type of service. |
| Metric | Link state metric. |

The following is sample output from the **show ip ospf database** command with the **external** keyword:

```
Device#show ip ospf database external
OSPF Router with id(192.168.239.66) (Autonomous system 300)
      Displaying AS External Link States
LS age: 280
Options: (No TOS-capability)
LS Type: AS External Link
Link State ID: 10.105.0.0 (External Network Number)
Advertising Router: 172.16.70.6
LS Seq Number: 80000AFD
Checksum: 0xC3A
Length: 36
Network Mask: 255.255.0.0
      Metric Type: 2 (Larger than any link state path)
      TOS: 0
      Metric: 1
      Forward Address: 0.0.0.0
      External Route Tag: 0
```

The table below describes the significant fields shown in the display.

Table 181: show ip ospf database external Field Descriptions

| Field | Description |
|---------------------|---|
| OSPF Router with id | Router ID number. |
| Autonomous system | OSPF autonomous system number (OSPF process ID). |
| LS age | Link state age. |
| Options | Type of service options (Type 0 only). |
| LS Type | Link state type. |
| Link State ID | Link state ID (external network number). |
| Advertising Router | Advertising router's ID. |
| LS Seq Number | Link state sequence number (detects old or duplicate link state advertisements). |
| Checksum | LS checksum (Fletcher checksum of the complete contents of the LSA). |
| Length | Length in bytes of the link state advertisement. |
| Network Mask | Network mask implemented. |
| Metric Type | External Type. |
| TOS | Type of service. |
| Metric | Link state metric. |
| Forward Address | Forwarding address. Data traffic for the advertised destination will be forwarded to this address. If the forwarding address is set to 0.0.0.0, data traffic will be forwarded instead to the advertisement's originator. |
| External Route Tag | External route tag, a 32-bit field attached to each external route. This is not used by the OSPF protocol itself. |

The following is sample output from the **show ip ospf database network** command with the **network** keyword:

```
Device#show ip ospf database network
  OSPF Router with id(192.168.239.66) (Process ID 300)
    Displaying Net Link States(Area 0.0.0.0)
LS age: 1367
Options: (No TOS-capability)
LS Type: Network Links
Link State ID: 172.16.1.3 (address of Designated Router)
Advertising Router: 192.168.239.66
LS Seq Number: 800000E7
Checksum: 0x1229
Length: 52
Network Mask: 255.255.255.0
  Attached Router: 192.168.239.66
  Attached Router: 172.16.241.5
  Attached Router: 172.16.1.1
  Attached Router: 172.16.54.5
  Attached Router: 172.16.1.5
```

The table below describes the significant fields shown in the display.

Table 182: show ip ospf database network Field Descriptions

| Field | Description |
|---------------------|---|
| OSPF Router with id | Router ID number. |
| Process ID 300 | OSPF process ID. |
| LS age | Link state age. |
| Options | Type of service options (Type 0 only). |
| LS Type: | Link state type. |
| Link State ID | Link state ID of designated router. |
| Advertising Router | Advertising router's ID. |
| LS Seq Number | Link state sequence (detects old or duplicate link state advertisements). |
| Checksum | LS checksum (Fletcher checksum of the complete contents of the link state advertisement). |
| Length | Length in bytes of the link state advertisement. |
| Network Mask | Network mask implemented. |
| AS Boundary Router | Definition of router type. |
| Attached Router | List of routers attached to the network, by IP address. |

The following is sample output from the **show ip ospf database** command with the **router** keyword:

```
Device#show ip ospf database router
OSPF Router with id(192.168.239.66) (Process ID 300)
Displaying Router Link States(Area 0.0.0.0)
LS age: 1176
Options: (No TOS-capability)
LS Type: Router Links
Link State ID: 172.16.21.6
Advertising Router: 172.16.21.6

Number of TOS metrics: 0
TOS 0 Metrics: 2
```

The table below describes the significant fields shown in the display.

Table 183: show ip ospf database router Field Descriptions

| Field | Description |
|---------------------|---|
| OSPF Router with id | Router ID number. |
| Process ID | OSPF process ID. |
| LS age | Link state age. |
| Options | Type of service options (Type 0 only). |
| LS Type | Link state type. |
| Link State ID | Link state ID. |
| Advertising Router | Advertising router's ID. |
| LS Seq Number | Link state sequence (detects old or duplicate link state advertisements). |
| Checksum | LS checksum (Fletcher checksum of the complete contents of the link state advertisement). |
| Length | Length in bytes of the link state advertisement. |
| AS Boundary Router | Definition of router type. |
| Number of Links | Number of active links. |
| link ID | Link type. |
| Link Data | Router interface address. |
| TOS | Type of service metric (Type 0 only). |

The following is sample output from **show ip ospf database summary** command with the **summary** keyword:

```
Device#show ip ospf database summary
      OSPF Router with id(192.168.239.66) (Process ID 300)
      Displaying Summary Net Link States(Area 0.0.0.0)
LS age: 1401
Options: (No TOS-capability)
LS Type: Summary Links(Network)
Link State ID: 172.16.240.0 (summary Network Number)
Advertising Router: 172.16.241.5
LS Seq Number: 80000072
Checksum: 0x84FF
Length: 28
Network Mask: 255.255.255.0  TOS: 0  Metric: 1
```

The table below describes the significant fields shown in the display.

Table 184: show ip ospf database summary Field Descriptions

| Field | Description |
|---------------------|-------------------|
| OSPF Router with id | Router ID number. |

| Field | Description |
|--------------------|---|
| Process ID | OSPF process ID. |
| LS age | Link state age. |
| Options | Type of service options (Type 0 only). |
| LS Type | Link state type. |
| Link State ID | Link state ID (summary network number). |
| Advertising Router | Advertising router's ID. |
| LS Seq Number | Link state sequence (detects old or duplicate link state advertisements). |
| Checksum | LS checksum (Fletcher checksum of the complete contents of the link state advertisement). |
| Length | Length in bytes of the link state advertisement. |
| Network Mask | Network mask implemented. |
| TOS | Type of service. |
| Metric | Link state metric. |

The following is sample output from **show ip ospf database database-summary** command with the **database-summary** keyword:

```

Device#show ip ospf database database-summary
OSPF Router with ID (10.0.0.1) (Process ID 1)
Area 0 database summary

```

The table below describes the significant fields shown in the display.

Table 185: show ip ospf database database-summary Field Descriptions

| Field | Description |
|----------------------------|---|
| Area 0 database summary | Area number. |
| Count | Count of LSAs of the type identified in the first column. |
| Router | Number of router link state advertisements in that area. |
| Network | Number of network link state advertisements in that area. |
| Summary Net | Number of summary link state advertisements in that area. |
| Summary ASBR | Number of summary autonomous system boundary router (ASBR) link state advertisements in that area. |
| Type-7 Ext | Type-7 LSA count. |
| Self-originated Type-7 | Self-originated Type-7 LSA. |
| Opaque Link | Type-9 LSA count. |
| Opaque Area | Type-10 LSA count |
| Subtotal | Sum of LSAs for that area. |
| Delete | Number of link state advertisements that are marked "Deleted" in that area. |
| Maxage | Number of link state advertisements that are marked "Maxaged" in that area. |
| Process 1 database summary | Database summary for the process. |
| Count | Count of LSAs of the type identified in the first column. |
| Router | Number of router link state advertisements in that process. |
| Network | Number of network link state advertisements in that process. |
| Summary Net | Number of summary link state advertisements in that process. |
| Summary ASBR | Number of summary autonomous system boundary router (ASBR) link state advertisements in that process. |
| Type-7 Ext | Type-7 LSA count. |
| Opaque Link | Type-9 LSA count. |
| Opaque Area | Type-10 LSA count. |
| Type-5 Ext | Type-5 LSA count. |
| Self-Originated Type-5 | Self-originated Type-5 LSA count. |
| Opaque AS | Type-11 LSA count. |
| Total | Sum of LSAs for that process. |

| Field | Description |
|--------|--|
| Delete | Number of link state advertisements that are marked "Deleted" in that process. |
| Maxage | Number of link state advertisements that are marked "Maxaged" in that process. |

show ip ospf fast-reroute

To display information for an OSPF per-prefix LFA FRR configuration, use the **show ip ospf fast-reroute** command in privileged EXEC mode.

show ip ospf [*{process-id}*] **fast-reroute** [{**prefix-summary** | **remote-lfa tunnels** | **ti-lfa** [**tunnels**]}]

| Syntax Description | | |
|--------------------|----------------------------------|--|
| | <i>process-id</i> | (Optional) Internal identification. It is locally assigned and can be a positive integer. The number used here is the number assigned administratively when enabling the OSPF routing process. |
| | prefix-summary | (Optional) Displays information about the prefixes protected by the LFA FRR repair paths. |
| | remote-lfa tunnels | (Optional) Displays information about the tunnel interfaces created by the remote LFA FRR. |
| | ti-lfa [tunnels] | (Optional) Displays information about the topology-independent LFA. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines Use the **show ip ospf fast-reroute** command to display information about the current tiebreaker policy. Use the **prefix-summary** keyword to display the number of prefixes per area, per priority, and how many have repair paths, in absolute numbers and in percentages.

Use the **remote-lfa tunnels** keyword to display information about the tunnel interfaces created by the remote LFA FRR using the **fast-reroute per-prefix remote-lfa tunnel** command.

Examples

The following example displays summary information about the LFA FRR status, including the current tiebreaker policy:

```
Device# show ip ospf fast-reroute

      OSPF Router with ID (192.1.1.1) (Process ID 1)
Loop-free Fast Reroute protected prefixes:
      Area          Topology name  Priority
      1              Base           Low
172.69.69.66        Base           High
AS external         Base           Low
Repair path selection policy tiebreaks:
 23  srlg
 34  lowest-metric
 67  primary-path (required)
256  load-sharing
Last SPF calculation started 00:00:11 ago and was running for 20 ms.
```

The following table describes the significant fields shown in the display:

Table 186: show ip ospf fast-reroute Field Descriptions

| Field | Description |
|--|---|
| Priority | Priority assigned to the protected prefix. |
| Repair path selection policy tiebreaks | Tiebreaking policy attributes and their priority-index assignments. |

The following example displays information about the prefixes that are protected by the OSPFv2 Loop-Free Alternate FRR feature. It displays information about the number of prefixes, by area and by priority (high or low), and how many are protected, that is, have repair paths configured.

```
Device# show ip ospf fast-reroute prefix-summary

          OSPF Router with ID (192.1.1.1) (Process ID 1)
                Base Topology (MTID 0)

Area 0:
Interface          Protected   Primary paths   Protected paths   Percent protected
                   Yes           All High Low     All High Low     All High Low
Loopback0          Yes           0   0   0         0   0   0         0%   0%   0%
Ethernet0/3        Yes           1   1   0         0   0   0         0%   0%   0%
Ethernet0/2        Yes           3   2   1         2   1   1         66%  50% 100%
Ethernet0/1        Yes           2   1   1         2   1   1         100% 100% 100%
Ethernet0/0        Yes           4   2   2         4   2   2         100% 100% 100%
Area total:                10   6   4         8   4   4         80%  66% 100%
Process total:              10   6   4         8   4   4         80%  66% 100%
```

The following example displays information about the tunnel interfaces created by the remote LFA FRR:

```
Device# show ip ospf fast-reroute remote-lfa tunnels

OSPF Router with ID (192.168.1.1) (Process ID 1)
Area with ID (0)
Base Topology (MTID 0)

Interface MPLS-Remote-Lfa3
  Tunnel type: MPLS-LDP
  Tailend router ID: 192.168.3.3
  Termination IP address: 192.168.3.3
  Outgoing interface: Ethernet0/0
  First hop gateway: 192.168.14.4
  Tunnel metric: 20
  Protects:
    192.168.12.2 Ethernet0/1, total metric 30
```

Related Commands

| Command | Description |
|--|---|
| debug ip ospf fast-reroute | Displays debugging information for per-prefix LFA FRR paths. |
| fast-reroute keep-all-paths | Keeps a list of all the candidate repair paths that were considered when a per-prefix LFA FRR path was computed. |
| fast-reroute per-prefix | Configures a per-prefix LFA FRR path that redirects traffic to an alternative next hop other than the primary neighbor. |
| fast-reroute per-prefix remote-lfa maximum-cost | Configures the maximum distance to the tunnel endpoint. |

| Command | Description |
|--|---|
| fast-reroute per-prefix remote-lfa tunnel | Configures a per-prefix LFA FRR path that redirects traffic to a remote LFA. |
| fast-reroute tie-break | Configures the LFA FRR tiebreaking priority. |
| ip ospf fast-reroute per-prefix | Configures an interface as either protecting or protected. |
| prefix-priority | Configures a set of prefixes to have high priority for protection in an OSPF local RIB. |
| show ip ospf neighbor | Displays OSPF neighbor information on a per-interface basis. |
| show ip ospf rib | Displays information for the OSPF local RIB or locally redistributed routes. |

show ip ospf interface

To display interface information related to Open Shortest Path First (OSPF), use the **show ip ospf interface** command in user EXEC or privileged EXEC mode.

show ip [ospf] [process-id] interface [type number] [brief] [multicast] [topology {topology-name | base}]

Syntax Description

| | |
|-------------------------------|--|
| <i>process-id</i> | (Optional) Process ID number. If this argument is included, only information for the specified routing process is included. The range is 1 to 65535. |
| <i>type</i> | (Optional) Interface type. If the <i>type</i> argument is included, only information for the specified interface type is included. |
| <i>number</i> | (Optional) Interface number. If the <i>number</i> argument is included, only information for the specified interface number is included. |
| brief | (Optional) Displays brief overview information for OSPF interfaces, states, addresses and masks, and areas on the device. |
| multicast | (Optional) Displays multicast information. |
| topology topology-name | (Optional) Displays OSPF-related information about the named topology instance. |
| topology base | (Optional) Displays OSPF-related information about the base topology. |

| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output from the **show ip ospf interface** command when Ethernet interface 0/0 is specified:

```
Device#show ip ospf interface ethernet 0/0

Ethernet0/0 is up, line protocol is up
  Internet Address 192.168.254.202/24, Area 0
  Process ID 1, Router ID 192.168.99.1, Network Type BROADCAST, Cost: 10
  Topology-MTID    Cost    Disabled    Shutdown    Topology Name
    0              10         no         no         Base
  Transmit Delay is 1 sec, State DR, Priority 1
  Designated Router (ID) 192.168.99.1, Interface address 192.168.254.202
  Backup Designated router (ID) 192.168.254.10, Interface address 192.168.254.10
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    oob-resync timeout 40
    Hello due in 00:00:05
  Supports Link-local Signaling (LLS)
  Cisco NSF helper support enabled
```

```

IETF NSF helper support enabled
Index 1/1, flood queue length 0
Next 0x0(0)/0x0(0)
Last flood scan length is 1, maximum is 1
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
  Adjacent with neighbor 192.168.254.10 (Backup Designated Router)
Suppress hello for 0 neighbor(s)

```

In Cisco IOS Release 12.2(33)SRB, the following sample output from the **show ip ospf interface brief topology VOICE** command shows a summary of information, including a confirmation that the Multitopology Routing (MTR) VOICE topology is configured in the interface configuration:

```

Device#show ip ospf interface brief topology VOICE

VOICE Topology (MTID 10)
Interface  PID  Area  IP Address/Mask  Cost  State Nbrs F/C
Lo0        1   0     10.0.0.2/32      1     LOOP  0/0
Se2/0     1   0     10.1.0.2/30     10    P2P   1/1

```

The following sample output from the **show ip ospf interface brief topology VOICE** command displays details of the MTR VOICE topology for the interface. When the command is entered without the **brief** keyword, more information is displayed.

```

Device#show ip ospf interface topology VOICE

                               VOICE Topology (MTID 10)
Loopback0 is up, line protocol is up

  Process ID 1, Router ID 10.0.0.2, Network Type LOOPBACK
  Topology-MTID   Cost   Disabled   Shutdown   Topology Name
    10            1     no        no         VOICE
Loopback interface is treated as a stub Host Serial2/0 is up, line protocol is up
  Internet Address 10.1.0.2/30, Area 0
  Process ID 1, Router ID 10.0.0.2, Network Type POINT_TO_POINT
  Topology-MTID   Cost   Disabled   Shutdown   Topology Name
    10            10    no        no         VOICE
  Transmit Delay is 1 sec, State POINT_TO_POINT
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    oob-resync timeout 40
    Hello due in 00:00:03
  Supports Link-local Signaling (LLS)
  Cisco NSF helper support enabled
  IETF NSF helper support enabled
  Index 1/1, flood queue length 0
  Next 0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 10.0.0.1
  Suppress hello for 0 neighbor(s)

```

In Cisco IOS Release 12.2(33)SRC, the following sample output from the **show ip ospf interface** command displays details about the configured Time-to-Live (TTL) limits:

```

Device#show ip ospf interface ethernet 0
.
.
.
Strict TTL checking enabled
! or a message similar to the following is displayed
Strict TTL checking enabled, up to 4 hops allowed

```

.
.
.

The table below describes the significant fields shown in the displays.

Table 187: show ip ospf interface Field Descriptions

| Field | Description |
|---|--|
| Ethernet | Status of the physical link and operational status of the protocol. |
| Process ID | OSPF process ID. |
| Area | OSPF area. |
| Cost | Administrative cost assigned to the interface. |
| State | Operational state of the interface. |
| Nbrs F/C | OSPF neighbor count. |
| Internet Address | Interface IP address, subnet mask, and area address. |
| Topology-MTID | MTR topology Multitopology Identifier (MTID). A number assigned so that the protocol can identify the topology associated with information that it sends to its peers. |
| Transmit Delay | Transmit delay in seconds, interface state, and device priority. |
| Designated Router | Designated router ID and respective interface IP address. |
| Backup Designated router | Backup designated router ID and respective interface IP address. |
| Timer intervals configured | Configuration of timer intervals. |
| Hello | Number of seconds until the next hello packet is sent out this interface. |
| Strict TTL checking enabled | Only one hop is allowed. |
| Strict TTL checking enabled, up to 4 hops allowed | A set number of hops has been explicitly configured. |
| Neighbor Count | Count of network neighbors and list of adjacent neighbors. |

show ip ospf neighbor

To display Open Shortest Path First (OSPF) neighbor information on a per-interface basis, use the **show ip ospf neighbor** command in privileged EXEC mode.

show ip ospf neighbor [*interface-type interface-number*] [*neighbor-id*] [**detail**] [**summary**] [**per-instance**]

| Syntax Description | |
|--|---|
| <i>interface-type interface-number</i> | (Optional) Type and number associated with a specific OSPF interface. |
| <i>neighbor-id</i> | (Optional) Neighbor hostname or IP address in A.B.C.D format. |
| detail | (Optional) Displays all neighbors given in detail (lists all neighbors). |
| summary | (Optional) Displays total number summary of all neighbors. |
| per-instance | (Optional) Displays total number of neighbors in each neighbor state. The output is printed for each configured OSPF instance separately. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following sample output from the **show ip ospf neighbor** command shows a single line of summary information for each neighbor:

```
Device#show ip ospf neighbor

Neighbor ID    Pri   State           Dead Time   Address        Interface
10.199.199.137 1     FULL/DR         0:00:31    192.168.80.37 Ethernet0
172.16.48.1    1     FULL/DROTHER    0:00:33    172.16.48.1   Fddi0
172.16.48.200 1     FULL/DROTHER    0:00:33    172.16.48.200 Fddi0
10.199.199.137 5     FULL/DR         0:00:33    172.16.48.189 Fddi0
```

The following is sample output showing summary information about the neighbor that matches the neighbor ID:

```
Device#show ip ospf neighbor 10.199.199.137

Neighbor 10.199.199.137, interface address 192.168.80.37
  In the area 0.0.0.0 via interface Ethernet0
  Neighbor priority is 1, State is FULL
  Options 2
  Dead timer due in 0:00:32
  Link State retransmission due in 0:00:04
Neighbor 10.199.199.137, interface address 172.16.48.189
  In the area 0.0.0.0 via interface Fddi0
  Neighbor priority is 5, State is FULL
  Options 2
  Dead timer due in 0:00:32
```

```
Link State retransmission due in 0:00:03
```

If you specify the interface along with the neighbor ID, the system displays the neighbors that match the neighbor ID on the interface, as in the following sample display:

```
Device#show ip ospf neighbor ethernet 0 10.199.199.137

Neighbor 10.199.199.137, interface address 192.168.80.37
  In the area 0.0.0.0 via interface Ethernet0
  Neighbor priority is 1, State is FULL
  Options 2
  Dead timer due in 0:00:37
  Link State retransmission due in 0:00:04
```

You can also specify the interface without the neighbor ID to show all neighbors on the specified interface, as in the following sample display:

```
Device#show ip ospf neighbor fddi 0

   ID          Pri   State           Dead Time   Address      Interface
172.16.48.1    1    FULL/DROTHER   0:00:33    172.16.48.1  Fddi0
172.16.48.200  1    FULL/DROTHER   0:00:32    172.16.48.200 Fddi0
10.199.199.137 5    FULL/DR        0:00:32    172.16.48.189 Fddi0
```

The following is sample output from the **show ip ospf neighbor detail** command:

```
Device#show ip ospf neighbor detail

Neighbor 192.168.5.2, interface address 10.225.200.28
  In the area 0 via interface GigabitEthernet1/0/0
  Neighbor priority is 1, State is FULL, 6 state changes
  DR is 10.225.200.28 BDR is 10.225.200.30
  Options is 0x42
  LLS Options is 0x1 (LR), last OOB-Resync 00:03:08 ago
  Dead timer due in 00:00:36
  Neighbor is up for 00:09:46
  Index 1/1, retransmission queue length 0, number of retransmission 1
  First 0x0(0)/0x0(0) Next 0x0(0)/0x0(0)
  Last retransmission scan length is 1, maximum is 1
  Last retransmission scan time is 0 msec, maximum is 0 msec
```

The table below describes the significant fields shown in the displays.

Table 188: show ip ospf neighbor detail Field Descriptions

| Field | Description |
|-------------------|---|
| Neighbor | Neighbor router ID. |
| interface address | IP address of the interface. |
| In the area | Area and interface through which the OSPF neighbor is known. |
| Neighbor priority | Router priority of the neighbor and neighbor state. |
| State | OSPF state. If one OSPF neighbor has enabled TTL security, the other side of the connection will show the neighbor in the INIT state. |

| Field | Description |
|---------------------------------|--|
| state changes | Number of state changes since the neighbor was created. This value can be reset using the clearipospfcountersneighbor command. |
| DR is | Router ID of the designated router for the interface. |
| BDR is | Router ID of the backup designated router for the interface. |
| Options | Hello packet options field contents. (E-bit only. Possible values are 0 and 2; 2 indicates area is not a stub; 0 indicates area is a stub.) |
| LLS Options..., last OOB-Resync | Link-Local Signaling and out-of-band (OOB) link-state database resynchronization performed hours:minutes:seconds ago. This is nonstop forwarding (NSF) information. The field indicates the last successful out-of-band resynchronization with the NSF-capable router. |
| Dead timer due in | Expected time in hours:minutes:seconds before Cisco IOS software will declare the neighbor dead. |
| Neighbor is up for | Number of hours:minutes:seconds since the neighbor went into the two-way state. |
| Index | Neighbor location in the area-wide and autonomous system-wide retransmission queue. |
| retransmission queue length | Number of elements in the retransmission queue. |
| number of retransmission | Number of times update packets have been re-sent during flooding. |
| First | Memory location of the flooding details. |
| Next | Memory location of the flooding details. |
| Last retransmission scan length | Number of link state advertisements (LSAs) in the last retransmission packet. |
| maximum | Maximum number of LSAs sent in any retransmission packet. |
| Last retransmission scan time | Time taken to build the last retransmission packet. |
| maximum | Maximum time, in milliseconds, taken to build any retransmission packet. |

The following is sample output from the **show ip ospf neighbor** command showing a single line of summary information for each neighbor. If one OSPF neighbor has enabled TTL security, the other side of the connection will show the neighbor in the INIT state.

```
Device#show ip ospf neighbor
```

```
Neighbor ID    Pri   State           Dead Time   Address           Interface
10.199.199.137 1     FULL/DR         0:00:31    192.168.80.37    Ethernet0
172.16.48.1    1     FULL/DROTHER    0:00:33    172.16.48.1      Fddi0

```

```
10.199.199.137 5 FULL/DR 0:00:33 172.16.48.189 Fddi0
172.16.1.201 1 INIT/DROTHER 00.00.35 10.1.1.201 Ethernet0/0
```

Cisco IOS Release 15.1(3)S

The following sample output from the **show ip ospf neighbor** command shows the network from the neighbor's point of view:

```
Device#show ip ospf neighbor 192.0.2.1
      OSPF Router with ID (192.1.1.1) (Process ID 1)

          Area with ID (0)

Neighbor with Router ID 192.0.2.1:
  Reachable over:
    Ethernet0/0, IP address 192.0.2.1, cost 10

  SPF was executed 1 times, distance to computing router 10

  Router distance table:
    192.1.1.1  i  [10]
    192.0.2.1  i  [0]
    192.3.3.3  i  [10]
    192.4.4.4  i  [20]
    192.5.5.5  i  [20]

  Network LSA distance table:
    192.2.12.2  i  [10]
    192.2.13.3  i  [20]
    192.2.14.4  i  [20]
    192.2.15.5  i  [20]
```

The following is sample output from the **show ip ospf neighbor summary** command:

```
Device#show ip ospf neighbor summary

  Neighbor summary for all OSPF processes

DOWN          0
ATTEMPT       0
INIT          0
2WAY          0
EXSTART       0
EXCHANGE      0
LOADING       0
FULL          1
Total count 1 (Undergoing NSF 0)
```

The following is sample output from the **show ip ospf neighbor summary per-instance** command:

```
Device#show ip ospf neighbor summary

      OSPF Router with ID (1.0.0.10) (Process ID 1)

DOWN          0
ATTEMPT       0
INIT          0
2WAY          0
```

```

EXSTART      0
EXCHANGE     0
LOADING      0
FULL         1
Total count  1      (Undergoing NSF 0)

```

Neighbor summary for all OSPF processes

```

DOWN         0
ATTEMPT     0
INIT        0
2WAY        0
EXSTART     0

LOADING     0
FULL        1
Total count  1      (Undergoing NSF 0)

```

Table 189: show ip ospf neighbor summary and show ip ospf neighbor summary per-instance Field Descriptions

| Field | Description |
|----------|--|
| DOWN | No information (hellos) has been received from this neighbor, but hello packets can still be sent to the neighbor in this state. |
| ATTEMPT | This state is only valid for manually configured neighbors in a Non-Broadcast Multi-Access (NBMA) environment. In Attempt state, the router sends unicast hello packets every poll interval to the neighbor, from which hellos have not been received within the dead interval. |
| INIT | This state specifies that the router has received a hello packet from its neighbor, but the receiving router's ID was not included in the hello packet. When a router receives a hello packet from a neighbor, it should list the sender's router ID in its hello packet as an acknowledgment that it received a valid hello packet. |
| 2WAY | This state designates that bi-directional communication has been established between two routers. |
| EXSTART | This state is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is active, and to decide upon the initial DD sequence number. Neighbor conversations in this state or greater are called adjacencies. |
| EXCHANGE | In this state, OSPF routers exchange database descriptor (DBD) packets. Database descriptors contain link-state advertisement (LSA) headers only and describe the contents of the entire link-state database. Each DBD packet has a sequence number which can be incremented only by the active router which is explicitly acknowledged by the secondary router. Routers also send link-state request packets and link-state update packets (which contain the entire LSA) in this state. The contents of the DBD received are compared to the information contained in the routers link-state database to check if new or more current link-state information is available with the neighbor. |

| Field | Description |
|---------|--|
| LOADING | <p>In this state, the actual exchange of link state information occurs. Based on the information provided by the DBDs, routers send link-state request packets. The neighbor then provides the requested link-state information in link-state update packets. During the adjacency, if a device receives an outdated or missing LSA, it requests that LSA by sending a link-state request packet. All link-state update packets are acknowledged.</p> |
| FULL | <p>In this state, devices are fully adjacent with each other. All the device and network LSAs are exchanged and the devices' databases are fully synchronized.</p> <p>Full is the normal state for an OSPF device. If a device is stuck in another state, it's an indication that there are problems in forming adjacencies. The only exception to this is the 2-way state, which is normal in a broadcast network. Devices achieve the full state with their DR and BDR only. Neighbors always see each other as 2-way.</p> |

show ip ospf virtual-links

To display parameters and the current state of Open Shortest Path First (OSPF) virtual links, use the **show ip ospf virtual-links** command in EXEC mode.

show ip ospf virtual-links

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The information displayed by the **show ip ospf virtual-links** command is useful in debugging OSPF routing operations.

Examples

The following is sample output from the **show ip ospf virtual-links** command:

```
Device#show ip ospf virtual-links
Virtual Link to router 192.168.101.2 is up
Transit area 0.0.0.1, via interface Ethernet0, Cost of using 10
Transmit Delay is 1 sec, State POINT_TO_POINT
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 0:00:08
Adjacency State FULL
```

The table below describes the significant fields shown in the display.

Table 190: show ip ospf virtual-links Field Descriptions

| Field | Description |
|--|--|
| Virtual Link to router 192.168.101.2 is up | Specifies the OSPF neighbor, and if the link to that neighbor is up or down. |
| Transit area 0.0.0.1 | The transit area through which the virtual link is formed. |
| via interface Ethernet0 | The interface through which the virtual link is formed. |
| Cost of using 10 | The cost of reaching the OSPF neighbor through the virtual link. |
| Transmit Delay is 1 sec | The transmit delay (in seconds) on the virtual link. |
| State POINT_TO_POINT | The state of the OSPF neighbor. |
| Timer intervals... | The various timer intervals configured for the link. |
| Hello due in 0:00:08 | When the next hello is expected from the neighbor. |
| Adjacency State FULL | The adjacency state between the neighbors. |

summary-address (OSPF)

To create aggregate addresses for Open Shortest Path First (OSPF), use the **summary-address** command in router configuration mode. To restore the default, use the no form of this command.

summary-address **command** **summary-address** {*ip-address mask* | *prefix mask*} [**not-advertise**] [**tag tag**] [**nssa-only**]

no summary-address {*ip-address mask* | *prefix mask*} [**not-advertise**] [**tag tag**] [**nssa-only**]

Syntax Description

| | |
|----------------------|---|
| <i>ip-address</i> | Summary address designated for a range of addresses. |
| <i>mask</i> | IP subnet mask used for the summary route. |
| <i>prefix</i> | IP route prefix for the destination. |
| not-advertise | (Optional) Suppresses routes that match the specified prefix/mask pair. This keyword applies to OSPF only. |
| tag tag | (Optional) Specifies the tag value that can be used as a “match” value for controlling redistribution via route maps. This keyword applies to OSPF only. |
| nssa-only | (Optional) Sets the nssa-only attribute for the summary route (if any) generated for the specified prefix, which limits the summary to not-so-stubby-area (NSSA) areas. |

Command Default

This command behavior is disabled by default.

Command Modes

Router configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

R routes learned from other routing protocols can be summarized. The metric used to advertise the summary is the lowest metric of all the more specific routes. This command helps reduce the size of the routing table.

Using this command for OSPF causes an OSPF Autonomous System Boundary Router (ASBR) to advertise one external route as an aggregate for all redistributed routes that are covered by the address. For OSPF, this command summarizes only routes from other routing protocols that are being redistributed into OSPF. Use the **area range** command for route summarization between OSPF areas.

OSPF does not support the **summary-address 0.0.0.0 0.0.0.0** command.

Examples

In the following example, the summary address 10.1.0.0 includes address 10.1.1.0, 10.1.2.0, 10.1.3.0, and so on. Only the address 10.1.0.0 is advertised in an external link-state advertisement.

```
Device(config)#summary-address 10.1.0.0 255.255.0.0
```

Related Commands

| Command | Description |
|-----------------------------------|---|
| area range | Consolidates and summarizes routes at an area boundary. |
| ip ospf authentication-key | Assigns a password to be used by neighboring routers that are using the simple password authentication of OSPF. |
| ip ospf message-digest-key | Enables OSPF MD5 authentication. |

timers throttle spf

To turn on Open Shortest Path First (OSPF) shortest path first (SPF) throttling, use the **timers throttle spf** command in the appropriate configuration mode. To turn off OSPF SPF throttling, use the **no** form of this command.

timers throttle spf *spf-start spf-hold spf-max-wait*

no timers throttle spf *spf-start spf-hold spf-max-wait*

Syntax Description

| | |
|---------------------|--|
| <i>spf-start</i> | Initial delay to schedule an SPF calculation after a change, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 5000. |
| <i>spf-hold</i> | Minimum hold time between two consecutive SPF calculations, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 10,000. |
| <i>spf-max-wait</i> | Maximum wait time between two consecutive SPF calculations, in milliseconds. Range is from 1 to 600000. In OSPF for IPv6, the default value is 10,000. |

Command Default

SPF throttling is not set.

Command Modes

Address family configuration (config-router-af) Router address family topology configuration (config-router-af-topology) Router configuration (config-router) OSPF for IPv6 router configuration (config-rtr)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The first wait interval between SPF calculations is the amount of time in milliseconds specified by the *spf-start* argument. Each consecutive wait interval is two times the current hold level in milliseconds until the wait time reaches the maximum time in milliseconds as specified by the *spf-max-wait* argument. Subsequent wait times remain at the maximum until the values are reset or a link-state advertisement (LSA) is received between SPF calculations.

Release 12.2(33)SRB

If you plan to configure the Multi-Topology Routing (MTR) feature, you need to enter the **timers throttle spf** command in router address family topology configuration mode in order to make this OSPF router configuration command become topology-aware.

Release 15.2(1)T

When you configure the **ospfv3 network manet** command on any interface attached to the OSPFv3 process, the default values for the *spf-start*, *spf-hold*, and the *spf-max-wait* arguments are reduced to 1000 milliseconds, 1000 milliseconds, and 2000 milliseconds respectively.

Examples

The following example shows how to configure a router with the delay, hold, and maximum interval values for the **timers throttle spf** command set at 5, 1000, and 90,000 milliseconds, respectively.

```
router ospf 1
router-id 10.10.10.2
```

```
log-adjacency-changes
timers throttle spf 5 1000 90000
redistribute static subnets
network 10.21.21.0 0.0.0.255 area 0
network 10.22.22.0 0.0.0.255 area 00
```

The following example shows how to configure a router using IPv6 with the delay, hold, and maximum interval values for the **timers throttle spf** command set at 500, 1000, and 10,000 milliseconds, respectively.

```
ipv6 router ospf 1
event-log size 10000 one-shot
log-adjacency-changes
timers throttle spf 500 1000 10000
```

Related Commands

| Command | Description |
|-----------------------------|---|
| ospfv3 network manet | Sets the network type to Mobile Ad Hoc Network (MANET). |

topology (EIGRP)

To configure an EIGRP process to route IP traffic under the specified topology instance and to enter address-family topology configuration mode, use the **topology** command in address-family configuration mode. To disassociate the EIGRP routing process from the topology instance, use the **no** form of this command.

topology {**base** | *topology-name* **tid** *number*}
no topology *topology-name*

Syntax Description

| | |
|--------------------------|---|
| base | Specifies the base topology. |
| <i>topology-name</i> | Topology name. This value is case-sensitive. |
| tid <i>number</i> | Specifies the topology ID number. The range is from 1 to 65535. |

Command Default

EIGRP routing processes are not configured to route IP traffic under a topology instance.

Command Modes

Address-family configuration (config-router-af)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines

Use this **topology** command in a Multitopology Routing (MTR) configuration to enable an EIGRP process under the specified topology. Enter the **topology** command under address-family configuration mode. Command configurations can be applied only to the topology instance. The topology must be defined globally with the **global-address-family** command in global address-family configuration mode before the topology can be configured under the EIGRP process.

The **tid** keyword associates an ID with the topology instance. Each topology must be configured with a unique topology ID, which is used to identify and group Network Layer Reachability Information (NLRI) for each topology in EIGRP updates.

The topology ID must be consistent across devices so that EIGRP can correctly associate topologies.

Examples

The following example shows how to configure EIGRP process 1 to route traffic for the 192.168.0.0/16 network under the VOICE topology instance:

```
Device> enable
Device# configure terminal
Device(config)# router eigrp 1
Device(config-router)# address-family ipv4 unicast autonomous-system 3
Device(config-router-af)# topology VOICE tid 100
Device(config-router-af-topology)# no auto-summary
Device(config-router-af-topology)# network 192.168.0.0 0.0.255.255
Device(config-router-af-topology)# end
```

Related Commands

| Command | Description |
|-----------------------------------|---|
| address-family ipv4 | Configures EIGRP for MTR. |
| clear ip eigrp | Resets EIGRP process and neighbor session information. |
| global-address-family ipv4 | Enters global address family configuration mode to configure MTR. |
| router eigrp | Configures the EIGRP routing process. |
| topology | Configures an MTR topology instance on an interface. |

aaa accounting

To enable authentication, authorization, and accounting (AAA) accounting of requested services for billing or security purposes when you use RADIUS or TACACS+, use the **aaa accounting** command in global configuration mode. To disable AAA accounting, use the **no** form of this command.

```
aaa accounting {auth-proxy | system | network | exec | connections | commands level}
{default | list-name} {start-stop | stop-only | none} [broadcast] group group-name
no aaa accounting {auth-proxy | system | network | exec | connections | commands level}
{default | list-name} {start-stop | stop-only | none} [broadcast] group group-name
```

Syntax Description

| | |
|----------------------------------|---|
| auth-proxy | Provides information about all authenticated-proxy user events. |
| system | Performs accounting for all system-level events not associated with users, such as reloads. |
| network | Runs accounting for all network-related service requests. |
| exec | Runs accounting for EXEC shell session. This keyword might return user profile information such as what is generated by the autocommand command. |
| connection | Provides information about all outbound connections made from the network access server. |
| commands level | Runs accounting for all commands at the specified privilege level. Valid privilege level entries are integers from 0 through 15. |
| default | Uses the listed accounting methods that follow this argument as the default list of methods for accounting services. |
| <i>list-name</i> | Character string used to name the list of at least one of the accounting methods described in |
| start-stop | Sends a "start" accounting notice at the beginning of a process and a "stop" accounting notice at the end of a process. The "start" accounting record is sent in the background. The requested user process begins regardless of whether the "start" accounting notice was received by the accounting server. |
| stop-only | Sends a "stop" accounting notice at the end of the requested user process. |
| none | Disables accounting services on this line or interface. |
| broadcast | (Optional) Enables sending accounting records to multiple AAA servers. Simultaneously sends accounting records to the first server in each group. If the first server is unavailable, fail over occurs using the backup servers defined within that group. |
| <i>group</i> <i>groupname</i> | At least one of the keywords described in the AAA Accounting Methods table. |

Command Default

AAA accounting is disabled.

Command Modes

Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **aaa accounting** command to enable accounting and to create named method lists defining specific accounting methods on a per-line or per-interface basis.

Table 191: AAA Accounting Methods

| Keyword | Description |
|--------------------------------|--|
| group radius | Uses the list of all RADIUS servers for authentication as defined by the aaa group server radius command. |
| group tacacs+ | Uses the list of all TACACS+ servers for authentication as defined by the aaa group server tacacs+ command. |
| group <i>group-name</i> | Uses a subset of RADIUS or TACACS+ servers for accounting as defined by the server group <i>group-name</i> . |

In AAA Accounting Methods table, the **group radius** and **group tacacs+** methods refer to a set of previously defined RADIUS or TACACS+ servers. Use the **radius server** and **tacacs server** commands to configure the host servers. Use the **aaa group server radius** and **aaa group server tacacs+** commands to create a named group of servers.

Cisco IOS XE software supports the following two methods of accounting:

- **RADIUS**—The network access server reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server.
- **TACACS+**—The network access server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server.

Method lists for accounting define the way accounting will be performed. Named accounting method lists enable you to designate a particular security protocol to be used on specific lines or interfaces for particular types of accounting services. Create a list by entering the *list-name* and the *method*, where *list-name* is any character string used to name this list (excluding the names of methods, such as radius or tacacs+) and *method* identifies the methods to be tried in sequence as given.

If the **aaa accounting** command for a particular accounting type is issued without a named method list specified, the default method list is automatically applied to all interfaces or lines (where this accounting type applies) except those that have a named method list explicitly defined. (A defined method list overrides the default method list.) If no default method list is defined, then no accounting takes place.

Note System accounting does not use named accounting lists; you can only define the default list for system accounting.

For minimal accounting, include the **stop-only** keyword to send a stop record accounting notice at the end of the requested user process. For more accounting, you can include the **start-stop** keyword, so that RADIUS or TACACS+ sends a start accounting notice at the beginning of the requested process and a stop accounting

notice at the end of the process. Accounting is stored only on the RADIUS or TACACS+ server. The `none` keyword disables accounting services for the specified line or interface.

When AAA accounting is activated, the network access server monitors either RADIUS accounting attributes or TACACS+ AV pairs pertinent to the connection, depending on the security method you have implemented. The network access server reports these attributes as accounting records, which are then stored in an accounting log on the security server.

Note This command cannot be used with TACACS or extended TACACS.

This example defines a default commands accounting method list, where accounting services are provided by a TACACS+ security server, set for privilege level 15 commands with a stop-only restriction:

```
Device> enable
Device# configure terminal
Device(config)# aaa accounting commands 15 default stop-only group TACACS+
Device(config)# exit
```

This example defines a default auth-proxy accounting method list, where accounting services are provided by a TACACS+ security server with a stop-only restriction. The `aaa accounting` commands activates authentication proxy accounting.

```
Device> enable
Device# configure terminal
Device(config)# aaa new model
Device(config)# aaa authentication login default group TACACS+
Device(config)# aaa authorization auth-proxy default group TACACS+
Device(config)# aaa accounting auth-proxy default start-stop group TACACS+
Device(config)# exit
```

aaa accounting dot1x

To enable authentication, authorization, and accounting (AAA) accounting and to create method lists defining specific accounting methods on a per-line or per-interface basis for IEEE 802.1x sessions, use the **aaa accounting dot1x** command in global configuration mode. To disable IEEE 802.1x accounting, use the **no** form of this command.

```
aaa accounting dot1x { name | default } start-stop { broadcast group { name | radius }
[ group { name | radius } ... ] | group { name | radius } [ group { name |
radius } ... ]}
no aaa accounting dot1x { name | default }
```

Syntax Description

| | |
|-------------------|---|
| name | Name of a server group. This is optional when you enter it after the broadcast group and group keywords. |
| default | Specifies the accounting methods that follow as the default list for accounting services. |
| start-stop | Sends a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested user process begins regardless of whether or not the start accounting notice was received by the accounting server. |
| broadcast | Enables accounting records to be sent to multiple AAA servers and sends accounting records to the first server in each group. If the first server is unavailable, the device uses the list of backup servers to identify the first server. |
| group | Specifies the server group to be used for accounting services. These are valid server group names: <ul style="list-style-type: none"> • name — Name of a server group. • radius — Lists of all RADIUS hosts. • tacacs+ — Lists of all TACACS+ hosts. <p>The group keyword is optional when you enter it after the broadcast group and group keywords. You can enter more than optional group keyword.</p> |
| radius | (Optional) Enables RADIUS accounting. |

Command Default

AAA accounting is disabled.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

This command requires access to a RADIUS server.

We recommend that you enter the **dot1x reauthentication** interface configuration command before configuring IEEE 802.1x RADIUS accounting on an interface.

This example shows how to configure IEEE 802.1x accounting:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa accounting dot1x default start-stop group radius
Device(config)# exit
```

aaa accounting identity

To enable authentication, authorization, and accounting (AAA) accounting for IEEE 802.1x, MAC authentication bypass (MAB), and web authentication sessions, use the **aaa accounting identity** command in global configuration mode. To disable IEEE 802.1x accounting, use the **no** form of this command.

```
aaa accounting identity {name | default} start-stop {broadcast group {name | radius | tacacs+}
[group {name | radius | tacacs+} ... ] | group {name | radius | tacacs+} [group
{name | radius | tacacs+}... ]}
no aaa accounting identity {name | default}
```

Syntax Description

| | |
|-------------------|---|
| name | Name of a server group. This is optional when you enter it after the broadcast group and group keywords. |
| default | Uses the accounting methods that follow as the default list for accounting services. |
| start-stop | Sends a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested-user process begins regardless of whether or not the start accounting notice was received by the accounting server. |
| broadcast | Enables accounting records to be sent to multiple AAA servers and send accounting records to the first server in each group. If the first server is unavailable, the switch uses the list of backup servers to identify the first server. |
| group | Specifies the server group to be used for accounting services. These are valid server group names: <ul style="list-style-type: none"> • name — Name of a server group. • radius — Lists of all RADIUS hosts. • tacacs+ — Lists of all TACACS+ hosts. <p>The group keyword is optional when you enter it after the broadcast group and group keywords. You can enter more than optional group keyword.</p> |
| radius | (Optional) Enables RADIUS authorization. |
| tacacs+ | (Optional) Enables TACACS+ accounting. |

Command Default

AAA accounting is disabled.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

To enable AAA accounting identity, you need to enable policy mode. To enable policy mode, enter the **authentication display new-style** command in privileged EXEC mode.

This example shows how to configure IEEE 802.1x accounting identity:

```
Device# authentication display new-style
```

Please note that while you can revert to legacy style configuration at any time unless you have explicitly entered new-style configuration, the following caveats should be carefully read and understood.

- (1) If you save the config in this mode, it will be written to NVRAM in NEW-style config, and if you subsequently reload the router without reverting to legacy config and saving that, you will no longer be able to revert.
- (2) In this and legacy mode, Webauth is not IPv6-capable. It will only become IPv6-capable once you have entered new-style config manually, or have reloaded with config saved in 'authentication display new' mode.

```
Device# configure terminal
```

```
Device(config)# aaa accounting identity default start-stop group radius
```

```
Device(config)# exit
```

aaa authentication dot1x

To specify one or more authentication, authorization, and accounting (AAA) methods for use on interfaces running IEEE 802.1x, use the **aaa authentication dot1x** command in global configuration mode. To disable authentication, use the **no** form of this command

```
aaa authentication dot1x { default listname } method1 [ method2 . . . ]
no aaa authentication dot1x { default listname } method1 [ method2 . . . ]
```

| Syntax Description | default | Uses the listed authentication methods that follow this argument as the default list of methods when a user logs in. |
|------------------------|---|---|
| | <i>listname</i> | Character string used to name the list of authentication methods tried when a user logs in. |
| | <i>method1</i> [<i>method2...</i>] | <p>A method can be least one of these keywords:</p> <ul style="list-style-type: none"> • enable: Uses the enable password for authentication. • group radius: Uses the list of all the RADIUS servers for authentication. • line: Uses the line password for authentication. • local: Uses the local username database for authentication. • local-case: Uses the case-sensitive local username database for authentication. • none: Uses no authentication. The client is automatically authenticated by the device without using the information supplied by the client. • group radius-server-group-name: Uses the group RADIUS server for authentication. • cache radius-server-group-name: Uses the cache RADIUS server for authentication. <p>Note You must configure the AAA authentication method list with both group radius-server-group-name and cache radius-server-group-name to use AAA cache-based authentication. For more information, see "Updating Authorization and Authentication Method Lists to Specify How Cache Information is Used" procedure of the "Configuring AAA Authorization and Authentication Cache" configuration guide.</p> |
| Command Default | No authentication is performed. | |
| Command Modes | Global configuration (config) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Cupertino 17.7.1 | This command was modified. The cache keyword was introduced. |

Usage Guidelines

The *method* argument identifies the list of methods that the authentication algorithm runs in the given sequence to validate the password provided by the client. The only method that is truly 802.1x-compliant is the **group radius** method, in which the client data is validated against a RADIUS authentication server. The remaining methods enable AAA to authenticate the client by using locally configured data. For example, the **local** and **local-case** methods use the username and password that are saved in the Cisco IOS configuration file. The **enable** and **line** methods use the **enable** and **line** passwords for authentication.

If you specify **group radius**, you must configure the RADIUS server by entering the **radius server** *server-name* global configuration command. If you are not using a RADIUS server, you can use the **local** or **local-case** methods, which access the local username database to perform authentication. By specifying the **enable** or **line** methods, you can supply the client with a password to provide access to the device.

Use the **show running-config** privileged EXEC command to display the configured lists of authentication methods.

Examples

The following example shows how to enable AAA and how to create an authentication list for 802.1x:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa group server radius RASERV
Device(config)# server name RASERV-1
Device(config)# aaa authentication dot1x default group RASERV
```

Related Commands

| Command | Description |
|---------------------------------|--|
| debug dot1x | Displays 802.1x debugging information. |
| identity profile default | Creates an identity profile and enters dot1x profile configuration mode. |
| show dot1x | Displays details for an identity profile. |

aaa common-criteria policy

To configure the AAA common criteria security policies, use the **aaa common-criteria policy** command in global configuration mode. To disable the AAA common criteria policies, use the **no** form of this command.

aaa common-criteria policy *policy-name*
no aaa common-criteria policy *policy-name*

Syntax Description *policy-name* Name of the AAA common criteria security policy.

Command Default The common criteria security policy is disabled.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|--|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Dublin 17.10.1 | This command was modified. The character-repetition and restrict-consecutive-letters keywords were introduced. |

Usage Guidelines Use the **aaa common-criteria policy** command to enter the common criteria configuration policy mode. To check the available options in this mode, type **?** after entering into common criteria configuration policy mode (config-cc-policy).

The following options are available:

- **char-change**: Change the number of characters between the old and new passwords. The range is from 1 to 64, and the default value is 4.
- **copy**: Copy the common criteria policy parameters from an existing policy.
- **exit**: Exit from common criteria configuration mode.
- **lifetime**: Configure the maximum lifetime of a password by providing the configurable value, in years, months, days, hours, minutes, and seconds. If the lifetime parameter is not configured, the password will never expire.

Note The **lifetime** option of the AAA common criteria policy is not supported for the **enable password** command.

- **lower-case**: Number of lowercase characters. The range is from 0 to 64.
- **upper-case**: Number of uppercase characters. The range is from 0 to 64.
- **min-length**: Minimum length of the password. The range is from 1 to 64, and the default value is 1.
- **max-length**: Maximum length of the password. The range is from 1 to 127, and the default value is 127.
- **numeric-count**: Number of numeric characters. The range is from 0 to 64.

- **special-case**: Number of special characters. The range is from 0 to 64.
- **character-repetition**: Maximum number of times a character can repeat consecutively in password. The range is from 2 to 5.
- **restrict-consecutive-letters**: Prohibit consecutive 4 characters or numbers from the keyboard sequentially in either directions.

Note When you use the **aaa password restriction** command, the security checks require your password to have atleast one of the four classes. The classes are categorised by uppercase, lowercase, numeric and special character. When you use both **aaa password restriction** and **aaa common-criteria policy** commands together, all the checks are run for the **aaa password restriction** command first and then the common criteria validation takes place.

The character repetition functionality configured under **aaa common-criteria policy** command takes precedence over the **aaa password restriction** command when both are configured together. The character repetition option allows you to choose the count value when you configure under the **aaa common-criteria policy** command.

The **login password-reuse-interval** command cannot store old passwords across device reboots. Using common criteria policy command helps to store five recently changed passwords across device reboots.

Examples

The following example shows how to create a common criteria security policy:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa common-criteria policy policy1
Device(config-cc-policy)# end
```

Related Commands

| Command | Description |
|--|---|
| aaa new-model | Enables AAA access control model. |
| debug aaa common-criteria | Enables debugging for AAA common criteria password security policies. |
| show aaa common-criteria policy | Displays common criteria security policy details. |

aaa new-model

To enable the authentication, authorization, and accounting (AAA) access control model, issue the **aaa new-model** command in global configuration mode. To disable the AAA access control model, use the **no** form of this command.

aaa new-model
no aaa new-model

Syntax Description This command has no arguments or keywords.

Command Default AAA is not enabled.

Command Modes Global configuration (config)

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command enables the AAA access control system.

If the **login local** command is configured for a virtual terminal line (VTY), and the **aaa new-model** command is removed, you must reload the switch to get the default configuration or the **login** command. If the switch is not reloaded, the switch defaults to the **login local** command under the VTY.

Note We do not recommend removing the **aaa new-model** command. This command is required for dot1x.

Examples

The following example initializes AAA:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# exit
```

The following example shows a VTY configured and the **aaa new-model** command removed:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# line vty 0 15
Device(config-line)# login local
Device(config-line)# exit
Device(config)# no aaa new-model
Device(config)# exit
Device# show running-config | b line vty

line vty 0 4
 login local !<=== Login local instead of "login"
line vty 5 15
 login local
```

!

| Related Commands | Command | Description |

| | aaa authentication login | Sets AAA authentication at login. |
| | aaa authentication ppp | Specifies one or more AAA authentication method for use on serial interfaces running PPP. |
| | aaa authorization | Sets parameters that restrict user access to a network. |

access-session host-mode multi-host

To allow hosts to gain access to a controlled port only after the first client is authenticated, use the **access-session host-mode multi-host** command in interface configuration mode. To return to the default value, use the **no** form of this command.

```
access-session host-mode multi-host [ peer ]
no access-session host-mode multi-host [ peer ]
```

| | | |
|---------------------------|--|---|
| Syntax Description | peer | Specifies that only a peer device can be authenticated first. |
| Command Default | Access to a port is multi-auth, wherein multiple clients can be authenticated on the port. | |
| Command Modes | Interface Configuration (config-if) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Cupertino 17.7.1 | The keyword peer was added. |

Usage Guidelines

Before you use this command, you must enable the **access-session port-control auto** command.

In multi-host mode, only one of the attached hosts has to be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (reauthentication fails or an Extensible Authentication Protocol over LAN (EAPOL) logoff message is received), all attached clients are denied access to the network.

Starting Cisco IOS XE Release 17.7.1, you can enable a peer device to be authenticated first, using the **access-session host-mode multi-host peer** command.

Consider a Cisco SD-Access fabric network where an extended node and its clients have to be securely onboarded. We must ensure that until the extended node is authenticated, the clients connected to it do not have access to the network. In such a case, use the **access-session host-mode multi-host peer** command to authenticate the extended node first. (The extended node is the peer device that is connected to the authenticator port.) Cisco ISE pushes this CLI through an interface template that is applied to the fabric edge node for IEEE 802.1X authentication. A change in the host mode clears all the existing sessions on the fabric edge. We recommend enabling the **access-session interface-template sticky timer** command in the global configuration mode to avoid the template from getting unbound from the edge node port. The sticky timer value should be a minimum of 60 seconds to avoid the bind-unbind loop issues. The interface template is unbound after the sticky timer expires.

Similarly, in cases where trunk ports are connected to the access device, use the **access-session host-mode multi-host peer** command to authenticate only the peer MAC. This avoids authenticating all the MAC addresses learnt.

Note The keyword **peer** is supported only in the fabric edge mode. It is not supported in the legacy mode. The peer configuration clears all the existing sessions on the authenticator port.

You can use the **show access-session interface** command to verify the port setting.

Example

The following example shows how to enable authorization of only the peer device on port1/0/2.

```
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/2
Device(config-if)# access-session host-mode multi-host peer
Device(config-if)# access-session closed
Device(config-if)# access-session port-control auto
```

Related Commands

| | |
|------------------------------------|---|
| access-session closed | Prevents preauthentication access on a port. |
| access-session port-control | Sets the authorization state of a port. |
| show access-session | Displays information about authentication sessions. |

authentication host-mode

To set the authorization manager mode on a port, use the **authentication host-mode** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

authentication host-mode { **multi-auth** | **multi-domain** | **multi-host** | **single-host** }
no authentication host-mode

| Syntax Description | | |
|---------------------|--|--|
| multi-auth | | Enables multiple-authorization mode (multi-auth mode) on the port. |
| multi-domain | | Enables multiple-domain mode on the port. |
| multi-host | | Enables multiple-host mode on the port. |
| single-host | | Enables single-host mode on the port. |

Command Default Single host mode is enabled.

Command Modes Interface configuration (config-if)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Single-host mode should be configured if only one data host is connected. Do not connect a voice device to authenticate on a single-host port. Voice device authorization fails if no voice VLAN is configured on the port.

Multi-domain mode should be configured if data host is connected through an IP phone to the port. Multi-domain mode should be configured if the voice device needs to be authenticated.

Multi-auth mode should be configured to allow devices behind a hub to obtain secured port access through individual authentication. Only one voice device can be authenticated in this mode if a voice VLAN is configured.

Multi-host mode also offers port access for multiple hosts behind a hub, but multi-host mode gives unrestricted port access to the devices after the first user gets authenticated.

This example shows how to enable multi-auth mode on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication host-mode multi-auth
Device(config-if)# end
```

This example shows how to enable multi-domain mode on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication host-mode multi-domain
Device(config-if)# end
```

This example shows how to enable multi-host mode on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication host-mode multi-host
Device(config-if)# end
```

This example shows how to enable single-host mode on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication host-mode single-host
Device(config-if)# end
```

You can verify your settings by entering the **show authentication sessions interface *interface* details** privileged EXEC command.

authentication logging verbose

To filter detailed information from authentication system messages, use the **authentication logging verbose** command in global configuration mode on the switch stack or on a standalone switch.

authentication logging verbose
no authentication logging verbose

Syntax Description This command has no arguments or keywords.

Command Default Detailed logging of system messages is not enabled.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command filters details, such as anticipated success, from authentication system messages. Failure messages are not filtered.

To filter verbose authentication system messages:

```
Device> enable
Device# configure terminal
Device(config)# authentication logging verbose
Device(config)# exit
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

Related Commands

| Command | Description |
|---------------------------------------|--|
| authentication logging verbose | Filters details from authentication system messages. |
| dot1x logging verbose | Filters details from dot1x authentication system messages. |
| mab logging verbose | Filters details from MAB authentication system messages. |

authentication mac-move permit

To enable MAC move on a device, use the **authentication mac-move permit** command in global configuration mode. To disable MAC move, use the **no** form of this command.

authentication mac-move permit
no authentication mac-move permit

Syntax Description This command has no arguments or keywords.

Command Default MAC move is disabled.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The command enables authenticated hosts to move between any authentication-enabled ports (MAC authentication bypass [MAB], 802.1x, or Web-auth) on a device. For example, if there is a device between an authenticated host and port, and that host moves to another port, the authentication session is deleted from the first port, and the host is reauthenticated on the new port.

If MAC move is disabled, and an authenticated host moves to another port, it is not reauthenticated, and a violation error occurs.

This example shows how to enable MAC move on a device:

```
Device> enable
Device# configure terminal
Device(config)# authentication mac-move permit
Device(config)# exit
```

| Related Commands | Command | Description |
|------------------|-------------------------------------|--|
| | access-session mac-move deny | Disables MAC move on a device. |
| | authentication event | Sets the action for specific authentication events. |
| | authentication fallback | Configures a port to use web authentication as a IEEE 802.1x authentication. |
| | authentication host-mode | Sets the authorization manager mode on a port. |
| | authentication open | Enables or disables open access on a port. |
| | authentication order | Sets the order of authentication methods used on a port. |
| | authentication periodic | Enable or disables reauthentication on a port. |
| | authentication port-control | Enables manual control of the port authorization. |

| Command | Description |
|---------------------------------|--|
| authentication priority | Adds an authentication method to the port-priority list. |
| authentication timer | Configures the timeout and reauthentication parameters. |
| authentication violation | Configures the violation modes that occur when a network device connects to a port with the maximum number of authentication failures. |
| show authentication | Displays information about authentication manager. |

authentication priority

To add an authentication method to the port-priority list, use the **authentication priority** command in interface configuration mode. To return to the default, use the **no** form of this command.

```
authentication priority [dot1x | mab] {webauth}
no authentication priority [dot1x | mab] {webauth}
```

| Syntax Description | dot1x | (Optional) Adds 802.1x to the order of authentication methods. |
|--------------------|---------|---|
| | mab | (Optional) Adds MAC authentication bypass (MAB) to the order of authentication methods. |
| | webauth | Adds web authentication to the order of authentication methods. |

Command Default The default priority is 802.1x authentication, followed by MAC authentication bypass and web authentication.

Command Modes Interface configuration (config-if)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Ordering sets the order of methods that the device attempts when trying to authenticate a new device is connected to a port.

When configuring multiple fallback methods on a port, set web authentication (webauth) last.

Assigning priorities to different authentication methods allows a higher-priority method to interrupt an in-progress authentication method with a lower priority.

Note If a client is already authenticated, it might be reauthenticated if an interruption from a higher-priority method occurs.

The default priority of an authentication method is equivalent to its position in execution-list order: 802.1x authentication, MAC authentication bypass (MAB), and web authentication. Use the **dot1x**, **mab**, and **webauth** keywords to change this default order.

This example shows how to set 802.1x as the first authentication method and web authentication as the second authentication method:

```
Device(config-if)# authentication priority dot1x webauth
```

This example shows how to set MAB as the first authentication method and web authentication as the second authentication method:

```
Device> enable
Device# configure terminal
```

```

Device(config)# interface gigabitethernet 0/1/2
Device(config-if)# authentication priority mab webauth
Device(config-if)# end

```

| authentication timer reauthenticate | Specifies the period of time between which the Auth Manager attempts to reauthenticate a user. |
| authentication timer restart | Specifies the period of time after which the Auth Manager attempts to reauthenticate a user. |
| authentication violation | Specifies the action to be taken when a security violation occurs on a port. |
| mab | Enables MAC authentication bypass on a port. |
| show authentication registrations | Displays information about the authentication methods that are registered on a port. |
| show authentication sessions | Displays information about current Auth Manager sessions. |
| show authentication sessions interface | Displays information about the Auth Manager for a given interface. |

authentication timer reauthenticate

To specify the period of time between which the Auth Manager attempts to reauthenticate authorized ports, use the **authenticationtimerreauthenticate** command in interface configuration or template configuration mode. To reset the reauthentication interval to the default, use the **no** form of this command.

```
authentication timer reauthenticate { seconds | server }
```

```
no authentication timer reauthenticate
```

Syntax Description

seconds The number of seconds between reauthentication attempts. The range is from 1 to 1073741823. The default is 3600 seconds.

server Specifies that the interval between reauthentication attempts is defined by the Session-Timeout value (RADIUS Attribute 27) on the authentication, authorization, and accounting (AAA) server.

Command Default

The automatic reauthentication interval is set to 3600 seconds.

Command Modes

Interface configuration (config-if)

Command History

| Release | Modification |
|-------------------------------|---|
| Cisco IOS XE Everest 16.5.1a | This command was introduced |
| Cisco IOS XE Bengaluru 17.5.1 | The supported time-out range was increased from 65535 seconds to 1073741823 seconds |

Usage Guidelines

Use the command **authenticationtimer reauthenticate** command to set the automatic reauthentication interval of an authorized port. If you use the **authenticationtimerinactivity** command to configure an inactivity interval, configure the reauthentication interval to be longer than the inactivity interval.

In releases prior to Cisco IOS XE Bengaluru 17.5.1, the supported timeout range is 1 to 65535 seconds. While downgrading from or releases after Cisco IOS XE Bengaluru 17.5.1 set the configuration timeout to supported values to avoid ISSD breakage.

Examples

The following example shows how to set the reauthentication interval on a port to 1800 seconds:

```
Device >enable
Device #configure terminal
Device(config)#interface gigabitethernet2/0/1
Device(config-if)#authentication timer reauthenticate 1800
Device(config-if)#end
```

Related Commands

| Command | Description |
|--------------------------------------|---|
| authenticationperiodic | Enables automatic reauthentication. |
| authenticationtimerinactivity | Specifies the interval after which the Auth Manager ends an inactive session. |

| Command | Description |
|-----------------------------------|--|
| authenticationtimerrestart | Specifies the interval after which the Auth Manager attempts to authenticate an unauthorized port. |

authentication violation

To configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port, use the **authentication violation** command in interface configuration mode.

```
authentication violation { protect | replace | restrict | shutdown }
no authentication violation { protect | replace | restrict | shutdown }
```

| Syntax Description | protect | Drops unexpected incoming MAC addresses. No syslog errors are generated. |
|--------------------|----------|--|
| | replace | Removes the current session and initiates authentication with the new host. |
| | restrict | Generates a syslog error when a violation error occurs. |
| | shutdown | Error-disables the port or the virtual port on which an unexpected MAC address occurs. |

Command Default Authentication violation shutdown mode is enabled.

Command Modes Interface configuration (config-if)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **authentication violation** command to specify the action to be taken when a security violation occurs on a port.

This example shows how to configure an IEEE 802.1x-enabled port as error-disabled and to shut down when a new device connects it:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication violation shutdown
Device(config-if)# end
```

This example shows how to configure an 802.1x-enabled port to generate a system error message and to change the port to restricted mode when a new device connects to it:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication violation restrict
Device(config-if)# end
```

This example shows how to configure an 802.1x-enabled port to ignore a new device when it connects to the port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication violation protect
Device(config-if)# end
```

This example shows how to configure an 802.1x-enabled port to remove the current session and initiate authentication with a new device when it connects to the port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/1
Device(config-if)# authentication violation replace
Device(config-if)# end
```

You can verify your settings by entering the **show running-config interface** *interface-name* command.

cisp enable

To enable Client Information Signaling Protocol (CISP) on a device so that it acts as an authenticator to a supplicant device and a supplicant to an authenticator device, use the **cisp enable** global configuration command.

cisp enable
no cisp enable

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The link between the authenticator and supplicant device is a trunk. When you enable VTP on both devices, the VTP domain name must be the same, and the VTP mode must be server.

To avoid the MD5 checksum mismatch error when you configure VTP mode, verify that:

- VLANs are not configured on two different devices, which can be caused by two VTP servers in the same domain.
- Both devices have different configuration revision numbers.

This example shows how to enable CISP:

```
Device> enable
Device# configure terminal
Device(config)# cisp enable
Device(config)# exit
```

| Related Commands | Command | Description |
|------------------|--|--|
| | dot1x credentials <i>profile</i> | Configures a profile on a supplicant device. |
| | dot1x supplicant force-multicast | Forces 802.1X supplicant to send multicast packets. |
| | dot1x supplicant controlled transient | Configures controlled access by 802.1X supplicant. |
| | show cisp | Displays CISP information for a specified interface. |

clear aaa cache group

To clear an individual entry or all entries in the cache, use the **clear aaa cache group** command in privileged EXEC mode.

clear aaa cache group *name* { **profile** *name* | **all** }

Syntax Description

| | |
|----------------------------|---|
| <i>name</i> | Text string representing the name of a cache server group. |
| profile <i>name</i> | Specifies the name of an individual profile entry that must be cleared. |
| all | Specifies that all the profiles in the named cache group be cleared. |

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

To update an old record with profile cache settings and to remove an old record from the cache, clear the cache for the profile.

Examples

The following example shows how to clear all the cache entries in the localusers group:

```
Device# clear aaa cache group localusers all
```

Related Commands

| Command | Description |
|-----------------------------|---|
| show aaa cache group | Displays all the cache entries stored by the AAA cache. |

clear device-tracking database

To delete device-tracking database (binding table) entries, and clear counters, events, and messages, enter the **clear device-tracking** command in privileged EXEC mode.

```
clear device-tracking { counters [ interface interface_type_no | vlan vlan_id ] | database [ address
{ hostname | all } [ interface interface_type_no | policy policy_name | vlan vlan_id ] | interface
interface_type_no [ vlan vlan_id ] | mac mac_address [ interface interface_type_no | policy policy_name
| vlan vlan_id ] | policy policy_name | prefix { prefix | all } [ interface interface_type_no | policy
policy_name | vlan vlan_id ] | vlanid vlan_id ] | events | messages }
```

| Syntax | Description |
|--|---|
| counters | Clears device-tracking counters for the specified interface or VLAN. Counters are displayed in the show device-tracking counters all privileged EXEC command. |
| interface <i>interface_type_no</i> | Enter an interface type and number. Use the question mark (?) online help function to display the types of interfaces available on the device. The clear action is performed for the interface you specify. |
| vlan <i>vlan_id</i> | Enter a VLAN ID. The clear action is performed for the VLAN ID you specify. The valid value range is from 1 to 4095. |
| database | Clears dynamic entries in the binding table. Note Static entries configured by using the device-tracking binding vlan <i>vlan_id</i> command are not deleted. You can delete all the dynamic entries in the table, or optionally, you can specify one or more IP addresses, MAC addresses, IPv6 prefixes, entries on a particular interface or VLAN, or a policy. |
| <i>hostname</i> | Enter the hostname or IP address on which you want to perform the clear action. |
| all | Performs the clear action on all IP addresses or IPv6 prefixes. |
| policy <i>policy_name</i> | Performs the clear action on the specified policy. Enter the policy name. |
| mac <i>mac_address</i> | Performs the clear action on the specified MAC address. Enter the MAC address. |
| prefix <i>prefix</i> | Performs the clear action on the specified IPv6 prefix. Enter a prefix or enter all to indicate all prefixes. |
| events | Clears the device-tracking events history. Events are displayed in the show device-tracking events privileged EXEC command. |
| messages | Clears the device-tracking message history. Events are displayed in the show device-tracking messages privileged EXEC command. |

Command Default

Database entries go through their binding entry lifecycle.

Counters: Each counter is a nonnegative 32-bit integer and it wraps-around when the limit is reached.

Events and messages: After the limit of 255 is reached, starting with the oldest, events and messages are overwritten.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example shows you how to clear all entries from the binding table.

```
Device# show device-tracking database Binding Table has 25 entries, 25 dynamic (limit 200000)
Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol,
DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created
Preflevel flags (prlvl):
0001:MAC and LLA match      0002:Orig trunk          0004:Orig access
0008:Orig trusted trunk    0010:Orig trusted access 0020:DHCP assigned
0040:Cga authenticated     0080:Cert authenticated  0100:Statically assigned
```

| prlvl | age | Network Layer Address | state | Time left | Link Layer Address | Interface | vlan |

```

clear errdisable interface vlan

To reenable a VLAN that was error-disabled, use the **clear errdisable interface** command in privileged EXEC mode.

```
clear errdisable interface interface-id vlan [vlan-list]
```

| Syntax Description | | |
|--------------------|---------------------|---|
| | <i>interface-id</i> | Specifies an interface. |
| | <i>vlan list</i> | (Optional) Specifies a list of VLANs to be reenabled. I |

Command Default No default behavior or values.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines You can reenable a port by using the **shutdown** and **no shutdown** interface configuration commands, or you can clear error-disable for VLANs by using the **clear errdisable** interface command.

Examples

This example shows how to reenable all VLANs that were error-disabled on Gigabit Ethernet port 4/0/2:

```
Device# clear errdisable interface gigabitethernet4/0/2 vlan
```

| Related Commands | Command | Description |
|------------------|--|-----------------------------------|
| | errdisable detect cause | Enables error-disabled detection |
| | errdisable recovery | Configures the recovery mecha |
| | show errdisable detect | Displays error-disabled detectio |
| | show errdisable recovery | Displays error-disabled recover |
| | show interfaces status err-disabled | Displays interface status of a li |

clear fqdn

To clear the fully qualified domain name (FQDN) local cache entries, use the **clear fqdn** command in privileged EXEC mode.

```
clear fqdn { database { all | fqdn name [ ipv4 address | ipv6 address ] } | packet statistics }
```

Syntax Description

| | |
|---------------------------|--|
| database all | Clears all the FQDN local cache entries. |
| database fqdn name | Clears the specified FQDN local cache entry. |
| ipv4 address | Clears a particular IP binding matched to the FQDN name. |
| ipv6 address | Clears a particular IPv6 binding matched to the FQDN name. |
| packet statistics | Resets all the FQDN packet statistics counters to 0. |

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-------------------------------|--|
| Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |
| Cisco IOS XE Bengaluru 17.6.1 | This command was modified. The ipv6 keyword was introduced. |

Examples

The following example shows how to clear all the FQDN local cache entries:

```
Device> enable
Device# clear fqdn database all
```

The following example shows how to clear a particular IPv4 binding matched to an FQDN name:

```
Device> enable
Device# clear fqdn database fqdn 123.cisco.com ipv4 10.102.103.10
```

The following example shows how to clear a particular IPv6 binding matched to an FQDN name:

```
Device> enable
Device# clear fqdn database fqdn 123.cisco.com ipv6 2001:DB8::1
```

clear mac address-table

To delete from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, all dynamic addresses on stack members, or all dynamic addresses on a particular VLAN, use the **clear mac address-table** command in privileged EXEC mode. This command also clears the MAC address notification global counters.

```
clear mac address-table { dynamic [address mac-addr | interface interface-id | vlan vlan-id]
| move update | notification }
```

| Syntax Description | | |
|--------------------------------------|--|---|
| dynamic | | Deletes all dynamic MAC addresses. |
| address <i>mac-addr</i> | | (Optional) Deletes the specified dynamic MAC address. |
| interface <i>interface-id</i> | | (Optional) Deletes all dynamic MAC addresses on the specified interface. |
| vlan <i>vlan-id</i> | | (Optional) Deletes all dynamic MAC addresses for the specified VLAN. |
| move update | | Clears the MAC address table move-update counters. |
| notification | | Clears the notifications in the history table and resets the notification counters. |

Command Default No default behavior or values.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines You can verify that the information was deleted by entering the **show mac address-table** command.

This example shows how to remove a specific MAC address from the dynamic address table:

```
Device> enable
Device# clear mac address-table dynamic address 0008.0070.0007
```

| Related Commands | Command | Description |
|------------------|---|---|
| | mac address-table notification | Enables the MAC address notification feature. |
| | mac address-table move update { receive transmit } | Configures MAC address-table move update on the device. |
| | show mac address-table | Displays the MAC address table static and dynamic entries. |
| | show mac address-table move update | Displays the MAC address-table move update information on the device. |

| Command | Description |
|--|--|
| show mac address-table notification | Displays the MAC address notification settings for all interfaces or on the specified interface when the interface keyword is appended. |
| snmp trap mac-notification change | Enables the SNMP MAC address notification trap on a specific interface. |

confidentiality-offset

To enable MACsec Key Agreement protocol (MKA) to set the confidentiality offset for MACsec operations, use the **confidentiality-offset** command in MKA-policy configuration mode. To disable confidentiality offset, use the **no** form of this command.

confidentiality-offset
no confidentiality-offset

Syntax Description This command has no arguments or keywords.

Command Default Confidentiality offset is disabled.

Command Modes MKA-policy configuration (config-mka-policy)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example shows how to enable the confidentiality offset:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# confidentiality-offset
```

Related Commands

| Command | Description |
|----------------------------------|--|
| mka policy | Configures an MKA policy. |
| delay-protection | Configures MKA to use delay protection in sending MKPDU. |
| include-icv-indicator | Includes ICV indicator in MKPDU. |
| key-server | Configures MKA key-server options. |
| macsec-cipher-suite | Configures cipher suite for deriving SAK. |
| sak-rekey | Configures the SAK rekey interval. |
| send-secure-announcements | Configures MKA to send secure announcements in sending MKPDUs. |
| ssci-based-on-sci | Computes SSCI based on the SCI. |
| use-updated-eth-header | Uses the updated Ethernet header for ICV calculation. |

debug aaa cache group

To debug the caching mechanism and ensure that caching entries are cached from AAA server responses and found when queried, use the **debug aaa cache group** command in privileged EXEC mode.

debug aaa cache group

Syntax Description This command has no arguments or keywords.

Command Default Debug information for all the cached entries is displayed.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use this command to display debug information about cached entries.

Examples The following example displays the debug information about all the cached entries:

```
Device# debug aaa cache group
```

| Related Commands | Command | Description |
|------------------|------------------------------|---|
| | clear aaa cache group | Clears an individual entry or all the entries in the cache. |
| | show aaa cache group | Displays cache entries stored by the AAA cache. |

debug aaa dead-criteria transaction

To display authentication, authorization, and accounting (AAA) dead-criteria transaction values, use the **debugaaa dead-criteria transaction** command in privileged EXEC mode. To disable dead-criteria debugging, use the **no** form of this command.

debug aaa dead-criteria transaction
no debug aaa dead-criteria transaction

Syntax Description

This command has no arguments or keywords.

Command Default

If the command is not configured, debugging is not turned on.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Dead-criteria transaction values may change with every AAA transaction. Some of the values that can be displayed are estimated outstanding transaction, retransmit tries, and dead-detect intervals. These values are explained in the table below.

Examples

The following example shows dead-criteria transaction information for a particular server group:

```
Device> enable
Device# debug aaa dead-criteria transaction

AAA Transaction debugs debugging is on
*Nov 14 23:44:17.403: AAA/SG/TRANSAC: Computed Retransmit Tries: 10, Current Tries: 3,
Current Max Tries: 10
*Nov 14 23:44:17.403: AAA/SG/TRANSAC: Computed Dead Detect Interval: 10s, Elapsed Time:
317s, Current Max Interval: 10s
*Nov 14 23:44:17.403: AAA/SG/TRANSAC: Estimated Outstanding Transaction: 6, Current Max
Transaction: 6
```

The table below describes the significant fields shown in the display.

Table 192: debug aaa dead-criteria transaction Field Descriptions

| Field | Description |
|---------------------------|---|
| AAA/SG/TRANSAC | AAA server-group transaction. |
| Computed Retransmit Tries | Currently computed number of retransmissions before the server is marked as dead. |
| Current Tries | Number of successive failures since the last valid response. |
| Current Max Tries | Maximum number of tries since the last successful transaction. |

| Field | Description |
|-----------------------------------|--|
| Computed Dead Detect Interval | Period of inactivity (the number of seconds since the last successful transaction) that can elapse before the server is marked as dead. The period of inactivity starts when a transaction is sent to a server that is considered live. The dead-detect interval is the period that the device waits for responses from the server before the device marks the server as dead. |
| Elapsed Time | Amount of time that has elapsed since the last valid response. |
| Current Max Interval | Maximum period of inactivity since the last successful transaction. |
| Estimated Outstanding Transaction | Estimated number of transaction that are associated with the server. |
| Current Max Transaction | Maximum transaction since the last successful transaction. |

Related Commands

| Command | Description |
|------------------------------------|---|
| radius-server dead-criteria | Forces one or both of the criteria, used to mark a RADIUS server as dead, to be the indicated constant. |
| show aaa dead-criteria | Displays dead-criteria detection information for an AAA server. |

delay-protection

To configure MKA to use delay protection in sending MACsec Key Agreement Protocol Data Units (MKPDUs), use the **delay-protection** command in MKA-policy configuration mode. To disable delay protection, use the **no** form of this command.

delay-protection
no delay-protection

Syntax Description This command has no arguments or keywords.

Command Default Delay protection for sending MKPDUs is disabled.

Command Modes MKA-policy configuration (config-mka-policy)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example shows how to configure MKA to use delay protection in sending MKPDUs:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# delay-protection
```

| Related Commands | Command | Description |
|------------------|----------------------------------|--|
| | mka policy | Configures an MKA policy. |
| | confidentiality-offset | Sets the confidentiality offset for MACsec operations. |
| | include-icv-indicator | Includes ICV indicator in MKPDU. |
| | key-server | Configures MKA key-server options. |
| | macsec-cipher-suite | Configures cipher suite for deriving SAK. |
| | sak-rekey | Configures the SAK rekey interval. |
| | send-secure-announcements | Configures MKA to send secure announcements in sending MKPDUs. |
| | ssci-based-on-sci | Computes SSCI based on the SCI. |
| | use-updated-eth-header | Uses the updated Ethernet header for ICV calculation. |

deny (MAC access-list configuration)

To prevent non-IP traffic from being forwarded if the conditions are matched, use the **deny** command in MAC access-list extended configuration mode. To remove a deny condition from the named MAC access list, use the **no** form of this command.

```
deny {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv |
diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console
| mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-udp] [cos cos]
no deny {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv |
diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console
| mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-udp] [cos cos]
```

Syntax Description

| | |
|--|--|
| any | Denies any source or destination MAC address. |
| host <i>src-MAC-addr</i> <i>src-MAC-addr mask</i> | Defines a host MAC address and optional subnet mask. If a packet matches the defined address, non-IP traffic from that host is denied. |
| host <i>dst-MAC-addr</i> <i>dst-MAC-addr mask</i> | Defines a destination MAC address and optional subnet mask. If a packet matches the defined address, non-IP traffic to that host is denied. |
| <i>type mask</i> | (Optional) Specifies the EtherType number of a packet to identify the protocol of the packet. The type is 0 to 65535, specified in hexadecimal. The mask is a mask of don't care bits applied to the type. |
| aarp | (Optional) Specifies EtherType AppleTalk Address Resolution Protocol address to a network address. |
| amber | (Optional) Specifies EtherType DEC-Amber. |
| appletalk | (Optional) Specifies EtherType AppleTalk/EtherTalk. |
| dec-spanning | (Optional) Specifies EtherType Digital Equipment Corporation Spanning Tree Protocol. |
| decnet-iv | (Optional) Specifies EtherType DECnet Phase IV. |
| diagnostic | (Optional) Specifies EtherType DEC-Diagnostic. |
| dsm | (Optional) Specifies EtherType DEC-DSM. |
| etype-6000 | (Optional) Specifies EtherType 0x6000. |
| etype-8042 | (Optional) Specifies EtherType 0x8042. |
| lat | (Optional) Specifies EtherType DEC-LAT. |
| lavc-sca | (Optional) Specifies EtherType DEC-LAVC-SCA. |

| | |
|-------------------------------------|---|
| lsap <i>lsap-number mask</i> | (Optional) Specifies the LSAP number (0 to 6) to identify the protocol of the packet. <i>mask</i> is a mask of don't care bits applied to the LSAP number. |
| mop-console | (Optional) Specifies EtherType DEC-MOP Remote Console. |
| mop-dump | (Optional) Specifies EtherType DEC-MOP Dump. |
| msdos | (Optional) Specifies EtherType DEC-MSDOS. |
| mumps | (Optional) Specifies EtherType DEC-MUMPS. |
| netbios | (Optional) Specifies EtherType DEC-NetBIOS. |
| vines-echo | (Optional) Specifies EtherType Virtual Integrity Banyan Systems. |
| vines-ip | (Optional) Specifies EtherType VINES IP. |
| xns-idp | (Optional) Specifies EtherType Xerox Network System or an arbitrary EtherType in decimal, hexadecimal, or hexidecimal. |
| cos <i>cos</i> | (Optional) Specifies a class of service (CoS) number. CoS can be performed only in hardware. A hardware CoS is configured. |

Command Default

This command has no defaults. However, the default action for a MAC-named ACL is to deny.

Command Modes

MAC-access list extended configuration (config-ext-macl)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

You enter MAC-access list extended configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **host** keyword, you must enter an address mask.

When an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

To filter IPX traffic, you use the *type mask* or **lsap lsap mask** keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS XE terminology are listed in the table.

Table 193: IPX Filtering Criteria

| IPX Encapsulation Type | | Filter Criterion |
|------------------------|----------------|------------------|
| Cisco IOS XE Name | Novel Name | |
| arpa | Ethernet II | EtherType 0x8137 |
| snap | Ethernet-snap | EtherType 0x8137 |
| sap | Ethernet 802.2 | LSAP 0xE0E0 |
| novell-ether | Ethernet 802.3 | LSAP 0xFFFF |

This example shows how to define the named MAC extended access list to deny NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is denied.

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended mac_layer
Device(config-ext-macl)# deny any host 00c0.00a0.03fa netbios.
Device(config-ext-macl)# end
```

This example shows how to remove the deny condition from the named MAC extended access list:

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended mac_layer
Device(config-ext-macl)# no deny any 00c0.00a0.03fa 0000.0000.0000 netbios.
Device(config-ext-macl)# end
```

The following example shows how to deny all packets with EtherType 0x4321:

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended mac_layer
Device(config-ext-macl)# deny any any 0x4321 0
Device(config-ext-macl)# end
```

You can verify your settings by entering the **show access-lists** privileged EXEC command.

Related Commands

| Command | Description |
|---------------------------------|---|
| mac access-list extended | Creates an access list based on MAC addresses for |
| permit | Permits from the MAC access-list configuration. Permits non-IP traffic to be forwarded if conditions |
| show access-lists | Displays access control lists configured on a device |

device-role (IPv6 snooping)

To specify the role of the device attached to the port, use the **device-role** command in IPv6 snooping configuration mode. To remove the specification, use the **no** form of this command.

```
device-role {node | switch}
no device-role {node | switch}
```

Syntax Description

node Sets the role of the attached device to node.

switch Sets the role of the attached device to device.

Command Default

The device role is node.

Command Modes

IPv6 snooping configuration (config-ipv6-snooping)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **device-role** command specifies the role of the device attached to the port. By default, the device role is node.

The **switch** keyword indicates that the remote device is a switch and that the local switch is now operating in multiswitch mode; binding entries learned from the port will be marked with trunk_port preference level. If the port is configured as a trust-port, binding entries will be marked with trunk_trusted_port preference level.

This example shows how to define an IPv6 snooping policy name as policy1, place the device in IPv6 snooping configuration mode, and configure the device as the node:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# device-role node
Device(config-ipv6-snooping)# end
```

device-role (IPv6 nd inspection)

To specify the role of the device attached to the port, use the **device-role** command in neighbor discovery (ND) inspection policy configuration mode.

device-role {**host** | **switch**}

| Syntax Description | host | Sets the role of the attached device to host. |
|--------------------|---------------|---|
| | switch | Sets the role of the attached device to switch. |

Command Default The device role is host.

Command Modes ND inspection policy configuration (config-nd-inspection)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **device-role** command specifies the role of the device attached to the port. By default, the device role is host, and therefore all the inbound router advertisement and redirect messages are blocked.

The **switch** keyword indicates that the remote device is a switch and that the local switch is now operating in multiswitch mode; binding entries learned from the port will be marked with trunk_port preference level. If the port is configured as a trust-port, binding entries will be marked with trunk_trusted_port preference level.

The following example defines a Neighbor Discovery Protocol (NDP) policy name as policy1, places the device in ND inspection policy configuration mode, and configures the device as the host:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 nd inspection policy policy1
Device(config-nd-inspection)# device-role host
Device(config-nd-inspection)# end
```

device-tracking (interface config)

To enable SISF-based device tracking and attach the *default* policy to an interface or VLAN, or to enable the feature and attach a custom policy enter the **device-tracking** command in interface configuration mode. To detach the policy from the interface or VLAN and revert to default, use the **no** form of the command.

```
device-tracking [ attach-policy policy-name ] [ vlan { vlan-id | add vlan-id | all | except vlan-id | none
| remove vlan-id } ]
no device-tracking [ attach-policy policy-name ] [ vlan { vlan-id | add vlan-id | all | except vlan-id |
none | remove vlan-id } ]
```

Syntax Description

attach-policy *policy-name* Attaches the custom policy that you specify, to the interface and all VLANs.

vlan { *vlan-id* | **add** *vlan-id* | **all** | **except** *vlan-id* | **none** | **remove** *vlan-id* } Configures the VLAN list for the policy and attaches the custom policy to the specified VLANs. You can specify the following particulars:

- *vlan-id*: Enter one or more VLAN IDs. The custom policy is attached to all the VLAN IDs.
- **add***vlan-id*: Adds specified VLANs to the existing list of VLAN IDs. The custom policy is attached to all the VLAN IDs.
- **all**: Attaches the custom policy to all VLAN IDs. This is the default option.
- **except***vlan-id*: Attaches the custom policy to all VLAN IDs, except the ones you specify here.
- **none**: Does not attach the custom policy to any VLAN.

remove*vlan-id*: Removes specified VLANs from the existing list of VLAN IDs. The custom policy is attached only to the VLAN IDs in the list.

Command Default

SISF-based device tracking is disabled and a policy is not attached to the interface.

Command Modes

Interface configuration [Device((config-if)#)]

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

If you enter the **device-tracking** command in the interface configuration mode, without any other keywords, the system attaches the *default* policy the interface or VLAN. The default policy is a built-in policy with default settings; you cannot change any of the attributes of the default policy.

If you configure the **device-tracking attach-policy***policy-name* command in the interface configuration mode, you can specify a custom policy name. You must have created the custom policy in global configuration mode already. The policy is attached to the specified interface. You can then also specify the VLANs that you want to attach it to.

If you want to change the custom policy that is attached to a target, reconfigure the **device-tracking attach-policy***policy-name* command.

If you want to disable the feature on a particular target, enter the **no device-tracking** command in the interface configuration mode.

Examples

- [Example: Enabling SIFS-Based Device Tracking and Attaching the Default Policy, on page 1756](#)
- [Attaching a Custom Policy, on page 1756](#)
- [Example: Disabling SIFS-Based Device-Tracking , on page 1757](#)

Examples

The following example shows how to enable SIFS-based device tracking and attach the default policy to an interface. The default policy has default policy parameters, none of which can be changed:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface tengigabitethernet1/0/1
Device(config-if)# device-tracking
Device(config-if)# end

Device# show device-tracking policies detail
Target                Type Policy                Feature                Target range
Tel1/0/1               PORT default              Device-tracking vlan all
Tel1/0/2               PORT default              Device-tracking vlan all

Device-tracking policy default configuration:
 security-level guard
 device-role node
 gleaning from Neighbor Discovery
 gleaning from DHCP6
 gleaning from ARP
 gleaning from DHCP4
 NOT gleaning from protocol unkn
Policy default is applied on the following targets:
Target                Type Policy                Feature                Target range
Tel1/0/1               PORT default              Device-tracking vlan all
Tel1/0/2               PORT default              Device-tracking vlan all
```

Examples

The following example shows how enable SIFS-based device tracking and attach a custom policy called `sisf-01`, to the same interface as the above example, that is, `Tel1/0/1`. Doing so replaces the existing default policy with custom policy `sisf-01` on `Tel1/0/1`.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface tengigabitethernet1/0/1
Device(config-if)# device-tracking attach-policy sif-01
Device(config-if)# end

Device# show device-tracking policies detail
Target                Type Policy                Feature                Target range
Tel1/0/1               PORT sif-01              Device-tracking vlan all
Tel1/0/2               PORT default              Device-tracking vlan all

Device-tracking policy default configuration:
```

```

security-level guard
device-role node
gleaning from Neighbor Discovery
gleaning from DHCP6
gleaning from ARP
gleaning from DHCP4
NOT gleaning from protocol unkn
Policy default is applied on the following targets:
Target          Type Policy          Feature          Target range
Tel/0/2         PORT default        Device-tracking vlan all
Device-tracking policy sisf-01 configuration:
security-level guard
device-role node
gleaning from Neighbor Discovery
gleaning from DHCP6
gleaning from ARP
gleaning from DHCP4
NOT gleaning from protocol unkn
limit address-count 3000
Policy sisf-01 is applied on the following targets:
Target          Type Policy          Feature          Target range
Tel/0/1         PORT sisf-01        Device-tracking vlan all

```

Examples

The following example shows how to disable SISF-based device-tracking on a target. The feature is disabled on target Te1/0/1. This is the same interface where a custom policy is applied in the previous example. The default policy continues to be available on the other interface where the feature is enabled, that is, Te1/0/2.

```

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface tengigabitethernet1/0/1
Device(config-if)# no device-tracking attach-policy sisf-01
Device(config-if)# end

Device# show device-tracking policies detail
Target          Type Policy          Feature          Target range
Tel/0/2         PORT default        Device-tracking vlan all

Device-tracking policy default configuration:
security-level guard
device-role node
gleaning from Neighbor Discovery
gleaning from DHCP6
gleaning from ARP
gleaning from DHCP4
NOT gleaning from protocol unkn
Policy default is applied on the following targets:
Target          Type Policy          Feature          Target range
Tel/0/2         PORT default        Device-tracking vlan all

```

device-tracking (VLAN config)

To enable Switch Integrated Security Features (SISF)-based device tracking and attach the *default* policy to a VLAN, or to enable the feature, attach a custom policy to a VLAN, and specify policy priority, enter the **device-tracking** command in VLAN configuration mode. To detach the policy from a VLAN and revert to default, use the **no** form of the command.

device-tracking [**attach-policy** *policy-name*] [**priority** *priority-value*]

| | | | |
|---------------------------------------|---|--|--|
| Syntax Description | attach-policy <i>policy-name</i> Attaches the custom policy that you specify, to the VLAN. | | |
| priority <i>priority-value</i> | Note | Although visible on the CLI, configuring this command has no effect. Policy priority is system-determined. You cannot change this. | |
| Command Default | SISF-based device tracking is disabled. | | |
| Command Modes | VLAN configuration mode [Device((config-vlan-config)#)] | | |
| Command History | Release | Modification | |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced | |

Usage Guidelines

If you enter the **device-tracking** command in VLAN configuration mode, without any other keywords, the system attaches the *default* policy to the VLAN. The default policy is a built-in policy with default settings; you cannot change any of the parameters of the default policy.

If you configure the **device-tracking attach-policy***policy-name* command in VLAN configuration mode, the custom policy you specify is attached to the VLAN. With a custom policy, you can configure certain parameters of a custom policy.

You can enable the feature and attach a policy - custom or default - to one or more VLANs or a range of VLANs.

Examples

- [Example: Enabling SISF-Based Device Tracking and Attaching the Default Policy, on page 1758](#)
- [Example: Attaching a Custom Policy to a VLAN, on page 1759](#)
- [Example: Attaching a Custom Policy to a Range of VLANs, on page 1759](#)

Examples

The following example shows how to enable SISF-based device tracking and attach the default policy to VLAN 500:

```
Device# show device-tracking policies
Target      Type Policy      Feature      Target range
Tel1/0/1    PORT sisf-03    Device-tracking vlan all
```

```
Tel/0/1          PORT default          Address Resolution Relay vlan all
Tel/0/2          PORT default          Device-tracking vlan all
vlan 333         VLAN sisf-01         Device-tracking vlan all
```

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)#vlan configuration 500
Device(config-vlan-config)# device-tracking
Device(config-vlan-config)# end
```

```
Device#show device-tracking policies
Target          Type Policy          Feature          Target range
Tel/0/1         PORT sisf-03        Device-tracking  vlan all
Tel/0/1         PORT default        Address Resolution Relay vlan all
Tel/0/2         PORT default        Device-tracking  vlan all
vlan 333        VLAN sisf-01        Device-tracking  vlan all
VLAN default          Device-tracking vlan all
```

Examples

The following example shows how to attach a custom policy called sisf-03, to the same VLAN as the above example, that is, VLAN 500. Doing so replaces the existing default policy with custom policy sisf-03 on the VLAN:

```
Device# show device-tracking policies
Target          Type Policy          Feature          Target range
Tel/0/1         PORT sisf-03        Device-tracking  vlan all
Tel/0/1         PORT default        Address Resolution Relay vlan all
Tel/0/2         PORT default        Device-tracking  vlan all
vlan 333        VLAN sisf-01        Device-tracking  vlan all
vlan 500        VLAN default        Device-tracking  vlan all
```

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# vlan configuration 500
Device(config-vlan-config)# device-tracking attach-policy sisf-03
Device(config-vlan-config)# end
```

```
Device# show device-tracking policies
Target          Type Policy          Feature          Target range
Tel/0/1         PORT sisf-03        Device-tracking  vlan all
Tel/0/1         PORT default        Address Resolution Relay vlan all
Tel/0/2         PORT default        Device-tracking  vlan all
vlan 333        VLAN sisf-01        Device-tracking  vlan all
VLAN sisf-03          Device-tracking vlan all
```

Examples

The following example shows how to attach a custom policy to a range of VLANs (VLANs 10 to 15):

```
Device(config)# vlan configuration 10-15
Device(config-vlan-config)#device-tracking attach-policy sisf-01
Device(config-vlan-config)#end
```

```
Device# show device-tracking policies
Target          Type Policy          Feature          Target range
Tel/0/2         PORT default        Device-tracking  vlan all
vlan 10         VLAN sisf-01        Device-tracking  vlan all
vlan 11         VLAN sisf-01        Device-tracking  vlan all
vlan 12         VLAN sisf-01        Device-tracking  vlan all
vlan 13         VLAN sisf-01        Device-tracking  vlan all
```

```
vlan 14          VLAN sif-01          Device-tracking vlan all
vlan 15          VLAN sif-01          Device-tracking vlan all
```

device-tracking binding

To specify how binding entries are maintained in the binding table, enter the **device-tracking binding** command in global configuration mode. With this command you can configure the lifetime of each state, the maximum number of entries allowed in a binding table, and whether binding entry events are logged. You can also use this command to configure static binding entries. To revert to the default value, use the **no** form of the command.

device-tracking binding { **down-lifetime** | **logging** | **max-entries** | **reachable-lifetime** | **stale-lifetime** | **vlan** }

For the sake of clarity, the remaining command string after each one of the above options is listed separately:

- **device-tracking binding down-lifetime** { *seconds* | **infinite** }

no device-tracking binding down-lifetime

- **device-tracking binding logging**

no device-tracking binding logging

- **device-tracking binding max-entries** *no_of_entries* [**mac-limit** *no_of_entries* | **port-limit** *no_of_entries* [**mac-limit** *no_of_entries*] | **vlan-limit** *no_of_entries* [**mac-limit** *no_of_entries* | **port-limit** *no_of_entries* [**mac-limit** *no_of_entries*]]]

no device-tracking binding max-entries

- **device-tracking binding reachable-lifetime** { *seconds* | **infinite** } [**down-lifetime** { *seconds* | **infinite** } | **stale-lifetime** { *seconds* | **infinite** } [**down-lifetime** { *seconds* | **infinite** }]]

no device-tracking binding reachable-lifetime

- **device-tracking binding stale-lifetime** { *seconds* | **infinite** } [**down-lifetime** { *seconds* | **infinite** }]

no device-tracking binding stale-lifetime

- **device-tracking binding vlan** *vlan_id* { *ipv4_add* *ipv6_add* *ipv6_prefix* } [**interface** *inteface_type_no*] [*48-bit-hardware-address*] [**reachable-lifetime** { *seconds* | **default** | **infinite** } | **tracking** { **default** | **disable** | **enable** [**retry-interval** { *seconds* | **default** }]] } [**reachable-lifetime** { *seconds* | **default** | **infinite** }]]

| | |
|---|---|
| Syntax Description | <p>down-lifetime { <i>seconds</i> infinite }</p> <p>Provides the option to configure a countdown timer for a binding entry in the DOWN state, or, to disable the timer.</p> <p>A binding entry enters the DOWN state when the host's connecting interface is administratively down. If a timer is configured, one of these events may occur before timer expiry - either the interface can be up again, or, the entry can <i>remain</i> in the DOWN state. If the interface is up before timer expiry, the timer is stopped, and the state of the entry changes. If the entry remains in the DOWN state after timer expiry, it is removed from the binding table. If the timer is disabled or turned off, the entry is never removed from the binding table and can remain in the DOWN state indefinitely, or until the interface is up again.</p> <p>Configure one of these options:</p> <ul style="list-style-type: none"> • seconds: Configure a value for the down-lifetime timer. Enter a value between 1 and 86400 seconds. The default value is 86400 seconds (24 hours). • infinite: Disables the timer for the DOWN state. This means that a timer is not started when an entry enters the DOWN state. |
| logging | Enables generation of logs for binding entry events. |
| <p>device-tracking binding max-entries [<i>no_of_entries</i> mac-limit <i>no_of_entries</i> port-limit <i>no_of_entries</i> vlan-limit <i>no_of_entries</i>]</p> | <p>Configures the maximum number of entries for a binding table. Enter a value between 1 and 200000. The default value is 200000.</p> <p>Note This limit applies only to dynamic entries and not static binding entries.</p> <p>Optionally, you can also configure these limits:</p> <ul style="list-style-type: none"> • mac-limit <i>no_of_entries</i>: Configures the maximum number of entries allowed per MAC address. Enter a value between 1 and 100000. By default, a limit is not set. • port-limit <i>no_of_entries</i>: Configures the maximum number of entries allowed per interface. Enter a value between 1 and 100000. By default, a limit is not set. • vlan-limit <i>no_of_entries</i>: Configures the maximum number of entries allowed per VLAN. Enter a value between 1 and 100000. By default, a limit is not set. <p>The no form of the command resets the max-entries value to 200000 and sets the mac-limit, port-limit, vlan-limit to "no limit".</p> |

reachable-lifetime {
seconds | **infinite** }

Provides the option to configure a countdown timer for a binding entry in the REACHABLE state, or, to disable the timer.

If a timer is configured, either one of these events may occur before timer expiry - incoming packets are received from the host, or there are no incoming packets from the host. Every time an incoming packet is received from the host, the timer is reset. If no incoming packets are received and the timer expires, then the state of the entry changes based on the reachability of the host. If the timer is disabled or turned off, the entry can remain in the REACHABLE state, indefinitely.

Configure one of these options:

- **seconds**: Configure a value for the reachable-lifetime timer. Enter a value between 1 and 86400 seconds. The default value is 300 seconds (5 minutes).
- **infinite**: Disables the timer for the REACHABLE state. This means that a timer is not started when an entry enters the REACHABLE state.

stale-lifetime { *seconds*
| **infinite** }

Provides the option to configure a countdown timer for a binding entry in the STALE state, or, to disable the timer.

If a timer is configured, either one of these events may occur before timer expiry - incoming packets are received from the host, or there are no incoming packets from the host. If an incoming packet is received, the timer is stopped and the entry transitions to a new state. If no incoming packets are received and the timer expires, then the entry is removed from the binding table. If the timer is disabled or turned off, the entry can remain in the STALE state, indefinitely.

If polling is enabled, a final attempt is made to probe the host at stale timer expiry.

Note If polling is enabled, polling occurs when the reachable lifetime timer expires (3 times), and then a final attempt at stale timer expiry as well. The time required to poll an entry after expiry of reachable lifetime, is subtracted from the stale lifetime.

Configure one of these options:

- **seconds**: Configure a value for the stale-lifetime timer. Enter a value between 1 and 86400 seconds. The default value is 86400 seconds (24 hours).
 - **infinite**: Disables the timer for the STALE state. This means that a timer is not started when an entry enters the STALE state.
-

device-tracking binding Creates a static binding entry in the binding table. You can also specify how static binding entries are maintained in the binding table.

```

vlan vlan_id { ipv4_add
ipv6_add ipv6_prefix }
 [ interface
  interface_type_no ] [
  48-bit-hardware-address
] [ reachable-lifetime
  { seconds | default |
infinite } | tracking {
default | disable |
enable [
retry-interval { seconds
| default } ] ] } [
reachable-lifetime {
seconds | default |
infinite } ] ]

```

Note The limit you configure for the **max-entries** *no_of_entries* option (above) does not apply to static binding entries. There is no limit to the number of static entries you can create.

- Enter an IP address or prefix:
 - *ipv4_add* : Enter an IPv4 address.
 - *ipv6_add* : Enter an IPv6 address.
 - *ipv6_prefix* : Enter an IPv6 prefix.
- **interface** *interface_type_no*: Enter an interface type and number. Use the question mark (?) online help function to display the types of interfaces available on the device.
- (Optional) *48-bit-hardware-address*: Enter a MAC address. If you do not configure a MAC address for the binding entry, any MAC address is allowed.
- (Optional) **reachable-lifetime** {*seconds* | **default** | **infinite** } : Configures the reachable lifetime settings for a static binding entry in the REACHABLE state. If you want to configure a reachable lifetime for a static binding entry, you must specify the MAC address for the entry.

If you do not configure a value, the same value as configured for **device-tracking binding reachable-lifetime** applies.

seconds: Configure a value for the reachable-lifetime timer. Enter a value between 1 and 86400 seconds. The default value is 300 seconds (5 minutes).

default: Uses the same value as configured for dynamic entries in the binding table.

infinite: Disables the timer for the REACHABLE state. This means that a timer is not started when a static binding entry enters the REACHABLE state.

- (Optional) **tracking** {**default** | **disable** | **enable** } : Configures polling related settings for a static binding entry.

default: Polling is disabled.

disable: Disables polling for a static binding entry.

enable: Enables polling for a static binding entry.

When you enable tracking, you also have the option to configure a **retry-interval**. This is a multiplicative factor or "base value", for the backoff algorithm. The backoff algorithm determines the wait time between the 3 polling attempts that occur after reachable lifetime expiry.

Enter a value between 1 and 3600 seconds. The default value is one.

Command Default

If you do not configure a value, the default values for down, reachable, and stale lifetimes, and maximum number of binding entries allowed in a binding table are applicable - as long as a policy-level value is not set. See the *Usage Guidelines* below for further details.

Command Modes

Global configuration [Device(config)#]

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **device-tracking binding** command enables you to specify how entries are maintained in a binding table, at a global level. The settings therefore apply to all interfaces and VLANs where SISF-based device-tracking is enabled. But for the system to start extracting binding information from packets that enter the network and to create binding entries to which the settings you configure here will apply, there must exist a policy that is attached an interface or VLAN.

If there is no policy on any interface or VLAN, the only entries that can exist in a binding table are any static binding entries you create.

Changing Any Binding Entry Setting

When you reconfigure a value or setting with the **device-tracking binding** command, the change applies only to subsequently created binding entries. The changed configuration does not apply to existing entries. The older setting applies to an older entry.

To display the current settings, enter the **show device-tracking database** command in privileged EXEC mode.

Global versus Policy-Level Settings

For some of the settings you configure with this command, there are policy level counterparts. (A policy level paramter is configured in the device-tracking configuration mode and applies only to that policy). The tables below clarifies when a globally configured value takes precedence and when a policy-level value takes precedence:

| Option under device-tracking binding global configuration command | Policy-level counterpart in the device-tracking configuration mode |
|--|--|
| device-tracking binding reachable-lifetime { seconds infinite } | tracking enable [reachable-lifetime [seconds infinite]] |
| Device(config)# device-tracking binding reachable-lifetime 2000 | Device(config)# device-tracking policy sisf-01 Device(config-device-tracking)# Device(config-device-tracking)# tracking enable reachable-lifetime 250 |
| <p>If a policy-level value <i>and</i> a globally configured value exists, the policy-level value applies.</p> <p>If only a globally configured value exists, the globally configured value applies.</p> <p>If only a policy-level value exists the policy-level value applies.</p> <p>See: Example: Configuring a Reachable, Stale, and Down Lifetime at the Global vs Policy Level, on page 1769.</p> | |

| Option under device-tracking binding global configuration command | Policy-level counterpart in the device-tracking configuration mode |
|---|--|
| device-tracking binding stale-lifetime { <i>seconds</i> infinite } | tracking disable [<i>stale-lifetime</i> [<i>seconds</i> infinite]] |
| Device(config)# device-tracking binding stale-lifetime 2000 | Device(config)# device-tracking policy sif-01 Device(config-device-tracking)# Device(config-device-tracking)# tracking enable stale-lifetime 500 |
| <p>If a policy-level value <i>and</i> a globally configured value exists, the policy-level value applies.</p> <p>If only a globally configured value exists, the globally configured value applies.</p> <p>If only a policy-level value exists the policy-level value applies.</p> <p>See: Example: Configuring a Reachable, Stale, and Down Lifetime at the Global vs Policy Level, on page 1769.</p> | |
| Option under device-tracking binding global configuration command | Policy-level counterpart in the device-tracking configuration mode |
| device-tracking binding max-entries <i>no_of_entries</i> [mac-limit <i>no_of_entries</i> port-limit <i>no_of_entries</i> vlan-limit <i>no_of_entries</i>] | limit address-count <i>ip-per-port</i> |
| Device(config)# device-tracking binding max-entries 30 vlan-limit 25 port-limit 20 mac-limit 19 | Device(config)# device-tracking policy sif-01 Device(config-device-tracking)# Device(config-device-tracking)# limit address-count 30 |
| <p>If a policy-level value <i>and</i> globally configured values exist, the creation of binding entries is stopped when a limit is reached - this can be one of the global values or the policy-level value.</p> <p>If only globally configured values exist, the creation of binding entries is stopped when a limit is reached.</p> <p>If only a policy-level value exists, the creation of binding entries is stopped when the policy-level limit is reached.</p> <p>Example: Global vs Policy-Level Address Limits, on page 1773.</p> | |
| Option under device-tracking binding global configuration command | Policy-level counterpart in the device-tracking configuration mode |
| device-tracking binding max-entries <i>no_of_entries</i> [mac-limit <i>no_of_entries</i>] | IPv4 per MAC and IPv6 per MAC While you cannot configure either one of the above limits in a policy, a programmatically created policy may have either one, both, or neither one of the limits. |

| Option under device-tracking binding global configuration command | Policy-level counterpart in the device-tracking configuration mode |
|---|---|
| <pre>Device(config)# device-tracking binding max-entries 300 mac-limit 3</pre> | <pre>Device# show device-tracking policy LISP-DT-GLEAN-VLAN Policy LISP-DT-GLEAN-VLAN configuration: security-level glean (*) device-role node gleaning from Neighbor Discovery gleaning from DHCP gleaning from ARP gleaning from DHCP4 NOT gleaning from protocol unkn limit address-count for IPv4 per mac 4 (*) limit address-count for IPv6 per mac 12 (*) tracking enable <output truncated></pre> |
| <p>If a policy-level value <i>and</i> globally configured values exists, the creation of binding entries is stopped when a limit is reached - this can be one of the global values or the policy-level value.</p> <p>If only globally configured values exist, the creation of binding entries is stopped when a limit is reached.</p> <p>If only a policy-level value exists, the creation of binding entries is stopped when the policy-level limit is reached.</p> | |

Configuring Down, Reachable, Stale Lifetimes

When you configure a non-default value for the **down-lifetime**, or **reachable-lifetime**, or **stale-lifetime** keywords, the system reverts the lifetimes that you do not configure, to default values. The following example clarifies this behaviour: [Example: Configuring Non-Default Values for Reachable, Stale, and Down Lifetimes, on page 1769](#).

To display the currently configured lifetime values, enter the **show running-config | include device-tracking** command in privileged EXEC mode.

Configuring MAC, Port, VLAN Limits

When you configure a non-default value for the **mac-limit**, or **port-limit**, or **vlan-limit** keywords, the system reverts the limits that you do not configure, to default values.

To configure all three limits in the same command line, first configure the VLAN limit, then the port limit, and finally the MAC limit:

```
Device(config)# device-tracking binding max-entries 15 vlan-limit 2 port-limit 20 mac-limit 5
```

You can also use this system behavior when you want to reset one or more - but not *all* limits, to their default values. Although the default for all three keywords is that there is no limit, you cannot enter the number "0" to set a limit to its default value. Zero is not within the valid value range for any of the limits. To reset one or more limits to their default values, leave out the corresponding keyword. The following example clarifies this behaviour: [Example: Setting VLAN, Port, and MAC Limits to Default Values, on page 1777](#).

Enabling Logging of Binding Entry Events

When you configure the **device-tracking binding logging** global configuration command to generate logs for binding entry events, you may also have to configure a few general logging settings, depending on your requirements:

- (Required) The **logging buffered informational** command in global configuration mode.

With this command you enable message logging at a device level and you specify a severity level. Configuring the command allows logs to be copied and stored to a local, internal buffer. Specifying a severity level causes messages at that level and numerically lower levels to be logged.

Logs generated for binding entry events have a severity level of 6 (meaning, informational). For example:

```
%SISF-6-ENTRY_CREATED: Entry created IP=192.0.2.24 VLAN=200 MAC=001b.4411.4ab6 I/F=Te1/0/4
Preflevel=00FF
```

- (Optional) The **logging console** command in global configuration mode.

With this command you send the logs to the console (all available TTY lines).

Caution A low severity level may cause the number of messages being displayed on the console to increase significantly. Further, the console is a slow display device. In message storms some logging messages may be silently dropped when the console queue becomes full. Set severity levels accordingly.

If you don't want to configure this command, you can view logs when required by entering the **show logging** command in privileged EXEC mode.

If the **logging console** command is not enabled, logs are not *displayed* on the device console, but if you have configured **device-tracking binding logging** and **logging buffered informational**, logs will be generated and available in the local buffer.

For information about the *kind* of binding entry events for which logs are generated, see the system message guide for the corresponding release: [System Message Guides](#). Search for SISF-6.

While the **device-tracking binding logging** command logs binding entry events, there is also the **device-tracking logging** command, which enables snooping security logging. The two command log different kinds of events and the generated logs have different severity levels.

Creating a Static Binding Entry

If there are silent but reachable hosts in the Layer 2 domain, and you want to retain binding information for these silent hosts, you can create static binding entries.

While there is no limit to the number of static entries you can create, these entries also contribute to the size of the binding table. Consider the number of such entries you require, before you create them.

You can create a static binding entry even if a policy is not attached to the interface or VLAN specified in the static binding entry.

When you configure a static binding entry followed by its settings (for example, reachable-lifetime), the configuration applies only to that static binding entry and not to any other entries, static or dynamic. The following example shows you how to create a static binding entry: [Example: Creating a Static Binding Entry, on page 1772](#).

Examples

- [Example: Configuring Non-Default Values for Reachable, Stale, and Down Lifetimes, on page 1769](#)
- [Example: Configuring a Reachable, Stale, and Down Lifetime at the Global vs Policy Level, on page 1769](#)

- [Example: Creating a Static Binding Entry, on page 1772](#)
- [Example: Global vs Policy-Level Address Limits, on page 1773](#)
- [Example: Setting VLAN, Port, and MAC Limits to Default Values, on page 1777](#)
- [Example: Global vs Policy-Level Limits Relating to MAC Addresses, on page 1778](#)

Example: Configuring Non-Default Values for Reachable, Stale, and Down Lifetimes

The following example clarifies system behaviour when you configure values for reachable, stale, and down lifetimes separately (the effect is not cumulative). It also shows you how to configure values in a way that configuration is retained for all the lifetimes.

In the first step of this example only a reachable-lifetime is configured. This means the down-lifetime and stale lifetime are set to default, because the **stale-lifetime** and **down-lifetime** keywords have been left out:

```
Device(config)# device-tracking binding reachable-lifetime 700
Device(config)# exit
Device# show running-config | include device-tracking
device-tracking policy sisf-01
  device-tracking attach-policy sisf-01
  device-tracking attach-policy sisf-01 vlan 200device-tracking binding reachable-lifetime
700
device-tracking binding logging
```

In the next step of this example, a stale-lifetime of 1500 seconds and a down-lifetime of 1000 seconds is configured. With this, the reachable-lifetime configured in the previous step, is to default:

```
Device(config)# device-tracking binding stale-lifetime 1500 down-lifetime 1000
Device(config)# exit
Device# show running-config | include device-tracking
device-tracking policy sisf-01
  device-tracking attach-policy sisf-01
  device-tracking attach-policy sisf-01 vlan 200device-tracking binding stale-lifetime 1500
  down-lifetime 1000
device-tracking binding logging
```

In the next step of this example, reachable, down, and stale lifetimes of 700, 1000, and 200 respectively, are configured. With this, the value for the stale-lifetime is changed from 1500 seconds, to 1000 seconds. The down-lifetime is changed from 1000 to 200. The reachable-lifetime is configured as 700 seconds.

```
Device(config)# device-tracking binding reachable-lifetime 700 stale-lifetime 1000
down-lifetime 200
Device(config)# exit
Device# show running-config | include device-tracking
device-tracking policy sisf-01
  device-tracking attach-policy sisf-01
  device-tracking attach-policy sisf-01 vlan 200device-tracking binding reachable-lifetime
700 stale-lifetime 1000 down-lifetime 200
device-tracking binding logging
```

If any one of the lifetimes requires a change and the values for the other lifetimes must be retained, all three keywords must be reconfigured with the required values - everytime, and in the same command line.

Example: Configuring a Reachable, Stale, and Down Lifetime at the Global vs Policy Level

The following example shows you how to configure the reachable, stale, and down lifetimes for binding entries, at a global level. This example also shows you how you can then override the global setting and

configure a different lifetime for entries learnt on a particular interface or VLAN, by configuring a policy-level setting.

In the first part of the example, the output of the **show device-tracking policy *policy-name*** command shows that a policy-level value is not set and the default binding table settings are applicable to the existing entries. After a reachable, stale, and down lifetime is configured with the **device-tracking binding** command in global configuration mode, the new values are effective and are applied only to the four new entries that are added to the table.

Note In the output of the **show device-tracking database** command, note the `Time left` column for the binding entries. There is minor difference in the reachable lifetime of each entry. This is a system-imposed jitter (+/- 5 percent of the configured value), to ensure that system performance is not affected when a large number of entries are added to the binding table. Binding entries go through their lifecycle in a staggered manner thus preventing points of congestion.

Current configuration, which shows that policy-level reachable lifetime is not configured. The binding table entries show that the current reachable lifetime is 500 seconds (time left + age):

```
Device# show device-tracking policy sisf-01
Device-tracking policy sisf-01 configuration:
  security-level guard
  device-role node
  gleaning from Neighbor Discovery
  gleaning from DHCP6
  gleaning from ARP
  gleaning from DHCP4
  NOT gleaning from protocol unkn
Policy sisf-01 is applied on the following targets:
Target          Type Policy          Feature          Target range
Tel/0/4         PORT  sisf-01         Device-tracking  vlan 200

Device# show device-tracking database
Binding Table has 4 entries, 4 dynamic (limit 200000)
Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol,
DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created
Preflevel flags (prlvl):

In this second part of the example, a policy level value is configured and the reachable lifetime is set to 50 seconds. This new reachable lifetime is again applicable only to entries created after this.

Only a reachable lifetime is configured at the policy-level and not a stale and down lifetime. This means it is still the global values that apply if the reachable lifetime of the two new entries expires and they move to the STALE or DOWN state.

```

Device(config)# device-tracking policy sif-01
Device(config-device-tracking)# tracking enable reachable-lifetime 50
Device# show device-tracking policy sif-01
Device-tracking policy sif-01 configuration:
  security-level guard
  device-role node
  gleaning from Neighbor Discovery

Example: Creating a Static Binding Entry

The following example shows you how to create a static binding entry. The "S" at the beginning of the entry indicates that it is a static binding entry:

```

Device(config)# device-tracking binding vlan 100 192.0.2.1 interface tengigabitethernet1/0/1
00:00:5e:00:53:af reachable-lifetime infinite
Device(config)# exit
Device# show device-tracking database
Binding Table has 2 entries, 0 dynamic (limit 200000)
Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol,
DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created
Preflevel flags (prlvl):
0001:MAC and LLA match      0002:Orig trunk      0004:Orig access
0008:Orig trusted trunk     0010:Orig trusted access  0020:DHCP assigned

```

```
0040:Cga authenticated      0080:Cert authenticated    0100:Statically assigned
```

| | Network Layer Address | | Link Layer Address | Interface | vlan |
|-------|-----------------------|-----------|--------------------|-----------|------|
| prlvl | age | state | Time left | | |
| S | 192.0.2.1 | | 0000.5e00.53af | Te1/0/1 | 100 |
| 0100 | 14s | REACHABLE | N/A | | |

Example: Global vs Policy-Level Address Limits

The following example show you how to assess which address limit is reached, when you configure address limits at the global level and at the policy-level.

The global level settings refer to the values configured for the following command string: **device-tracking binding max-entries no_of_entries [mac-limit no_of_entries | port-limit no_of_entries | vlan-limit no_of_entries]**

The policy level parameter refers to the **limit address-count** option in the device-tracking configuration mode.

For this first part of the example, the configuration is as follows:

- Global configuration: max-entries=30, vlan-limit=25, port-limit=20, mac-limit=19.
- Policy-level configuration: limit address-count=45.

The output of the **show device-tracking database details** privileged EXEC command shows that the port limit (`max/port`) is reached first. A maximum of 20 entries are allowed on a port or interface. No further binding entries are created after this. While the mac limit is configured with a lower absolute value (19), the output of the **show device-tracking database mac** privileged EXEC command shows that there are only 3 unique MAC address in the list of binding entries in the table - this limit is therefore not reached.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# device-tracking binding max-entries 30 vlan-limit 25 port-limit 20 mac-limit
19
Device(config)# device-tracking policy sisf-01
Device(config-device-tracking)# limit address-count 45
Device(config-device-tracking)# end
Device# show device-tracking policy sisf-01
Device-tracking policy sisf-01 configuration:
  security-level guard
  device-role node
  gleaning from Neighbor Discovery
  gleaning from DHCP6
  gleaning from ARP
  gleaning from DHCP4
  NOT gleaning from protocol unkn
  limit address-count 45
Policy sisf-01 is applied on the following targets:
Target          Type Policy          Feature          Target range
Tel/0/4         PORT sisf-01         Device-tracking Device-tracking
vlan 200

Device# **show device-tracking database mac**

| MAC | Interface | vlan | prlvl | state | Time left |
|-----|-----------|------|-------|-------|-----------|
|-----|-----------|------|-------|-------|-----------|

```

Policy          Input_index
000c.959d.6816 Tel/0/4      200          NO TRUST    MAC-REACHABLE  27 s
sisf-01         12
000b.959d.6816 Tel/0/4      200          NO TRUST    MAC-REACHABLE  27 s
sisf-01         12
000a.959d.6816 Tel/0/4      200          NO TRUST    MAC-REACHABLE  27 s
sisf-01         12

```

For this second part of the example, the configuration is as follows:

- Global configuration: max-entries=30, vlan-limit=25, port-limit=20, mac-limit=19.
- Policy-level configuration: limit address-count=14.

The limit that is reached first is the policy-level, **limit address-count**. A maximum of 14 IP addresses (IPv4 and IPv6) are allowed on the port or interface where policy "sisf-01" is applied. No further binding entries are created after this. While the mac limit is configured with a lower absolute value (19), there are only 3 unique MAC address in the list of binding entries in the table - this limit is therefore not reached.

```

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# device-tracking policy sisf-01
Device(config-device-tracking)# limit address-count 14
Device(config-device-tracking)# end
Device# show device-tracking policy sisf-01
Device-tracking policy sisf-01 configuration:
  security-level guard
  device-role node
  gleaning from Neighbor Discovery
  gleaning from DHCP6
  gleaning from ARP
  gleaning from DHCP4
  NOT gleaning from protocol unkn
  limit address-count 14
Policy sisf-01 is applied on the following targets:
Target      Type  Policy      Feature      Target range
Tel/0/4     PORT  sisf-01     Device-tracking vlan 200

```

After the stale lifetime of all the existing entries has expired and the entries have been removed from the binding table, new entries are added according to the reconfigured values:

```

Device# show device-tracking database <<<<checking time left for stale-lifetime to expire
for existing entries.
Binding Table has 20 entries, 20 dynamic (limit 30)

Example: Setting VLAN, Port, and MAC Limits to Default Values

The following example shows you how to reset one or more limits to their default values.

```
Device(config)# device-tracking binding max-entries 30 vlan-limit 25 port-limit 20 mac-limit
19 <<<< all three limits configured.
```

```
Device(config)#exit
```

```
Device# show device-tracking database details
```

```
Binding table configuration:
```

```
-----
```

```
max/box   : 30
max/vlan  : 25
max/port  : 20
max/mac   : 19
```

```
<output truncated>
```

```
Device# configure terminal
```

```
Device(config)# device-tracking binding max-entries 30 vlan-limit 25 <<<< only VLAN limit
configured; port-limit and mac-limit keywords leftout.
```

```
Device(config)# exit
```

```
Device# show device-tracking database details
```

```
Binding table configuration:
```

```
-----
```

```

max/box : 30
max/vlan : 25
max/port : no limit    <<<reset to default
max/mac : no limit    <<<reset to default

```

Example: Global vs Policy-Level Limits Relating to MAC Addresses

The following example shows how precedence is determined for global and policy-level MAC limits. The global value specifies the maximum number of entries allowed per MAC address. The policy-level IPv4 per MAC and IPv6 per MAC limits, which may be present only in a programmatic policy, specify the number of IPv4 and IPv6 addresses allowed per MAC address.

In the first part of the example, the global value (10 entries allowed per MAC address) is higher than the policy-level setting (3 IPv4 addresses allowed for each MAC address). The `Binding` table current counters, in the output of the **show device-tracking database details** privileged EXEC command shows that and the limit that is reached first is the policy level limit.

Note No configuration is displayed for the policy-level setting, because you cannot *configure* the "IPv4 per mac" or the "IPv6 per mac" in any policy. In this example, the DT-PROGRAMMATIC policy is applied to target by configuring the **ip dhcp snooping vlan** *vlan* command in global configuration mode. The IPv4 per mac limit exists, because the programmatically created policy has a limit for this parameter.

```

Device# configure terminal
Device(config)# ip dhcp snooping vlan 200
Device(config)# end
Device# show device-tracking policy DT-PROGRAMMATIC
Policy DT-PROGRAMMATIC configuration:
  security-level glean (*)
  device-role node
  gleaning from Neighbor Discovery
  gleaning from DHCP
  gleaning from ARP
  gleaning from DHCP4
  NOT gleaning from protocol unkn
  limit address-count for IPv4 per mac 3 (*)
  tracking enable
Policy DT-PROGRAMMATIC is applied on the following targets:
Target   Type   Policy           Feature           Target range
Tel/0/4  PORT  DT-PROGRAMMATIC  Device-tracking  vlan 200

note:
Binding entry Down timer: 24 hours (*)
Binding entry Stale timer: 24 hours (*)

Device(config)# device-tracking binding max-entries 50 mac-limit 10
Device# show device-tracking database details
Binding table configuration:
-----
max/box : 50
max/vlan : no limit
max/port : no limit
max/mac : 10

Binding table current counters:
-----
dynamic : 3
local   : 0
total   : 3

```

```
Binding table counters by state:
```

```
-----
REACHABLE : 2
total     : 3
```

```
Device# show device-tracking database
```

```
Binding Table has 3 entries, 3 dynamic (limit 50)
```

```
Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol,
DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created
```

```
Preflevel flags (prlvl):
```

```

device-tracking logging

To log snooping security events like packet drops, unresolved packets, and suspected MAC or IP theft, configure the **device-tracking logging** command in global configuration mode. To disable logging, enter the **no** form of the command.

device-tracking logging [**packet drop** | **resolution-veto** | **theft**]

no device-tracking logging [**packet drop** | **resolution-veto** | **theft**]

| Syntax Description | | |
|--------------------|------------------------|--------------------------------|
| | packet drop | Logs packet drop events. |
| | resolution-veto | Logs unresolved packet events. |
| | theft | Logs IP and MAC theft events. |

Command Default Events are not logged.

Command Modes Global configuration [Device(config)#]

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Logs generated for snooping security events have a severity level of 4 (meaning, warnings). For example:

```
%SISF-4-PAK_DROP: Message dropped A=FE80::20D:FF:FE0E:F G=- V=10 I=Tu0 P=NDP::RA Reason=Packet not authorized on port
```

You can view snooping security logs by entering the **show logging | include SISF-4** command in privileged EXEC mode.

For information about the snooping events for which logs are generated, see the system message guide for the corresponding release: [System Message Guides](#). Search for `SISF-4`.

Packet Drop Events

When you configure the **packet drop** keyword, a log is generated everytime a packet is dropped. The log also includes the reason for the packet drop. The reasons include and are not limited to the following:

- `Packet not authorized on port`: This means that a security feature dropped the packet because a packet of this kind is not expected on the port, based on the configuration. Examples of such security features and the situations in which a packet is dropped, include and are not limited to the following: The Router Advertisement Guard feature may decide to drop IPv6 Router Advertisement packets if they are received on ports that are not configured as router-facing ports. The DHCP Guard feature may drop packets from DHCP server (DHCP OFFER or DHCP REPLY) if they are received on a port which is not configured as server-facing port.
- `Packet accepted but not forwarded`: This means that the packet is not forwarded, but it is still considered valid to glean binding information from. This is usually seen when packets from a host are seen by SISF during the validation phase (while the binding is in a transitional state).

- **Malformed Packet dropped in Guard mode:** This means that the incoming packet is malformed and cannot be parsed properly.
- **Packet is throttled:** This means the packet was dropped because it exceeds the throttling limit for packets within a time interval. The system allows a maximum of 50 packets in 5 seconds.
- **Silent drop:** This happens to packets that are generated either by device-tracking instances to communicate among the different instances across multiple switches, or as a response to an action triggered by device-tracking. For instance, a response on the probe that was initiated by the device-tracking, to determine the reachability status of the host reachability.
- **Martian packet:** This means that the incoming packet was dropped because it has Martian source IP address, such as, a multicast, loopback, or unspecified address.
- **Martian mac:** This means that the incoming packet was dropped because it has a Martian MAC or Link-Layer source address.
- **Address limit per box reached:** This means that the incoming packet was dropped, because the limit configured with the **device-tracking binding max-entries no_of_entries** global configuration command, was reached. Enter the **show device-tracking database details** privileged EXEC command to display current limits.
- **Address limit per vlan reached:** This means that the incoming packet was dropped, because the limit configured with the **device-tracking binding max-entries no_of_entries vlan-limit no_of_entries** global configuration command, was reached. Enter the **show device-tracking database details** privileged EXEC command to display current limits.
- **Address limit per port reached:** This means that the incoming packet was dropped, because the limit configured with the **device-tracking binding max-entries no_of_entries port-limit no_of_entries** global configuration command, was reached. Enter the **show device-tracking database details** privileged EXEC command to display current limits.
- **Address limit per policy reached :** This means that the incoming packet was dropped, because the limit configured with the **limit address-count ip-per-port** keyword in the device-tracking configuration mode was reached. This is configured at a policy level. Enter the **show device-tracking policy policy-name** privileged EXEC command to display current limits.
- **Address limit per mac reached:** This means that the incoming packet was dropped, because the limit configured with the **device-tracking binding max-entries no_of_entries mac-limit no_of_entries** global configuration command, was reached. Enter the **show device-tracking database details** privileged EXEC command to display current limits.
- **Address Family limit per mac reached:** This means that the incoming packet was dropped, because the IPv4 per MAC or IPv6 per MAC limit specified in a programmatic policy was reached. You cannot configure this policy parameter; a programmatically created policy may have either an IPv4 per MAC limit, or an IPv6 per MAC limit, or both, or neither. Enter the **show device-tracking policy policy-name** privileged EXEC command to display the limit if it exists.

Resolution Veto Events

When you configure the **resolution-veto** keyword, a log is generated for every unresolved packet. This logging option meant to be used only if the IPv6 Destination Guard feature is also enabled.

The IPv6 Destination Guard feature ensures that the device performs address resolution only for those addresses that are known to be active on the link. All destinations that are active on the link are entered in the binding

table. When a destination is not found in the binding table, address resolution is prevented. By configuring **resolution-veto** logging you can keep track of such unresolved packets.

If the **resolution-veto** keyword is configured and the IPv6 Destination Guard feature is not, logs are not generated.

Theft Events

When you configure the **theft** keyword, a log is generated when SISF detects an IP theft, or a MAC theft or both.

In the log, verified binding information (IP, MAC address, interface or VLAN) is preceded by the term "Known". A suspicious IP address and MAC address is preceded by the term "New" or "Cand". Interface and VLAN information is also provided along with the suspicious IP or MAC address - this helps you identify where the suspicious traffic was seen.

For example, see the following MAC theft log:

```
%SISF-4-MAC_THEFT: MAC Theft Cand IP=2001::12B VLAN=70 MAC=9cfc.e85e.139d Cand I/F=Gil/0/4
Known IP=71.0.0.96 Known I/F=Ac0
```

These snippets of the log show the IP address of the suspicious host and the interface on which it was seen: Cand IP=2001::12B, VLAN=70, Cand I/F=Gil/0/4.

This snippet of the log shows the *known* MAC address, which the suspicious host is using:

```
MAC=9cfc.e85e.139d.
```

These snippets of the log show the IP address and interface of the existing, verified entry: Known IP=71.0.0.96 and Known I/F=Ac0.

Examples

- [Example: Packet Drop Logs, on page 1783](#)
- [Example: Theft Logs, on page 1783](#)

Example: Packet Drop Logs

The following are examples of logs generated for packet drop events:

```
%SISF-4-PAK_DROP: Message dropped A=FE80::20D:FF:FE0E:F G=- V=10 I=Tu0 P=NDP::RA Reason=Packet
not authorized on port
```

```
%SISF-4-PAK_DROP: Message dropped A=20.0.0.1 M=dead.beef.0001 V=20 I=Gil/0/23 P=ARP
Reason=Packet accepted but not forwarded
```

Example: Theft Logs

The following are examples of logs generated for IP and MAC theft events:

```
%SISF-4-MAC_AND_IP_THEFT: MAC_AND_IP Theft A=FE80::EE1D:8BFF:FE9B:102 V=102 I=Vl102
M=ec1d.8b9b.0102 New=Tu0
```

```
%SISF-4-MAC_THEFT: MAC Theft IP=192.2.1.2 VLAN=102 MAC=cafe.cafe.cafe I/F=Gil/0/3 New I/F
over fabric
```

```
%SISF-4-IP_THEFT: IP Theft IP=FE80::9873:1D5E:E6E9:1F7E VLAN=20 MAC=2079.18d5.13ad IF=Ac0
New I/F over fabric
```

```
%SISF-4-IP_THEFT: IP Theft IP=10.0.187.5 VLAN=10 Cand-MAC=0069.0000.0001 Cand-I/F=Gi1/0/23  
Known MAC over-fabric Known I/F over-fabric
```

```
%SISF-4-MAC_THEFT: MAC Theft Cand IP=2001::12B VLAN=70 MAC=9cfc.e85e.139d Cand I/F=Gi1/0/4  
Known IP=71.0.0.96 Known I/F=Ac0
```

device-tracking policy

To create a custom device-tracking policy, and to enter the device-tracking configuration mode to configure the various parameter of the policy, enter the **device-tracking policy** command in global configuration mode. To delete a device tracking policy, use the **no** form of this command.

device-tracking policy *policy-name*
no device-tracking policy *policy-name*

Syntax Description

policy-name Creates a device-tracking policy with the specified name - if it doesn't already exist. You can also specify the name of a programmatically created policy.

After you configure a policy name, the device enters the device-tracking configuration mode, where you can configure policy parameters. Enter a question mark (?) at the system prompt to see the list of policy parameters that can be configured.

Command Default

SISF-based device tracking is disabled.

Command Modes

Global configuration [Device(config)#]

Command History

| Release | Modification |
|-----------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Fuji 16.9.1 | The option to change the parameters of <i>any</i> programmatic policy was deprecated. |

Usage Guidelines

When you enter the **device-tracking policy***policy-name* command in global configuration mode, the system creates a custom policy with the specified name (if it does not already exist) and enters the device-tracking configuration mode. In this mode, you can configure policy parameters.

After you create a policy and configure its parameters, you must attach it to an interface or VLAN. Only then does the activity of extracting binding information (IP and MAC address) from packets that enter the network and the creation of binding entries, actually begin. For more information about attaching a policy, see [device-tracking \(interface config\)](#), on page 1755 [device-tracking \(VLAN config\)](#), on page 1758.

To display detailed information about all the policies available on the device and the targets they are attached to, enter the **show device-tracking policies detail** command in privileged EXEC mode.

Configuring Policy Parameters

You can configure the parameters of a policy only if it is a custom policy. You cannot change the parameters of a programmatic policy. You also cannot change the parameters of the `default` policy.

To display the list of parameters for a policy, enter a question mark (?) at the system prompt in device-tracking configuration mode:

```
Device(config)# device-tracking policy sisf-01
Device(config-device-tracking)# ?
device-tracking policy configuration mode:
  data-glean          binding recovery by data traffic source address
                    gleaning
  default             Set a command to its defaults
  destination-glean  binding recovery by data traffic destination address
```

| | |
|----------------------|---|
| | gleaning |
| device-role | Sets the role of the device attached to the port |
| distribution-switch | Distribution switch to sync with |
| exit | Exit from device-tracking policy configuration mode |
| limit | Specifies a limit |
| medium-type-wireless | Force medium type to wireless |
| no | Negate a command or set its defaults |
| prefix-glean | Glean prefixes in RA and DHCP-PD traffic |
| protocol | Sets the protocol to glean (default all) |
| security-level | setup security level |
| tracking | Override default tracking behavior |
| trusted-port | setup trusted port |
| vpc | setup vpc port |

| Keyword | Description |
|-------------------|---|
| data-glean | <p>Enables learning of addresses from a data packet snooped from a source inside the network and populates the binding table with the data traffic source address. Enter one of these options:</p> <ul style="list-style-type: none"> • log-only: Generates a syslog message upon data packet notification. • recovery: Uses a protocol to enable binding table recovery. Enter NDP or DHCP. |
| default | <p>Sets the policy parameter to its default value. You can set these policy attributes to their default values:</p> <ul style="list-style-type: none"> • data-glean: Source address is not learnt or gleaned. • destination-glean: Destination address is not learnt or gleaned • device-role: Node. • distribution-switch: Not supported. • limit: An address count limit is not set. • medium-type-wireless: <tb> • prefix-glean: Prefixes are not learnt. • protocol: Addresses of all protocols (ARP, DHCP4, DHCP6, NDP, and UDP) are gleaned. • security-level: Guard. • tracking: Polling is disabled. • trusted-port: Disabled, that is, the guard function is enabled on the configured target) • vpc: Not supported. |

| Keyword | Description |
|-----------------------------|--|
| destination-glean | <p>Enables population of the binding table by gleaning the destination address of data traffic. Enter one of these options:</p> <ul style="list-style-type: none"> • log-only: Generates a syslog message upon data packet notification. • recovery: Uses a protocol to enable binding table recovery. Enter NDP or DHCP. |
| device-role | <p>Indicates the type of device that is facing the port and this can be one of the following:</p> <ul style="list-style-type: none"> • node: Allows creation of binding entries for a port. • switch: Stops the creation of binding entries for a port. This option is suited to multi-switch set-ups, where the possibility of large device tracking tables is very high. Here, a port facing a device (an uplink trunk port) can be configured to stop creating binding entries, and the traffic arriving at such a port can be trusted, because the switch on the other side of the trunk port will have device tracking enabled and that will have checked the validity of the binding entry. <p>This option is commonly used along with the trusted-port keyword. Configuring both the device-role and trusted-port options on an uplink trunk port helps build an efficient and scalable “secure zone”. Both parameters must be configured to achieve an efficient distribution of the creation of binding table entries (thus keeping the binding tables smaller).</p> |
| distribution-switch | Although visible on the CLI, this keyword is not supported. Any configuration does not take effect. |
| exit | Exits the device-tracking configuration mode and returns to global configuration mode. |
| limit address-count | <p>Configures the maximum number of number of IPv4 and IPv6 addresses to be allowed per port. The purpose of this limit is to ensure that binding entries are restricted to only known and expected hosts.</p> <p><i>ip-per-port</i>: Enter the maximum number of IP addresses you want to allow on a port. This limit applies to IPv4 and IPv6 addresses as a whole. When the limit is reached, no further IP addresses can be added to the binding table, and traffic from new hosts are dropped.</p> <p>Enter a value between 1 and 32000.</p> |
| medium-type-wireless | Although visible on the CLI, this keyword is not supported. Any configuration does not take effect. |

| Keyword | Description |
|--------------------------|---|
| no | <p>Negates the command, that is, reverts a policy parameter to its default value.</p> <p>For information about what the default value is, see the default keyword.</p> <ul style="list-style-type: none"> • data-glean • destination-glean • device-role • distribution-switch: Not supported. • limit address-count • medium-type-wireless • prefix-glean • protocol • security-level • tracking • trusted-port • vpc: Not supported. |
| prefix-glean only | <p>Enables learning of prefixes from either IPv6 Router Advertisements or from DHCP-PD. You have the following option:</p> <p>(Optional) only: Gleans only prefixes and not host addresses.</p> |
| protocol | <p>Gleans addresses of specified protocols. By default, all are gleaned. Enter one of these options:</p> <ul style="list-style-type: none"> • arp [prefix-list name]: Gleans addresses in ARP packets. Optionally, enter the name of prefix-list that is to be matched. • dhcp4 [prefix-list name]: Gleans addresses in DHCPv4 packets. Optionally, enter the name of prefix-list that is to be matched. • dhcp6 [prefix-list name]: Gleans addresses in DHCPv6 packets. Optionally, enter the name of prefix-list that is to be matched. • ndp [prefix-list name]: Gleans addresses in NDP packets. Optionally, enter the name of prefix-list that is to be matched. • udp [prefix-list name]: Although visible on the CLI, this option is not supported. Any configuration does not take effect. |

| Keyword | Description |
|-----------------------|--|
| security-level | <p>Specifies the level of security that is enforced. When a packet enters the network, SISF extracts the IP and MAC address (the source of the packet) and subsequent action, is dictated by the security level configured in the policy.</p> <p>Enter one of these options:</p> <ul style="list-style-type: none">• glean: Extracts the IP and MAC address and enters them into the binding table, without any verification. Use this option if you want to only <i>learn</i> about the host and not rely on SISF for authentication of the binding entry.• guard: Extracts the IP and MAC address and checks this information against the binding table. The outcome of the verification determines if a binding entry is added, or updated, or if the packet is dropped and the client is rejected <p>This is the default value for the security-level parameter.</p> <ul style="list-style-type: none">• inspect: Although this keyword is available on the CLI, we recommend not using it. The glean and guard options described above address most use cases and network requirements. |

| Keyword | Description |
|---------------------|--|
| tracking | <p>Determines if an entry is polled after the reachable lifetime expires. Polling is a periodic and conditional checking of the host to see the state it is in, whether it is still connected, and whether it is communicating. For more information about polling, see the <i>Usage Guidelines</i> below.</p> <p>By default, polling is not enabled.</p> <p>Enter one of these options:</p> <ul style="list-style-type: none"> • disable : Turns off polling action. <p>[stale-lifetime {<i>seconds</i> infinite}]: Optionally you can also configure a stale-lifetime. If you do, configure one of the following for the stale-lifetime timer:</p> <ul style="list-style-type: none"> • <i>seconds</i>: Configure a value for the stale-lifetime timer. Enter a value between 1 and 86400 seconds. The default value is 86400 seconds (24 hours). • infinite: Disables the timer for the STALE state. This means that a timer is not started when an entry enters the STALE state and the entry remains in the STALE state, indefinitely. <ul style="list-style-type: none"> • enable: Turns on polling action. <p>[reachable-lifetime [<i>seconds</i> infinite]]: Optionally you can also configure a reachable-lifetime. If you do, configure one of the following for the reachable-lifetime timer:</p> <ul style="list-style-type: none"> • <i>seconds</i>: Configure a value for the reachable-lifetime timer. Enter a value between 1 and 86400 seconds. The default value is 300 seconds (5 minutes). • infinite: Disables the timer for the REACHABLE state. This means that a timer is not started when an entry enters the REACHABLE state and the entry remains in the REACHABLE state, indefinitely. |
| trusted-port | <p>This option disables the guard function on configured targets. Bindings learned through a trusted-port have preference over bindings learned through any other port. A trusted port is also given preference in case of a collision while making an entry in the table.</p> <p>This option is commonly used along with the device-role keyword. Configuring both the device-role and trusted-port options on an uplink trunk port helps achieve an efficient distribution of the creation of binding table entries (thus keeping the binding tables smaller).</p> |
| vpc | <p>Although visible on the CLI, this option is not supported. Any configuration does not take effect.</p> |

Global versus Policy-Level Settings

You configure policy parameters in the device-tracking configuration mode and what you configure for a policy applies only to that policy. Some of the policy parameters have counterparts in the global configuration mode. For detailed information about the parameters that have global-level counterparts and to know which value takes precedence (whether the globally configured or the policy-level value), see: [device-tracking binding, on page 1761](#).

Polling a Host

If you configure the **tracking** policy parameter, the switch sends a polling request after the reachable lifetime expires. The switch polls the host up to 3 times at fixed, system-determined intervals. You can also specify an interval by using the **device-tracking tracking retry-interval** *seconds* command in global configuration mode. The polling request is in the form of an Address Resolution Protocol (ARP) probe or a Neighbor Solicitation message. During this time the state of the entry changes to VERIFY.

If a polling response is received (thus confirming reachability of the host), the state of the entry changes back to REACHABLE. If the switch does not receive a polling response after 3 attempts, the entry changes to the STALE state.

Note Using the **tracking** policy parameter, you can enable or disable polling at a policy-level regardless of whether the polling is enabled or disabled at the global configuration level (the **device-tracking tracking** command in global configuration mode. See [Example: Disabling Polling at a Policy-Level, on page 1792](#) and [device-tracking tracking, on page 1798](#).

Changing the Limit Address-Count

If you configure a limit using the **limit address-count** policy parameter and then change it - the new limit is applicable only to entries learned after the change. Further, regardless of whether the new limit is higher or lower than the previous limit, existing entries are not affected and are allowed to go through their binding entry lifecycle.

If the binding table is full (in accordance with the previous limit), any new entries are not added until the existing entries complete their lifecycle. SISF attempts to create space for new entries by identifying and removing only *inactive* entries. But if the entries are active, they are not removed and are allowed to go through their binding entry lifecycle.

If you want to make the new lower limit take effect immediately, you can use either one of these options:

- Enter the **clear device-tracking database** command in privileged EXEC mode and specify an interface or VLAN. This removes all existing entries from the database of only the specified target. New entries are then learned and added as per the current limit address-count settings. See [Example: Changing the Address Count Limit, on page 1792](#).
- Remove and reattach the policy on the required target. Enter the **no device-tracking policy** *policy-name* command in interface or VLAN configuration mode to remove the policy. Removing the policy from an interface or VLAN removes the bindings that are attached to the target. Enter the **device-tracking policy** *policy-name* command in interface or VLAN configuration mode to reattach it. Reattaching the policy causes learning of all the binding entries according to the new limit.

Examples

- [Example: Disabling Polling at a Policy-Level, on page 1792](#)
- [Example: Changing the Address Count Limit, on page 1792](#)

Example: Disabling Polling at a Policy-Level

The following example shows how you can disable polling at the policy-level even if polling is enabled at the global level. Here, polling is disabled for all interfaces and VLANs where policy `sisf-01` is applied.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# device-tracking tracking
Device(config)# exit
Device# show running-config | include device-tracking device-tracking tracking
device-tracking policy sif-01
  device-tracking attach-policy sif-01
  device-tracking attach-policy sif-01 vlan 200
device-tracking binding reachable-lifetime 700 stale-lifetime 1000 down-lifetime 200
device-tracking binding logging
```

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# device-tracking policy sif-01
Device(config-device-tracking)# tracking disable
Device(config-device-tracking)# end
Device# show device-tracking policy sif-01
Device-tracking policy sif-01 configuration:
  security-level guard
  device-role node
  gleaning from Neighbor Discovery
  gleaning from DHCP6
  gleaning from ARP
  gleaning from DHCP4
  NOT gleaning from protocol unkn
  limit address-count 5
  tracking disable
Policy sif-01 is applied on the following targets:
Target          Type Policy          Feature          Target range
Tel1/0/4        PORT  sif-01           Device-tracking  vlan 200
vlan 200         VLAN  sif-01           Device-tracking  vlan all
```

Example: Changing the Address Count Limit

The following example shows you how to make a change in the **limit address-count** policy parameter setting take effect immediately. In this example, the `clear` command is used to remove all entries from the binding table for the changed settings to take effect immediately.

```
Device# show device-tracking policy sif-01
Device-tracking policy sif-01 configuration:
  security-level guard
  device-role node
  gleaning from Neighbor Discovery
  gleaning from DHCP6
  gleaning from ARP
  gleaning from DHCP4
  NOT gleaning from protocol unkn
  limit address-count 25
Policy sif-01 is applied on the following targets:
Target          Type Policy          Feature          Target range
Tel1/0/4        PORT  sif-01           Device-tracking  vlan 200
vlan 200         VLAN  sif-01           Device-tracking  vlan all

Device# show running-config | include device-tracking
```

```

device-tracking policy sisf-01
  device-tracking attach-policy sisf-01
  device-tracking attach-policy sisf-01 vlan 200
device-tracking binding reachable-lifetime 700 stale-lifetime 1000 down-lifetime 200
device-tracking binding logging

The address count limit is changed from 25 to a lower limit of 5. But because the existing entries have not completed their binding entry lifecycle, they are not deleted from the binding table. In order to make the new address count limit of 5 take effect immediately, the **clear device-tracking database** command is used to delete all existing entries. New entries are then learned and added as per the current limit address-count settings.

```

Device# configure terminal
Device(config)# device-tracking policy sif-01
Device(config-device-tracking)# limit address-count 5
Device(config-device-tracking)# end
Device# show device-tracking policy sif-01

```

Device-tracking policy sif-01 configuration:

```

security-level guard
device-role node
gleaning from Neighbor Discovery
gleaning from DHCP6
gleaning from ARP
gleaning from DHCP4
NOT gleaning from protocol unkn
limit address-count 5

```

Policy sif-01 is applied on the following targets:

| Target | Type | Policy | Feature | Target range |
|----------|------|--------|-----------------|--------------|
| Tel/0/4 | PORT | sif-01 | Device-tracking | vlan 200 |
| vlan 200 | VLAN | sif-01 | Device-tracking | vlan all |

```

Device# show device-tracking database

```

Binding Table has 25 entries, 25 dynamic (limit 200000)

Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol, DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created

device-tracking tracking

To enable polling for IPv4 and IPv6 and configure the polling parameters, configure the **device-tracking tracking** command in global configuration mode. To disable polling, enter the **no** form of the command.

Note This command does not enable the SISF-based device-tracking feature. It enables configuration of polling parameters on a device where the device-tracking feature is enabled.

device-tracking tracking [**auto-source** [**fallback** *ipv4_and_fallback_source_mask ip_prefix_mask* [**override**]] | **retry-interval** *seconds*]

no device-tracking tracking [**auto-source** | **retry-interval**]

Syntax Description

auto-source

Causes the source address of an Address Resolution Protocol (ARP) probe to be sourced in the following order of preference:

- The first preference is to set the source address to the VLAN SVI, if an SVI is configured.
- The second preference is to locate an IP-MAC binding entry in device-tracking table, from same subnet and use that as the source address.
- The third and last preference is to use 0.0.0.0 as the source address.

fallback

ipv4_and_fallback_source_mask ip_prefix_mask

Causes the source address of an ARP probe to be sourced in the following order of preference:

- The first preference is to set the source address to the VLAN SVI, if an SVI is configured.
- The second preference is to locate an IP-MAC binding entry in device-tracking table, from same subnet and use that as the source address.
- The third and last preference is to compute the source address from the client's IPv4 address and the mask provided.

The source MAC address is taken from the MAC address of the switchport facing the client.

If you configure the **fallback** keyword, you must also specify an IP address and mask.

| | |
|-----------------|--|
| override | <p>Causes the source address of an ARP probe to be sourced in the following order of preference:</p> <ul style="list-style-type: none"> • The first preference is to set the source address to the VLAN SVI, if this is configured. • The second and last preference is to use 0.0.0.0 as the source address. <p>Note This keyword configures SISF to <i>not</i> select the source address from the binding table. We do not recommend using this option if an SVI is not configured.</p> |
|-----------------|--|

| | |
|--------------------------------------|---|
| retry-interval <i>seconds</i> | <p>Configures a multiplicative factor or "base value", for the backoff algorithm. The backoff algorithm determines the wait time between the 3 polling attempts that occur after reachable lifetime expiry.</p> <p>Enter a value between 1 and 3600 seconds. The default value is one.</p> <p>When polling, there is an increasing wait time between the 3 polling attempts or retries. The backoff algorithm determines this wait time. The value you configure for the retry interval is multiplied by the backoff algorithm's wait time.</p> <p>For example, if the backoff algorithm determines a wait time of 2, 4, and 6 seconds between the 3 attempts respectively, and you configure a retry interval of 2 seconds, the actual interval you will observe is as follows: 2*2 seconds of wait time before the first polling attempt, 2*4 seconds for the second polling attempt and 2*6 for the third polling attempt.</p> <p>If polling is enabled, but a retry interval is not configured, the switch polls the host up to 3 times at system-determined intervals.</p> <p>This configuration applies to ARP probes and Neighbor Solicitation messages.</p> |
|--------------------------------------|---|

| | |
|------------------------|---------------------------------|
| Command Default | Polling is disabled by default. |
|------------------------|---------------------------------|

|-----------------------------|--|---------|--------------|-----------------------------|------------------------------|
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines

Polling is a periodic and conditional checking of the host to see the state it is in, whether it is still connected, and whether it is communicating. Polling enables you to assess the continued presence of a tracked device.

Polling occurs at these junctures: 3 times after the reachable lifetime timer expires, and a final attempt at stale lifetime expiry.

- In an IPv4 network, polling is in the form of an ARP probe. Here, the switch sends unicast ARP probes to the connected host, to determine the host's reachability status. When sending ARP probes, the system constructs packets according to [RFC 5227](#) specifications.
- In an IPv6 network, polling is in the form of a Neighbor Solicitation message. Here, the switch verifies reachability of a connected host by using the unicast address of the connected host as the destination address.

Configure the **device-tracking tracking** command in global configuration mode, to enable polling for IPv4 and IPv6.

Also configure the **retry-interval** *seconds* to configure the polling interval after reachable lifetime timer expiry.

Note The **auto-source**, **fallback** *ipv4_and_fallback_source_maskip_prefix_mask*, and **override** keywords apply only to ARP probes and not Neighbor Solicitation messages.

The value you configure for **retry-interval** *seconds* keywords applies to both IPv4 and IPv6.

Enter the **show running-config | include device-tracking** display current polling settings. For example:

```
Device# show running-config | include device-tracking
device-tracking tracking retry-interval 2
device-tracking policy sif-01
  device-tracking attach-policy sif-01 vlan 200
device-tracking binding reachable-lifetime 50 stale-lifetime 150 down-lifetime 30
device-tracking binding logging
```

Enter the **show device-tracking database** command in privileged EXEC mode, to display the duration of the various lifetimes of an entry. While polling, the system changes the state of the entry to VERIFY. Check the `Time left` column in the output to observe the duration.

When you track the reachable and stale lifetime of an entry with the **show device-tracking database** command, and polling is enabled, you may notice that the STALE lifetime is sometimes shorter than what you have configured. This is because the time required for polling is *subtracted* from the stale lifetime.

Global versus Policy-Level Settings for Polling

After you configure **device-tracking tracking** command in global configuration mode, you still have the flexibility to turn polling on or off, for individual interfaces and VLANs. For this you must enable or disable polling in the policy. Note how the global and policy-level settings interact:

| Global Setting | Policy-Level Setting | Result |
|--|---|---|
| Polling is enabled at the global level. Device(config)# device-tracking tracking | Polling is enabled on an interface or VLAN. Device(config-device-tracking)# tracking enable | Polling is effective on the interface or VLAN. |
| | Polling is disabled on an interface or VLAN. Device(config-device-tracking)# tracking disable | Polling is not effective on the interface or VLAN. |
| | Default polling is configured on the interface or VLAN. Device(config-device-tracking)# default tracking | Because polling is enabled at the <i>global</i> config level, polling is effective on the interface or VLAN. |
| | The no form of the command is configured on the interface or VLAN. Device(config-device-tracking)# no tracking | The no form of the command sets the command to its default. But because polling is enabled at the <i>global</i> config level, polling is effective on the interface or VLAN. |
| Polling is disabled at the global level. Device(config)# no device-tracking tracking | Polling is enabled on an interface or VLAN. Device(config-device-tracking)# tracking enable | Polling is effective on the interface or VLAN. |
| | Polling is disabled on an interface or VLAN. Device(config-device-tracking)# tracking disable | Polling is not effective on the interface or VLAN. |
| | Default polling is configured on the interface or VLAN. Device(config-device-tracking)# default tracking | Polling is not effective on the interface or VLAN. |
| | The no form of the command is configured on the interface or VLAN. Device(config-device-tracking)# no tracking | Polling is not effective on the interface or VLAN. |

device-tracking upgrade-cli

To convert legacy IP Device Tracking (IPDT) and IPv6 Snooping commands to SISF commands, configure the **device-tracking upgrade-cli** command in global configuration mode. To revert to legacy commands, enter the **no** form of the command.

device-tracking upgrade-cli [**force** | **revert**]

no device-tracking upgrade-cli [**force** | **revert**]

Syntax Description

force Skips the confirmation step and converts legacy IPDT and IPv6 Snooping commands to SISF commands.

revert Reverts to legacy IPDT and IPv6 Snooping commands.

Command Default

Legacy IPDT and IPv6 Snooping commands remain as-is.

Command Modes

Global configuration [Device(config)#]

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Based on the legacy configuration that exists on your device, the **device-tracking upgrade-cli** global configuration command upgrades your CLI differently. Consider the following configuration scenarios and the corresponding migration results before you migrate your existing configuration.

Note You cannot configure a mix of the old IPDT and IPv6 Snooping commands with the SISF-based device-tracking commands.

Only IPDT Configuration Exists

If your device has only IPDT configuration, running the **device-tracking upgrade-cli** command converts the configuration to use a SISF policy that is created and attached to the interface. You can then update this SISF policy.

If you continue to use the legacy commands, this restricts you to operate in a legacy mode where only the legacy IPDT and IPv6 Snooping commands are available on the device.

Only IPv6 Snooping Configuration Exists

On a device with existing IPv6 Snooping configuration, the old IPv6 Snooping commands are available for further configuration. The following options are available:

- (Recommended) Use the **device-tracking upgrade-cli** command to convert all your legacy configuration to the SISF-based device-tracking commands. After conversion, only the SISF-based device-tracking commands will work on your device.

- Use the legacy IPv6 Snooping commands for your future configuration and do not run the **device-tracking upgrade-cli** command. With this option, only the legacy IPv6 Snooping commands are available on your device, and you cannot use the SISF-based device-tracking commands.

Both IPDT and IPv6 Snooping Configuration Exist

On a device that has both legacy IPDT configuration and IPv6 Snooping configuration, you can convert legacy commands to the SISF-based device-tracking commands. However, note that only one snooping policy can be attached to an interface, and the IPv6 Snooping policy parameters override the IPDT settings.

Note If you do not migrate to the SISF-based device-tracking commands and continue to use the legacy IPv6 Snooping or IPDT commands, your IPv4 device-tracking configuration information may be displayed in the IPv6 Snooping commands, as the SISF-based device-tracking feature handles both IPv4 and IPv6 configuration. To avoid this, we recommend that you convert your legacy configuration to SISF-based device-tracking commands.

No IPDT or IPv6 Snooping Configuration Exists

If your device has no legacy IP Device Tracking or IPv6 Snooping configurations, you can use only the SISF-based device-tracking commands for all your future configuration. The legacy IPDT commands and IPv6 Snooping commands are not available.

Examples

The following example shows you how to convert IPv6 Snooping commands to SISF-based device-tracking commands.

```
Device# show ipv6 snooping features
Feature name  priority state
Device-tracking  128  READY
Source guard   32   READY

Device# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Device(config)# device-tracking upgrade-cli
 IPv6 Snooping and IPv4 device tracking CLI will be
 converted to the new top level device-tracking CLI
Are you sure ? [yes]: yes
Number of Snooping Policies Upgraded: 2
Device(config)# exit
```

After conversion, only the new SISF-based device-tracking commands will work on your device:

```
Device# show ipv6 snooping features
      ^
% Invalid input detected at '^' marker.

Device# show device-tracking features
Feature name  priority state
Device-tracking  128  READY
Source guard   32   READY

Device# show device-tracking policies
Target                Type Policy                Feature                Target range
```

```
Te1/0/4  
vlan 200
```

```
PORT sisf-01  
VLAN sisf-01
```

```
Device-tracking vlan 200  
Device-tracking vlan all
```

dot1x authenticator eap profile

To configure the Extensible Authentication Protocol (EAP) profile to use during 802.1x authentication, use the **dot1x authenticator eap profile** command in interface configuration mode. To disable the EAP profile, use the **no** form of this command.

```
dot1x authenticator eap profile [name]
no dot1x authenticator eap profile
```

Syntax Description

name EAP authenticator profile name.

Command Default

EAP profile is disabled.

Command Modes

Interface configuration (config-if)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Cupertino 17.7.1 | This command was introduced. |

Usage Guidelines

You must enter the **switchport mode access** command on a switch port before entering this command.

The following example shows how to configure Cisco TrustSec manual configuration and 802.1x configurations together:

```
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# switchport mode access
Device(config-if)# cts manual
Device(config-if-cts-manual)# propagate sgt
Device(config-if-cts-manual)# policy static sgt 77 trusted
Device(config-if-cts-manual)# exit
Device(config-if)# dot1x pae authenticator
Device(config-if)# dot1x authenticator eap profile md5
```

Related Commands

| Command | Description |
|-------------------------------|------------------------------------|
| switchport mode access | Sets the trunking mode to access m |

dot1x critical (global configuration)

To configure the IEEE 802.1X critical authentication parameters, use the **dot1x critical** command in global configuration mode.

dot1x critical eapol

| Syntax Description | eapol Specifies that the switch send an EAPOL-Success message when the device successfully authenticates the critical port. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | eapol is disabled | | | | |
| Command Modes | Global configuration (config) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

This example shows how to specify that the device sends an EAPOL-Success message when the device successfully authenticates the critical port:

```
Device> enable
Device# configure terminal
Device(config)# dot1x critical eapol
Device(config)# exit
```

dot1x logging verbose

To filter detailed information from 802.1x system messages, use the **dot1x logging verbose** command in global configuration mode on a device stack or on a standalone device.

```
dot1x logging verbose
no dot1x logging verbose
```

Syntax Description This command has no arguments or keywords.

Command Default Detailed logging of system messages is not enabled.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command filters details, such as anticipated success, from 802.1x system messages. Failure messages are not filtered.

The following example shows how to filter verbose 802.1x system messages:

```
Device> enable
Device# configure terminal
Device(config)# dot1x logging verbose
Device(config)# exit
```

| Related Commands | Command | Description |
|------------------|---------------------------------------|-------------------------------------|
| | authentication logging verbose | Filters details from authentication |
| | dot1x logging verbose | Filters details from 802.1x system |
| | mab logging verbose | Filters details from MAC authentic |

dot1x pae

To set the Port Access Entity (PAE) type, use the **dot1x pae** command in interface configuration mode. To disable the PAE type that was set, use the **no** form of this command.

```
dot1x pae {supplicant | authenticator}
no dot1x pae {supplicant | authenticator}
```

Syntax Description

| | |
|----------------------|---|
| supplicant | The interface acts only as a supplicant and will not respond to messages that are meant for an authenticator. |
| authenticator | The interface acts only as an authenticator and will not respond to any messages meant for a supplicant. |

Command Default

PAE type is not set.

Command Modes

Interface configuration (config-if)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **no dot1x pae** interface configuration command to disable IEEE 802.1x authentication on the port.

When you configure IEEE 802.1x authentication on a port, such as by entering the **dot1x port-control** interface configuration command, the device automatically configures the port as an IEEE 802.1x authenticator. After the **no dot1x pae** interface configuration command is entered, the Authenticator PAE operation is disabled.

The following example shows that the interface has been set to act as a supplicant:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/3
Device(config-if)# dot1x pae supplicant
Device(config-if)# end
```

dot1x supplicant controlled transient

To control access to an 802.1x supplicant port during authentication, use the **dot1x supplicant controlled transient** command in global configuration mode. To open the supplicant port during authentication, use the **no** form of this command

dot1x supplicant controlled transient
no dot1x supplicant controlled transient

Syntax Description

This command has no arguments or keywords.

Command Default

Access is allowed to 802.1x supplicant ports during authentication.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

In the default state, when you connect a supplicant device to an authenticator switch that has BPCU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. You can control traffic exiting the supplicant port during the authentication period. Entering the **dot1x supplicant controlled transient** command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the **no dot1x supplicant controlled transient** command opens the supplicant port during the authentication period. This is the default behavior.

We recommend using the **dot1x supplicant controlled transient** command on a supplicant device when BPDU guard is enabled on the authenticator switch port with the **spanning-tree bpduguard enable** interface configuration command.

This example shows how to control access to 802.1x supplicant ports on a device during authentication:

```
Device> enable
Device# configure terminal
Device(config)# dot1x supplicant controlled transient
Device(config)# exit
```

dot1x supplicant force-multicast

To force a supplicant switch to send only multicast Extensible Authentication Protocol over LAN (EAPOL) packets whenever it receives multicast or unicast EAPOL packets, use the **dot1x supplicant force-multicast** command in global configuration mode. To return to the default setting, use the **no** form of this command.

dot1x supplicant force-multicast
no dot1x supplicant force-multicast

Syntax Description This command has no arguments or keywords.

Command Default The supplicant device sends unicast EAPOL packets when it receives unicast EAPOL packets. Similarly, it sends multicast EAPOL packets when it receives multicast EAPOL packets.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Enable this command on the supplicant device for Network Edge Access Topology (NEAT) to work in all host modes.

This example shows how force a supplicant device to send multicast EAPOL packets to the authenticator device:

```
Device> enable
Device# configure terminal
Device(config)# dot1x supplicant force-multicast
Device(config)# end
```

Related Commands

| Command | Description |
|-----------------------------|--|

| dot1x credentials | Configures the 802.1x supplicant cred |
| dot1x pae supplicant | Configures an interface to act only as a |

dot1x test eapol-capable

To monitor IEEE 802.1x activity on all the switch ports and to display information about the devices that are connected to the ports that support IEEE 802.1x, use the **dot1x test eapol-capable** command in privileged EXEC mode.

```
dot1x test eapol-capable [interface interface-id]
```

| Syntax Description | interface <i>interface-id</i> (Optional) Port to be queried. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | There is no default setting. | | | | |
| Command Modes | Privileged EXEC (#) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines Use this command to test the IEEE 802.1x capability of the devices connected to all ports or to specific ports on a switch.

There is not a no form of this command.

This example shows how to enable the IEEE 802.1x readiness check on a switch to query a port. It also shows the response received from the queried port verifying that the device connected to it is IEEE 802.1x-capable:

```
Device> enable
Device# dot1x test eapol-capable interface gigabitethernet1/0/13

DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL
capable
```

| | | |
|-------------------------|--|---|
| Related Commands | Command | Description |
| | dot1x test timeout <i>timeout</i> | Configures the timeout used to readiness query. |

dot1x test timeout

To configure the timeout used to wait for EAPOL response from a port being queried for IEEE 802.1x readiness, use the **dot1x test timeout** command in global configuration mode.

dot1x test timeout *timeout*

| | | |
|---------------------------|------------------------------------|--|
| Syntax Description | <i>timeout</i> | Time in seconds to wait for an EAPOL response. The range is from 1 to 65535 seconds. |
| Command Default | The default setting is 10 seconds. | |
| Command Modes | Global configuration (config) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use this command to configure the timeout used to wait for EAPOL response.

There is not a no form of this command.

This example shows how to configure the switch to wait 27 seconds for an EAPOL response:

```
Device> enable
Device# dot1x test timeout 27
```

You can verify the timeout configuration status by entering the **show running-config** command.

| Related Commands | Command | Description |
|-------------------------|---|---|
| | dot1x test eapol-capable [interface interface-id] | Checks for IEEE 802.1x readiness on devices connected to all or to specified IEEE 802.1x-capable ports. |

dot1x timeout

To configure the value for retry timeouts, use the **dot1x timeout** command in global configuration or interface configuration mode. To return to the default value for retry timeouts, use the **no** form of this command.

dot1x timeout { **auth-period** *seconds* | **held-period** *seconds* | **quiet-period** *seconds* | **ratelimit-period** *seconds* | **server-timeout** *seconds* | **start-period** *seconds* | **supp-timeout** *seconds* | **tx-period** *seconds* }

| Syntax Description | | |
|--|---|--|
| auth-period <i>seconds</i> | Configures the time, in seconds for which a supplicant will stay in the HELD state (that is, the length of time it will wait before trying to send the credentials again after a failed attempt). | The range is from 1 to 65535. The default is 30. |
| held-period <i>seconds</i> | Configures the time, in seconds for which a supplicant will stay in the HELD state (that is, the length of time it will wait before trying to send the credentials again after a failed attempt). | The range is from 1 to 65535. The default is 60 |
| quiet-period <i>seconds</i> | Configures the time, in seconds, that the authenticator (server) remains quiet (in the HELD state) following a failed authentication exchange before trying to reauthenticate the client. | The range is from 1 to 65535. The default is 60 |
| ratelimit-period <i>seconds</i> | Throttles the EAP-START packets that are sent from misbehaving client PCs (for example, PCs that send EAP-START packets that result in the wasting of device processing power). <ul style="list-style-type: none"> The authenticator ignores EAPOL-Start packets from clients that have successfully authenticated for the rate-limit period duration. The range is from 1 to 65535. By default, rate limiting is disabled. | |
| server-timeout <i>seconds</i> | Configures the interval, in seconds, between two successive EAPOL-Start frames when they are being retransmitted. <ul style="list-style-type: none"> The range is from 1 to 65535. The default is 30. If the server does not send a response to an 802.1X packet within the specified period, the packet is sent again. | |
| start-period <i>seconds</i> | Configures the interval, in seconds, between two successive EAPOL-Start frames when they are being retransmitted. | The range is from 1 to 65535. The default is 30. |

supp-timeout *seconds* Sets the authenticator-to-suppliant retransmission time for all EAP messages other than EAP Request ID.

The range is from 1 to 65535. The default is 30.

tx-period *seconds* Configures the number of seconds between retransmission of EAP request ID packets (assuming that no response is received) to the client.

- The range is from 1 to 65535. The default is 30.
- If an 802.1X packet is sent to the supplicant and the supplicant does not send a response after the retry period, the packet will be sent again.

Command Default Periodic reauthentication and periodic rate-limiting are done.

Command Modes Global configuration (config)
Interface configuration (config-if)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

The **dot1x timeout reauth-period** interface configuration command affects the behavior of the device only if you have enabled periodic re-authentication by using the **dot1x reauthentication** interface configuration command.

During the quiet period, the device does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number smaller than the default.

When the **ratelimit-period** is set to 0 (the default), the device does not ignore EAPOL packets from clients that have been successfully authenticated and forwards them to the RADIUS server.

The following example shows that various 802.1X retransmission and timeout periods have been set:

```
Device> enable
Device(config)# configure terminal
Device(config)# interface gigabitethernet 1/0/3
Device(config-if)# dot1x port-control auto
Device(config-if)# dot1x timeout auth-period 2000
Device(config-if)# dot1x timeout held-period 2400
Device(config-if)# dot1x timeout quiet-period 600
Device(config-if)# dot1x timeout start-period 90
Device(config-if)# dot1x timeout supp-timeout 300
Device(config-if)# dot1x timeout tx-period 60
Device(config-if)# dot1x timeout server-timeout 60
Device(config-if)# end
```

dscp

To configure DSCP marking for authentication and accounting on RADIUS packets, use the **dscp** command. To disable DSCP marking for authentication and accounting on RADIUS packets, use the **no** form of this command

```
dscp { acct dscp_acct_value | auth dscp_auth_value }
```

```
no dscp { acct dscp_acct_value | auth dscp_auth_value }
```

Syntax Description

acct *dscp_acct_value* Configures RADIUS DSCP marking value for accounting. The valid range is from 1 to 63. The default value is 0.

auth *dscp_auth_value* Configures RADIUS DSCP marking value for authentication. The valid range is from 1 to 63. The default value is 0.

Command Default

The DSCP marking on RADIUS packets is disabled by default.

Command Modes

RADIUS server configuration (config-radius-server)
RADIUS server group configuration (config-sg-radius)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

Example

This example shows how to configure DSCP marking for authentication and accounting on RADIUS packets for a RADIUS server:

```
Device(config)#radius server abc
Device(config-radius-server)#address ipv4 10.1.1.1 auth-port 1645 acct-port 1646
Device(config-radius-server)#dscp auth 10 acct 20
Device(config-radius-server)#key cisco123
Device(config-radius-server)#end
```

This example shows how to configure DSCP marking for authentication and accounting on RADIUS packets for a RADIUS server group:

```
Device(config)#aaa group server radius xyz
Device(config-sg-radius)#server name abc
Device(config-sg-radius)#ip radius source-interface Vlan18
Device(config-sg-radius)#dscp auth 30 acct 10
Device(config-sg-radius)#end
```

dtls

To configure Datagram Transport Layer Security (DTLS) parameters, use the **dtls** command in radius server configuration mode. To return to the default setting, use the **no** form of this command.

```
dtls [{ connectiontimeout connection-timeout-value | idletimeout idle-timeout-value | [{ ip | ipv6 }] {
radius source-interface interface-name | vrf forwarding forwarding-table-name } | match-server-identity
{ email-address email-address | hostname hostname | ip-address ip-address } | port port-number |
retries number-of-connection-retries | trustpoint { client trustpoint name | server trustpoint name } }
```

no dtls

Syntax Description

| | |
|---|--|
| connectiontimeout <i>connection-timeout-value</i> | (Optional) Configures the DTLS connection timeout value. |
| idletimeout <i>idle-timeout-value</i> | (Optional) Configures the DTLS idle timeout value. |
| [ip ipv6] { radius source-interface <i>interface-name</i> vrf forwarding <i>forwarding-table-name</i> } | (Optional) Configures IP or IPv6 source parameters. |
| match-server-identity { email-address <i>email-address</i> hostname <i>host-name</i> ip-address <i>ip-address</i> } | Configures RadSec certification validation parameters. |
| port <i>port-number</i> | (Optional) Configures the DTLS port number. |
| retries <i>number-of-connection-retries</i> | (Optional) Configures the number of DTLS connection retries. |
| trustpoint { client <i>trustpoint name</i> server <i>trustpoint name</i> } | (Optional) Configures the DTLS trustpoint for the client and the server. |

Command Default

- The default value of DTLS connection timeout is 5 seconds.
- The default value of DTLS idle timeout is 60 seconds.
- The default DTLS port number is 2083.
- The default value of DTLS connection retries is 5.

Command Modes

Radius server configuration (config-radius-server)

Command History

| Release | Modification |
|--------------------------------|--|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Gibraltar 16.10.1 | The match-server-identity keyword was introduced. |
| Cisco IOS XE Amsterdam 17.1.1 | The ipv6 keyword was introduced. |

Usage Guidelines

We recommend that you use the same server type, either only Transport Layer Security (TLS) or only DTLS, under an Authentication, Authorization, and Accounting (AAA) server group.

Examples

The following example shows how to configure the DTLS connection timeout value to 10 seconds:

```
Device> enable
Device# configure terminal
Device(config)# radius server R1
Device(config-radius-server)# dtls connectiontimeout 10
Device(config-radius-server)# end
```

Related Commands

| Command | Description |
|--|--|
| show aaa servers | Displays information related to the DTLS server. |
| clear aaa counters servers radius | Clears the RADIUS DTLS-specific statistics. |
| debug radius dtls | Enables RADIUS DTLS-specific debugs. |

enable password

To set a local password to control access to various privilege levels, use the **enable password** command in global configuration mode. To remove control access of the local password, use the **no** form of this command.

```
enable [ common-criteria-policy policy-name ] password [ level level ] { [ 0 ] unencrypted-password
| [ encryption-type ] encrypted-password }
no enable [ common-criteria-policy policy-name ] password [ level level ]
```

Syntax Description

| | |
|---|--|
| common-criteria-policy <i>policy-name</i> | (Optional) Specifies a AAA common criteria policy name. |
| level <i>level</i> | (Optional) Specifies the level for which the password is applicable. You can specify levels, using numbers 0 through 15. Level 1 is normal user EXEC mode user privilege. If a level is specified in the command or in the no form of the command, the privilege level default is 15. |
| 0 | (Optional) Specifies an unencrypted cleartext password. The password is converted to a SHA-256 secret and is stored in the device. |
| <i>unencrypted-password</i> | Specifies the password to enter enable mode. |
| <i>encryption-type</i> | (Optional) Cisco-proprietary algorithm used to encrypt the password. If you specify an encryption type, the next argument that you supply must be an encrypted password (a password already stored in the device). You can specify type 7, which indicates that a hidden password follows. |
| <i>encrypted-password</i> | Encrypted password copied from another device configuration. |

Command Default

No password is defined.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-------------------------------|--|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Cupertino 17.8.1 | The command was modified. The common-criteria-policy option was added. The common-criteria-policy keyword was added. |

Usage Guidelines

For the **common-criteria-policy** option, specify a policy name defined using the **aaa common-criteria policy** command. If you select this option, the password must be set based on the criteria defined in that particular AAA common criteria policy.

Note

- The **aaa new-model** and **aaa common-criteria policy** commands must be configured before attaching the **common-criteria-policy** option to the password.
- The **common-criteria-policy** option is not supported for the **enable secret** command.

If neither the **enable password** command nor the **enable secret** command is configured, and if a line password is configured for the console, the console line password serves as the enable password for all VTY (Telnet and Secure Shell [SSH]) sessions.

Use the **enable password** command with the **level** option to define a password for a specific privilege level. After you specify the level and the password, share the password with users who need to access this level. Use the **privilege level** configuration command to specify the commands that are accessible at various levels.

Typically, you enter an encryption type only if you copy and paste a password that has already been encrypted by a Cisco device, into this command.

Caution If you specify an encryption type and then enter a cleartext password, you will not be able to re-enter enable mode. You cannot recover a lost password that has been encrypted earlier.

If the **service password-encryption** command is set, the encrypted form of the password you create with the **enable password** command is displayed when the **more nvram:startup-config** command is run.

You can enable or disable password encryption with the **service password-encryption** command.

An enable password is defined as follows:

- Must contain a combination of numerals from 1 to 25, and uppercase and lowercase alphanumeric characters.
- Can have leading spaces, but they are ignored. However, intermediate and trailing spaces are recognized.
- Can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password, for example, to create the password *abc?123*, do the following:
 1. Enter **abc**.
 2. Press **Ctrl-v**.
 3. Enter **?123**.

Note When the system prompts you to enter the **enable password** command, you need not precede the question mark with Ctrl-V; you can enter **abc?123** at the password prompt.

Examples

The following example shows how to enable the password pswd2 for privilege level 2:

```
Device> enable
Device# configure terminal
Device(config)# enable password level 2 pswd2
```

The following example shows how to set the encrypted password \$1\$i5Rkls3LoyxzS8t9, which has been copied from a device configuration file, for privilege level 2 using encryption type 7:

```
Device> enable
Device# configure terminal
Device(config)# enable password level 2 5 $1$i5Rkls3LoyxzS8t9
```

Related Commands

| Command | Description |
|------------------------------------|---|
| enable secret | Specifies an additional layer of security over the enable password . |
| more nvram:startup-config | Displays the startup configuration file contained in NVRAM. The CONFIG_FILE environment variable. |
| privilege level | Sets the privilege level for the user. |
| service password-encryption | Encrypts a password. |

enable secret

To specify an additional layer of security over the **enable password** command, use the **enable secret** command in global configuration mode. To turn off the enable secret function, use the **no** form of this command.

enable secret [**level** *level*] {[**0**] *unencrypted-password* | *encryption-type encrypted-password*}
no enable secret [**level** *level*] [*encryption-type encrypted-password*]

| Syntax Description | | |
|-----------------------------|---|--|
| level <i>level</i> | (Optional) Specifies the level for which the password is applicable. You can specify levels, using numerals 1 through 15. Level 1 is normal user EXEC mode privileges in the command or in the no form of the command, the privilege level defaults to 15. | |
| 0 | (Optional) Specifies an unencrypted cleartext password. The password is converted to a SHA-256 secret and is stored in the device. | |
| <i>unencrypted-password</i> | Specifies the password for users to enter enable mode. This password should be different from the enable password created with the enable password command. | |
| <i>encryption-type</i> | Cisco-proprietary algorithm used to hash the password: <ul style="list-style-type: none"> • 5: Specifies a message digest algorithm 5-encrypted (MD5-encrypted) secret. • 8: Specifies a Password-Based Key Derivation Function 2 (PBKDF2) with 9600 iterations. • 9: Specifies a scrypt-hashed secret. | |
| <i>encrypted-password</i> | Hashed password that is copied from another device configuration. | |

Command Default No password is defined.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines If neither the **enable password** command or the **enable secret** command is configured, and if a line password is configured for the console, the console line password serves as the enable password for all vty (Telnet and Secure Shell [SSH]) sessions.

Use the **enable secret** command to provide an additional layer of security over the **enable password** password. The **enable secret** command provides better security by storing the password using a nonreversible cryptographic function. The additional layer of security encryption is useful in environments where the password is sent to the network or is stored on a TFTP server.

Typically, you enter an encryption type only when you paste an encrypted password that you copied from a device configuration file, into this command.

Caution If you specify an encryption type and then enter a cleartext password, you will not be able to reenter enable mode. You cannot recover a lost password that has been encrypted earlier.

If you use the same password for the **enable password** and **enable secret** commands, you receive an error message warning that this practice is not recommended, but the password will be accepted. By using the same password, however, you undermine the additional security the **enable secret** command provides.

Note After you set a password using the **enable secret** command, a password set using the **enable password** command works only if the **enable secret** is disabled. Additionally, you cannot recover a lost password that has been encrypted by any method.

If the **service password-encryption** command is set, the encrypted form of the password you create is displayed when the **more nvram:startup-config** command is run.

You can enable or disable password encryption with the **service password-encryption** command.

An enable password is defined as follows:

- Must contain a combination of numerals from 1 to 25, and uppercase and lowercase alphanumeric characters.
- Can have leading spaces, but they are ignored. However, intermediate and trailing spaces are recognized.
- Can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password *abc?123*, do the following:
 1. Enter **abc**.
 2. Press **Ctrl-v**.
 3. Enter **?123**.

Note When the system prompts you to enter the **enable password** command, you need not precede the question mark with Ctrl-v; you can enter **abc?123** at the password prompt.

Examples

The following example shows how to specify a password with the **enable secret** command:

```
Device> enable
Device# configure terminal
Device(config)# enable secret password
```

After specifying a password with the **enable secret** command, users must enter this password to gain access. Otherwise, passwords set using the **enable password** command will no longer work.

```
Password: password
```

The following example shows how to enable the encrypted password \$1\$FaD0\$Xyti5Rkls3LoyxzS8, which has been copied from a device configuration file, for privilege level 2, using the encryption type 4:

```
Device> enable
Device# configure terminal
Device(config)# enable password level 2 4 $1$FaD0$Xyti5Rkls3LoyxzS8
```

The following example shows the warning message that is displayed when a user enters the **enable secret 4 encrypted-password** command:

```
Device> enable
Device# configure terminal
Device(config)# enable secret 4 tnhtc92DXBhelxjYk8LWJrPV36S2i4ntXrpb4RFmfqY
```

```
WARNING: Command has been added to the configuration but Type 4 passwords have been
deprecated.
Migrate to a supported password type
```

```
Device(config)# end
Device# show running-config | inc secret
```

```
enable secret 4 tnhtc92DXBhelxjYk8LWJrPV36S2i4ntXrpb4RFmfqY
```

Related Commands

| Command | Description |
|------------------------------------|---|
| enable password | Sets a local password to control access to various privileges. |
| more nvram:startup-config | Displays the startup configuration file contained in NVRAM. The CONFIG_FILE environment variable can be used to specify the configuration file. |
| service password-encryption | Encrypt passwords. |

epm access-control open

To configure an open directive for ports that do not have an access control list (ACL) configured, use the **epm access-control open** command in global configuration mode. To disable the open directive, use the **no** form of this command.

epm access-control open
no epm access-control open

Syntax Description This command has no arguments or keywords.

Command Default The default directive applies.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use this command to configure an open directive that allows hosts without an authorization policy to access ports configured with a static ACL. If you do not configure this command, the port applies the policies of the configured ACL to the traffic. If no static ACL is configured on a port, both the default and open directives allow access to the port.

You can verify your settings by entering the **show running-config** command.

This example shows how to configure an open directive.

```
Device> enable
Device# configure terminal
Device(config)# epm access-control open
Device(config)# exit
```

| Related Commands | Command | Description |
|------------------|----------------------------|--|
| | show running-config | Displays the contents of the current running configuration file. |

fqdn ttl-timeout factor

To configure the time-to-live (TTL) timeout factor of a FQDN local cache entry, use the **fqdn ttl-timeout factor** command in global configuration mode. To remove the TTL timeout factor, use the **no** form of this command.

fqdn ttl-timeout factor { *ttl-timeout* | **infinite** }

no fqdn ttl-timeout factor { *ttl-timeout* | **infinite** }

Syntax Description

ttl-timeout Specifies the TTL timeout factor. The range is from 1 to 300.

infinite The FQDN entry stays forever.

Command Default

The default TTL timeout factor is 10.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-------------------------------|-----------------------------|
| Cisco IOS XE Bengaluru 17.5.1 | The command was introduced. |

Usage Guidelines

The local TTL value for the cached FQDN entry is calculated based on the TTL value received in the DNS response packet multiplied by the configured TTL timeout factor. For example, if the received DNS response has a TTL value of 100 seconds and multiplication factor is set to 10, then the local TTL for the cached FQDN entry will be 1000 seconds.

Examples

The following example shows how to set the FQDN TTL timeout factor:

```
Device> enable
Device# configure terminal
Device(config)# fqdn ttl-timeout-factor 100
```

include-icv-indicator

To include the integrity check value (ICV) indicator in MKPDU, use the **include-icv-indicator** command in MKA-policy configuration mode. To disable the ICV indicator, use the **no** form of this command.

include-icv-indicator
no include-icv-indicator

Syntax Description This command has no arguments or keywords.

Command Default ICV indicator is included.

Command Modes MKA-policy configuration (config-mka-policy)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example shows how to include the ICV indicator in MKPDU:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# include-icv-indicator
```

Related Commands

| Command | Description |
|----------------------------------|--|
| mka policy | Configures an MKA policy. |
| confidentiality-offset | Sets the confidentiality offset for MACsec operations. |
| delay-protection | Configures MKA to use delay protection in sending MKPDU. |
| key-server | Configures MKA key-server options. |
| macsec-cipher-suite | Configures cipher suite for deriving SAK. |
| sak-rekey | Configures the SAK rekey interval. |
| send-secure-announcements | Configures MKA to send secure announcements in sending MKPDUs. |
| ssci-based-on-sci | Computes SSCI based on the SCI. |
| use-updated-eth-header | Uses the updated Ethernet header for ICV calculation. |

ip access-list

To define an IP access list or object-group access control list (ACL) by name or number or to enable filtering for packets with IP helper-address destinations, use the **ip access-list** command in global configuration mode. To remove the IP access list or object-group ACL or to disable filtering for packets with IP helper-address destinations, use the **no** form of this command.

```
ip access-list { extended | resequence | standard } { access-list-number access-list-name } | helper egress check | log-update threshold threshold-number | logging { hash-generation | interval time } | persistent | role-based access-list-name | fqdn access-list-name }
no ip access-list { { extended | resequence | standard } { access-list-number access-list-name } | helper egress check | log-update threshold | logging { hash-generation | interval } | persistent | role-based access-list-name | fqdn access-list-name }
```

Syntax Description

| | |
|---|---|
| standard | Specifies a standard IP access list. |
| resequence | Specifies a resequenced IP access list. |
| extended | Specifies an extended IP access list. Required for object-group ACLs. |
| <i>access-list-name</i> | Name of the IP access list or object-group ACL. Names cannot contain a space or quotation mark, and must begin with an alphabetic character to prevent ambiguity with numbered access lists. |
| <i>access-list-number</i> | Number of the access list. <ul style="list-style-type: none"> • A standard IP access list is in the ranges 1-99 or 1300-1999. • An extended IP access list is in the ranges 100-199 or 2000-2699. |
| helper egress check | Enables permit or deny matching capability for an outbound access list that is applied to an interface, for traffic that is relayed via the IP helper feature to a destination server address. |
| log-update | Controls the access list log updates. |
| threshold <i>threshold-number</i> | Sets the access list logging threshold. The range is 0 to 2147483647. |
| logging | Controls the access list logging. |
| hash-generation | Enables syslog hash code generation. |
| interval <i>time</i> | Sets the access list logging interval in milliseconds. The range is 0 to 2147483647. |
| persistent | Access control entry (ACE) sequence numbers are persistent across reloads. Note This is enabled by default and cannot be disabled. |
| role-based | Specifies a role-based IP access list. |

| | |
|-------------|---------------------------------------|
| fqdn | Specifies a FQDN IP access list. |
| Note | The name must start with an alphabet. |

Command Default No IP access list or object-group ACL is defined, and outbound ACLs do not match and filter IP helper relayed traffic.

Command Modes Global configuration (config)

| Release | Modification |
|-------------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Bengaluru 17.4.1 | The fqdn keyword was introduced. |

Usage Guidelines Use this command to configure a named or numbered IP access list or an object-group ACL. This command places the device in access-list configuration mode, where you must define the denied or permitted access conditions by using the **deny** and **permit** commands.

Specifying the **standard** or **extended** or **fqdn** keyword with the **ip access-list** command determines the prompt that appears when you enter access-list configuration mode. You must use the **extended** keyword when defining object-group ACLs.

You can create object groups and IP access lists or object-group ACLs independently, which means that you can use object-group names that do not yet exist.

Use the **ip access-group** command to apply the access list to an interface.

The **ip access-list helper egress check** command enables outbound ACL matching for permit or deny capability on packets with IP helper-address destinations. When you use an outbound extended ACL with this command, you can permit or deny IP helper relayed traffic based on source or destination User Datagram Protocol (UDP) ports. The **ip access-list helper egress check** command is disabled by default; outbound ACLs will not match and filter IP helper relayed traffic.

Examples

The following example defines a standard access list named Internetfilter:

```
Device> enable
Device# configure terminal
Device(config)# ip access-list standard Internetfilter
Device(config-std-nacl)# permit 192.168.255.0 0.0.0.255
Device(config-std-nacl)# permit 10.88.0.0 0.0.255.255
Device(config-std-nacl)# permit 10.0.0.0 0.255.255.255
```

The following example shows how to set the FQDN TTL timeout factor and create an FQDN ACL named facl.

```
Device> enable
Device# configure terminal
Device(config)# fqdn ttl-timeout-factor 100
Device(config)# ip access-list fqdn facl
Device(config-fqdn-acl)# 100 permit ip any any
Device(config-fqdn-acl)# 10 permit ip host 192.0.2.121 host dynamic www.google.com
Device(config-fqdn-acl)# end
```

The following example shows how to create an object-group ACL that permits packets from the users in `my_network_object_group` if the protocol ports match the ports specified in `my_service_object_group`:

```
Device> enable
Device# configure terminal
Device(config)# ip access-list extended my_ogacl_policy
Device(config-ext-nacl)# permit tcp object-group my_network_object_group portgroup
my_service_object_group any
Device(config-ext-nacl)# deny tcp any any
```

The following example shows how to enable outbound ACL filtering on packets with helper-address destinations:

```
Device> enable
Device# configure terminal
Device(config)# ip access-list helper egress check
```

Related Commands

| Command | Description |
|-----------------------------|---|
| deny | Sets conditions in a named IP access list or in an object-group ACL that will deny packets. |
| ip access-group | Applies an ACL or an object-group ACL to an interface or a service policy map. |
| object-group network | Defines network object groups for use in object-group ACLs. |
| object-group service | Defines service object groups for use in object-group ACLs. |
| permit | Sets conditions in a named IP access list or in an object-group ACL that will permit packets. |
| show ip access-list | Displays the contents of IP access lists or object-group ACLs. |
| show object-group | Displays information about object groups that are configured. |

ip access-list role-based

To create a role-based (security group) access control list (RBACL) and enter role-based ACL configuration mode, use the **ip access-list role-based** command in global configuration mode. To remove the configuration, use the **no** form of this command.

```
ip access-list role-based access-list-name
no ip access-list role-based access-list-name
```

| | |
|---------------------------|---|
| Syntax Description | <i>access-list-name</i> Name of the security group access control list (SGACL). |
|---------------------------|---|

| | |
|------------------------|-------------------------------------|
| Command Default | Role-based ACLs are not configured. |
|------------------------|-------------------------------------|

| | |
|----------------------|-------------------------------|
| Command Modes | Global configuration (config) |
|----------------------|-------------------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | For SGACL logging, you must configure the permit ip log command. Also, this command must be configured in Cisco Identity Services Engine (ISE) to enable logging for dynamic SGACLs. |
|-------------------------|---|

The following example shows how to define an SGACL that can be applied to IPv4 traffic and enter role-based access list configuration mode:

```
Device> enable
Device# configure terminal
Device(config)# ip access-list role-based rbacl1
Device(config-rb-acl)# permit ip log
Device(config-rb-acl)# end
```

| Related Commands | Command | Description |
|-------------------------|----------------------------|--|
| | permit ip log | Permits logging that matches the configured entry. |
| | show ip access-list | Displays contents of all current IP access lists. |

ip admission

To enable web authentication, use the **ip admission** command in interface configuration mode or fallback-profile configuration mode. To disable web authentication, use the **no** form of this command.

ip admission *rule*
no ip admission *rule*

Syntax Description

rule IP admission rule name.

Command Default

Web authentication is disabled.

Command Modes

Interface configuration (config-if)

Fallback-profile configuration (config-fallback-profile)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **ip admission** command applies a web authentication rule to a switch port.

This example shows how to apply a web authentication rule to a switchport:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip admission rule1
Device(config-if)# end
```

This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.

```
Device> enable
Device# configure terminal
Device(config)# fallback profile profile1
Device(config-fallback-profile)# ip admission rule1
Device(config-fallback-profile)# end
```

ip admission name

To enable web authentication, use the **ip admission name** command in global configuration mode. To disable web authentication, use the **no** form of this command.

ip admission name *name* { **consent** | **proxy http** } [**absolute timer** *minutes* | **inactivity-time** *minutes* | **list** { *acl* | *acl-name* } | **service-policy type tag** *service-policy-name*]
no ip admission name *name* { **consent** | **proxy http** } [**absolute timer** *minutes* | **inactivity-time** *minutes* | **list** { *acl* | *acl-name* } | **service-policy type tag** *service-policy-name*]

Syntax Description

| | |
|---------------------------------------|---|
| <i>name</i> | Name of network admission control rule. |
| consent | Associates an authentication proxy consent web page with the IP admission rule specified using the <i>admission-name</i> argument. |
| proxy http | Configures web authentication custom page. |
| absolute-timer <i>minutes</i> | (Optional) Elapsed time, in minutes, before the external server times out. |
| inactivity-time <i>minutes</i> | (Optional) Elapsed time, in minutes, before the external file server is deemed unreachable. |
| list | (Optional) Associates the named rule with an access control list (ACL). |
| <i>acl</i> | Applies a standard, extended list to a named admission control rule. The value ranges from 1 through 199, or from 1300 through 2699 for expanded range. |
| <i>acl-name</i> | Applies a named access list to a named admission control rule. |
| service-policy type tag | (Optional) A control plane service policy is to be configured. |
| <i>service-policy-name</i> | Control plane tag service policy that is configured using the policy-map type control tag <i>polycyname</i> command, keyword, and argument. This policy map is used to apply the actions on the host when a tag is received. |

Command Default

Web authentication is disabled.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **ip admission name** command globally enables web authentication on a switch.

After you enable web authentication on a switch, use the **ip access-group in** and **ip admission web-rule** interface configuration commands to enable web authentication on a specific interface.

Examples

This example shows how to configure only web authentication on a switch port:

```
Device> enable
Device# configure terminal
Device(config) ip admission name http-rule proxy http
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 101 in
Device(config-if)# ip admission rule
Device(config-if)# end
```

This example shows how to configure IEEE 802.1x authentication with web authentication as a fallback mechanism on a switch port:

```
Device> enable
Device# configure terminal
Device(config)# ip admission name rule2 proxy http
Device(config)# fallback profile profile1
Device(config)# ip access group 101 in
Device(config)# ip admission name rule2
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# dot1x port-control auto
Device(config-if)# dot1x fallback profile1
Device(config-if)# end
```

Related Commands

| Command | Description |
|---|--|
| dot1x fallback | Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. |
| fallback profile | Creates a web authentication fallback profile. |
| ip admission | Enables web authentication on a port. |
| show authentication sessions interface <i>interface</i> detail | Displays information about the web authentication session status. |
| show ip admission | Displays information about NAC cached entries or the NAC configuration. |

ip dhcp snooping database

To configure the Dynamic Host Configuration Protocol (DHCP)-snooping database, use the **ip dhcp snooping database** command in global configuration mode. To disable the DHCP-snooping database, use the **no** form of this command.

```
ip dhcp snooping database { crashinfo: url | flash: url | ftp: url | http: url | https: url
| rcp: url | scp: url | tftp: url | timeout seconds | usbflash0: url | write-delay
seconds }
no ip dhcp snooping database [ timeout | write-delay ]
abon
```

| Syntax Description | | |
|--------------------|------------------------|--|
| | crashinfo: url | Specifies the database URL for storing entries using crashinfo. |
| | flash: url | Specifies the database URL for storing entries using flash. |
| | ftp: url | Specifies the database URL for storing entries using FTP. |
| | http: url | Specifies the database URL for storing entries using HTTP. |
| | https: url | Specifies the database URL for storing entries using secure HTTP (https). |
| | rcp: url | Specifies the database URL for storing entries using remote copy (rcp). |
| | scp: url | Specifies the database URL for storing entries using Secure Copy (SCP). |
| | tftp: url | Specifies the database URL for storing entries using TFTP. |
| | timeout seconds | Specifies the cancel timeout interval; valid values are from 0 to 86400 seconds. |
| | usbflash0: url | Specifies the database URL for storing entries using USB flash. |

| | |
|-----------------------------------|--|
| write-delay <i>seconds</i> | Specifies the amount of time before writing the DHCP-snooping entries to an external server after a change is seen in the local DHCP-snooping database; valid values are from 15 to 86400 seconds. |
|-----------------------------------|--|

Command Default The DHCP-snooping database is not configured.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines You must enable DHCP snooping on the interface before entering this command. Use the **ip dhcp snooping** command to enable DHCP snooping.

This example shows how to specify the database URL using TFTP:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp snooping database tftp://10.90.90.90/snooping-rp2
Device(config)# exit
```

This example shows how to specify the amount of time before writing DHCP snooping entries to an external server:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp snooping database write-delay 15
Device(config)# exit
```

ip dhcp snooping information option format remote-id

To configure the option-82 remote-ID suboption, use the **ip dhcp snooping information option format remote-id** command in global configuration mode on the device to configure the option-82 remote-ID suboption. To configure the default remote-ID suboption, use the **no** form of this command.

```
ip dhcp snooping information option format remote-id {hostname | string string}
no ip dhcp snooping information option format remote-id {hostname | string string}
```

| Syntax Description | hostname Specify the device hostname as the remote ID. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| | string string Specify a remote ID, using from 1 to 63 ASCII characters (no spaces). | | | | |
| Command Default | The device MAC address is the remote ID. | | | | |
| Command Modes | Global configuration (config) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines

You must globally enable DHCP snooping by using the **ip dhcp snooping** global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled, the default remote-ID suboption is the device MAC address. This command allows you to configure either the device hostname or a string of up to 63 ASCII characters (but no spaces) to be the remote ID.

Note If the hostname exceeds 63 characters, it will be truncated to 63 characters in the remote-ID configuration.

This example shows how to configure the option- 82 remote-ID suboption:

```
Device> enable
Device# configure terminal
Device(config)# ip dhcp snooping information option format remote-id hostname
Device(config)# exit
```

ip dhcp snooping verify no-relay-agent-address

To disable the DHCP snooping feature from verifying that the relay agent address (giaddr) in a DHCP client message matches the client hardware address on an untrusted port, use the **ip dhcp snooping verify no-relay-agent-address** command in global configuration mode. To enable verification, use the **no** form of this command.

ip dhcp snooping verify no-relay-agent-address
no ip dhcp snooping verify no-relay-agent-address

Syntax Description

This command has no arguments or keywords.

Command Default

The DHCP snooping feature verifies that the relay-agent IP address (giaddr) field in DHCP client message on an untrusted port is 0.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

By default, the DHCP snooping feature verifies that the relay-agent IP address (giaddr) field in DHCP client message on an untrusted port is 0; the message is dropped if the giaddr field is not 0. Use the **ip dhcp snooping verify no-relay-agent-address** command to disable the verification. Use the **no ip dhcp snooping verify no-relay-agent-address** to reenable verification.

This example shows how to enable verification of the giaddr in a DHCP client message:

```
Device> enable
Device# configure terminal
Device(config)# no ip dhcp snooping verify no-relay-agent-address
Device(config)# exit
```

ip http access-class

To specify the access list that should be used to restrict access to the HTTP server, use the **ip http access-class** command in global configuration mode. To remove a previously configured access list association, use the **no** form of this command.

```
ip http access-class { access-list-number | ipv4 { access-list-number | access-list-name } | ipv6 access-list-name }
no ip http access-class { access-list-number | ipv4 { access-list-number | access-list-name } | ipv6 access-list-name }
```

Syntax Description

| | |
|---------------------------|--|
| <i>access-list-number</i> | Standard IP access list number in the range 0 to 99, as configured by the access-list global configuration command. |
| ipv4 | Specifies the IPv4 access list to restrict access to the secure HTTP server. |
| <i>access-list-name</i> | Name of a standard IPv4 access list, as configured by the ip access-list command. |
| ipv6 | Specifies the IPv6 access list to restrict access to the secure HTTP server. |

Command Default

No access list is applied to the HTTP server.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

If this command is configured, the specified access list is assigned to the HTTP server. Before the HTTP server accepts a connection, it checks the access list. If the check fails, the HTTP server does not accept the request for a connection.

Examples

The following example shows how to define an access list as 20 and assign it to the HTTP server:

```
Device> enable
Device(config)# ip access-list standard 20
Device(config-std-nacl)# permit 209.165.202.130 0.0.0.255
Device(config-std-nacl)# permit 209.165.201.1 0.0.255.255
Device(config-std-nacl)# permit 209.165.200.225 0.255.255.255
Device(config-std-nacl)# exit
Device(config)# ip http access-class 20
Device(config-std-nacl)# exit
```

The following example shows how to define an IPv4 named access list as and assign it to the HTTP server.

```
Device> enable
Device(config)# ip access-list standard Internet_filter
Device(config-std-nacl)# permit 1.2.3.4
Device(config-std-nacl)# exit
```

```
Device(config)# ip http access-class ipv4 Internet_filter
Device(config)# exit
```

Related Commands

| Command | Description |
|-----------------------|--|
| ip access-list | Assigns an ID to an access list and enters access list configuration mode. |
| ip http server | Enables the HTTP 1.1 server, including the Cisco web browser user interface. |

ip radius source-interface

To force RADIUS to use the IP address of a specified interface for all outgoing RADIUS packets, use the **ip radius source-interface** command in global configuration mode. To prevent RADIUS from using the IP address of a specified interface for all outgoing RADIUS packets, use the no form of this command.

ip radius source-interface *interface-name* [**vrf** *vrf-name*]
no ip radius source-interface

| Syntax Description | |
|----------------------------|---|
| <i>interface-name</i> | Name of the interface that RADIUS uses for all of its outgoing packets. |
| vrf <i>vrf-name</i> | (Optional) Per virtual route forwarding (VRF) configuration. |

Command Default No default behavior or values.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use this command to set the IP address of an interface to be used as the source address for all outgoing RADIUS packets. The IP address is used as long as the interface is in the *up* state. The RADIUS server can use one IP address entry for every network access client instead of maintaining a list of IP addresses. RADIUS uses the IP address of the interface that it is associated to, regardless of whether the interface is in the *up* or *down* state.

The **ip radius source-interface** command is especially useful in cases where the router has many interfaces and you want to ensure that all RADIUS packets from a particular router have the same IP address.

The specified interface should have a valid IP address and should be in the *up* state for a valid configuration. If the specified interface does not have a valid IP address or is in the *down* state, RADIUS selects a local IP that corresponds to the best possible route to the AAA server. To avoid this, add a valid IP address to the interface or bring the interface to the *up* state.

Use the **vrf** *vrf-name* keyword and argument to configure this command per VRF, which allows multiple disjointed routing or forwarding tables, where the routes of one user have no correlation with the routes of another user.

Examples

The following example shows how to configure RADIUS to use the IP address of interface s2 for all outgoing RADIUS packets:

```
ip radius source-interface s2
```

The following example shows how to configure RADIUS to use the IP address of interface Ethernet0 for VRF definition:

```
ip radius source-interface Ethernet0 vrf vrf1
```

ip source binding

To add a static IP source binding entry, use the **ip source binding** command. Use the **no** form of this command to delete a static IP source binding entry

ip source binding *mac-address* **vlan** *vlan-id* *ip-address* **interface** *interface-id*
no ip source binding *mac-address* **vlan** *vlan-id* *ip-address* **interface** *interface-id*

| | | |
|---------------------------|---------------------------------------|---|
| Syntax Description | <i>mac-address</i> | Binding MAC address. |
| | vlan <i>vlan-id</i> | Specifies the Layer 2 VLAN identification; valid values are from 1 to 4094. |
| | <i>ip-address</i> | Binding IP address. |
| | interface <i>interface-id</i> | ID of the physical interface. |
| Command Default | No IP source bindings are configured. | |
| Command Modes | Global configuration (config) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

You can use this command to add a static IP source binding entry only.

The **no** format deletes the corresponding IP source binding entry. It requires the exact match of all required parameter in order for the deletion to be successful. Note that each static IP binding entry is keyed by a MAC address and a VLAN number. If the command contains the existing MAC address and VLAN number, the existing binding entry is updated with the new parameters instead of creating a separate binding entry.

This example shows how to add a static IP source binding entry:

```
Device> enable
Device# configure terminal
Device(config) ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface
gigabitethernet1/0/1
Device(config)# exit
```

ip ssh source-interface

To specify the IP address of an interface as the source address for a Secure Shell (SSH) client device, use the **ip ssh source-interface** command in global configuration mode. To remove the IP address as the source address, use the **no** form of this command.

```
ip ssh source-interface interface
no ip ssh source-interface interface
```

| | | |
|---------------------------|------------------|---|
| Syntax Description | <i>interface</i> | The interface whose address is used as the source address for the SSH client. |
|---------------------------|------------------|---|

Command Default The address of the closest interface to the destination is used as the source address (the closest interface is the output interface through which the SSH packet is sent).

Command Modes Global configuration (config)

| Command History | Release | Modification |
|------------------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.11.1 | |

Usage Guidelines By specifying this command, you can force the SSH client to use the IP address of the source interface as the source address.

Examples In the following example, the IP address assigned to GigabitEthernet interface 1/0/1 is used as the source address for the SSH client:

```
Device> enable
Device# configure terminal
Device(config)# ip ssh source-interface GigabitEthernet 1/0/1
Device(config)# exit
```

ip verify source

To enable IP source guard on an interface, use the **ip verify source** command in interface configuration mode. To disable IP source guard, use the **no** form of this command.

ip verify source [**mac-check**] [**tracking**]
no ip verify source

| | |
|------------------|--|
| mac-check | (Optional) Enables IP source guard with MAC address verification. |
| tracking | (Optional) Enables IP port security to learn static IP address learning on a port. |

Command Default IP source guard is disabled.

Command Modes Interface configuration (config-if)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines To enable IP source guard with source IP address filtering, use the **ip verify source** interface configuration command.

To enable IP source guard with source IP address filtering and MAC address verification, use the **ip verify source mac-check** interface configuration command.

Examples

This example shows how to enable IP source guard with source IP address filtering on an interface:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip verify source
Device(config-if)# end
```

This example shows how to enable IP source guard with MAC address verification:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip verify source mac-check
Device(config-if)# end
```

You can verify your settings by entering the **show ip verify source** command.

ipv6 access-list

To define an IPv6 access list and to place the device in IPv6 access list configuration mode, use the **ipv6 access-list** command in global configuration mode. To remove the access list, use the **no** form of this command.

```

ipv6 access-list { access-list-name | fqdn access-list-name | match-local-traffic | log-update threshold
threshold-in-msgs | role-based access-list-name }
no ipv6 access-list { access-list-name | fqdn access-list-name | match-local-traffic | log-update
threshold threshold-in-msgs | role-based access-list-name }

```

| Syntax Description | | |
|---|--|---|
| <i>access-list-name</i> | | Name of the IPv6 access list. Names cannot contain a space or quotation mark, and must begin with an alphabetic character. The allowed length is 64 characters. |
| fqdn <i>access-list-name</i> | | Specifies an FQDN IPv6 access list. |
| match-local-traffic | | Enables matching for locally-generated traffic. |
| log-update threshold <i>threshold-in-msgs</i> | | Determines how syslog messages are generated after the initial packet match. <ul style="list-style-type: none"> <i>threshold-in-msgs</i>: Number of packets generated. |
| role-based <i>access-list-name</i> | | Creates a role-based IPv6 ACL. |

Command Default No IPv6 access list is defined.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-------------------------------|--|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Bengaluru 17.6.1 | This command was modified. The fqdn keyword was introduced. |

Usage Guidelines From IPv6 access list configuration mode, permit and deny conditions can be set for the defined IPv6 ACL.

Note IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and an IPv6 ACL cannot share the same name.

IPv6 is automatically configured as the protocol type in **permit any any** and **deny any any** statements that are translated from global configuration mode to IPv6 access list configuration mode.

Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. (The first two match conditions allow for ICMPv6 neighbor discovery.) An IPv6 ACL must contain at least one entry for the implicit **deny ipv6 any any** statement to take effect. The IPv6 neighbor discovery process makes use of the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface.

In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, makes use of a separate data link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. Use the **ipv6 access-class** line configuration command with the *access-list-name* argument to apply an IPv6 ACL to incoming and outgoing IPv6 virtual terminal connections to and from the device.

An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded—not originated from—by the device.

Examples

The following example shows how to configure an IPv6 ACL list named list1, and place the device in IPv6 access list configuration mode:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 access-list list1
Device(config-ipv6-acl)# end
```

The following example shows how to configure an IPv6 ACL named list2 and applies the ACL to outbound traffic on Ethernet interface 0. Specifically, the first ACL entry keeps all the packets from the network FEC0:0:0:2::/64 (packets that have the site-local prefix FEC0:0:0:2 as the first 64 bits of their source IPv6 address) from exiting from Gigabit Ethernet interface 0/1/2. The second entry in the ACL permits all other traffic to exit from Ethernet interface 0. The second entry is necessary because an implicit deny all condition is at the end of each IPv6 ACL.

```
Device> enable
Device# configure terminal
Device(config)# ipv6 access-list list2 deny FEC0:0:0:2::/64 any
Device(config)# ipv6 access-list list2 permit any any
Device(config)# interface gigabitethernet 0/1/2
Device(config-if)# ipv6 traffic-filter list2 out
Device(config-if)# end
```

The following example shows how to configure an IPv6 FQDN access list using a name, along with ACL entries and domain names:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 access-list fqdn facl
Device(config-ipv6-fqdn-acl)# sequence 10 permit ipv6 host 2001:DB8::1 host dynamic
www.example1.com
Device(config-ipv6-fqdn-acl)# sequence 20 permit tcp 2001:2:2::2/64 eq ftp host dynamic
www.example2.com log
Device(config-ipv6-fqdn-acl)# sequence 30 permit udp host dynamic www.example3.com any
sequence
Device(config-ipv6-fqdn-acl)# sequence 40 deny tcp any any eq www
Device(config-ipv6-fqdn-acl)# end
```

ipv6 snooping policy

To configure an IPv6 snooping policy and enter IPv6 snooping configuration mode, use the **ipv6 snooping policy** command in global configuration mode. To delete an IPv6 snooping policy, use the **no** form of this command.

ipv6 snooping policy *snooping-policy*
no ipv6 snooping policy *snooping-policy*

| Syntax Description | <i>snooping-policy</i> User-defined name of the snooping policy. The policy name can be a symbolic string (such as Engineering) or an integer (such as 0). | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | An IPv6 snooping policy is not configured. | | | | |
| Command Modes | Global configuration (config) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines Use the **ipv6 snooping policy** command to create an IPv6 snooping policy. When the **ipv6 snooping policy** command is enabled, the configuration mode changes to IPv6 snooping configuration mode. In this mode, the administrator can configure the following IPv6 first-hop security commands:

- The **device-role** command specifies the role of the device attached to the port.
- The **limit address-count** *maximum* command limits the number of IPv6 addresses allowed to be used on the port.
- The **protocol** command specifies that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP).
- The **security-level** command specifies the level of security enforced.
- The **tracking** command overrides the default tracking policy on a port.
- The **trusted-port** command configures a port to become a trusted port; that is, limited or no verification is performed when messages are received.

This example shows how to configure an IPv6 snooping policy:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# end
```

key chain macsec

To configure a MACsec key chain name on a device interface to fetch a Pre Shared Key (PSK), use the **key chain macsec** command in global configuration mode. To disable it, use the **no** form of this command.

```
key chain name macsec
no key chain name [macsec ]
```

| Syntax Description | <i>name</i> Name of a key chain to be used to get keys. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | Key chain macsec is disabled. | | | | |
| Command Modes | Global configuration (config) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

This example shows how to configure MACsec key chain to fetch a 128-bit Pre Shared Key (PSK):

```
Device> enable
Device# configure terminal
Device(config)# key chain kc1 macsec
Device(config-keychain-macsec)# key 1000
Device(config-keychain-macsec)# cryptographic-algorithm aes-128-cmac
Device(config-keychain-macsec-key)# key-string fb63e0269e2768c49bab8ee9a5c2258f
Device(config-keychain-macsec-key)# end
Device#
```

This example shows how to configure MACsec key chain to fetch a 256-bit Pre Shared Key (PSK):

```
Device> enable
Device# configure terminal
Device(config)# key chain kc1 macsec
Device(config-keychain-macsec)# key 2000
Device(config-keychain-macsec)# cryptographic-algorithm aes-256-cmac
Device(config-keychain-macsec-key)# key-string c865632acb269022447c417504a1b
f5db1c296449b52627ba01f2ba2574c2878
Device(config-keychain-macsec-key)# end
Device#
```

key config-key password-encrypt

To store a type 6 encryption key in private NVRAM, use the **key config-key password-encrypt** command in global configuration mode. To disable the encryption, use the **no** form of this command.

key config-key password-encrypt [*text*]
no key config-key password-encrypt [*text*]

| | | |
|---------------------------|--|-----------------------------------|
| Syntax Description | <p><i>text</i> (Optional) Password or master key.</p> <p>Note We recommended that you do not use the <i>text</i> argument, and instead use interactive mode (using the Enter key after you enter the key config-key password-encrypt command) so that the preshared key is not printed anywhere and, therefore, cannot be seen.</p> | |
| Command Default | Type 6 password encryption key is not stored in private NVRAM. | |
| Command Modes | Global configuration (config) | |
| Command History | <p>Release</p> <p>Cisco IOS XE Everest 16.6.1</p> | Modi This introc |

Usage Guidelines

You can securely store plain text passwords in type 6 format in NVRAM using a CLI. Type 6 passwords are encrypted. Although the encrypted passwords can be seen or retrieved, it is difficult to decrypt them to find out the actual password. Use the **key config-key password-encrypt** command along with the **password encryption aes** command to configure and enable the password (symmetric cipher Advanced Encryption Standard [AES] is used to encrypt the keys). The password (key) configured using the **key config-key password-encrypt** command is the master encryption key that is used to encrypt all other keys in the device.

If you configure the **password encryption aes** command without configuring the **key config-key password-encrypt** command, the following message is displayed at startup or during a nonvolatile generation (NVGEN) process, such as when the **show running-config** or **copy running-config startup-config** commands are configured:

```
"Can not encrypt password. Please configure a configuration-key with 'key config-key'"
```

Changing a Password

If the password (master key) is changed or reencrypted, use the **key config-key password-encrypt** command for the list registry to pass the old key and the new key to the application modules that are using type 6 encryption.

Deleting a Password

If the master key that was configured using the **key config-key password-encrypt** command is deleted from the system, a warning is displayed (and a confirm prompt is issued) stating that all type 6 passwords will become useless. As a security measure, after the passwords are encrypted, they will never be decrypted in the Cisco IOS software. However, passwords can be re-encrypted, as explained in the previous paragraph.

Caution If the password that is configured using the **key config-key password-encrypt** command is lost, it cannot be recovered. We, therefore, recommend that you store the password in a safe location.

Unconfiguring Password Encryption

If you unconfigure password encryption using the **no password encryption aes** command, all the existing type 6 passwords are left unchanged, and as long as the password (master key) that was configured using the **key config-key password-encrypt** command exists, the type 6 passwords will be decrypted as and when required by the application.

Storing Passwords

Because no one can *read* the password (configured using the **key config-key password-encrypt** command), there is no way that the password can be retrieved from the device. Existing management stations cannot *know* what it is unless the stations are enhanced to include this key somewhere, in which case, the password needs to be stored securely within the management system. If configurations are stored using TFTP, the configurations are not standalone, meaning that they cannot be loaded onto a device. Before or after the configurations are loaded onto a device, the password must be manually added (using the **key config-key password-encrypt** command). The password can be manually added to the stored configuration. However we do not recommend this because adding the password manually allows anyone to decrypt all the passwords in that configuration.

Configuring New or Unknown Passwords

If you enter or cut and paste ciphertext that does not match the master key, or if there is no master key, the ciphertext is accepted or saved, but an alert message is displayed:

```
"ciphertext>[for username bar>] is incompatible with the configured master key."
```

If a new master key is configured, all plain keys are encrypted and made type 6 keys. The existing type 6 keys are not encrypted. The existing type 6 keys are left as is.

If the old master key is lost or is unknown, you have the option of deleting the master key using the **no key config-key password-encrypt** command. Deleting the master key causes the existing encrypted passwords to remain encrypted in the device configuration. The passwords cannot be decrypted.

Examples

The following example shows how a type 6 encryption key is stored in NVRAM:

```
Device> enable
Device# configure terminal
Device (config)# key config-key password-encrypt
```

Related Commands

| Command | Description |
|--------------------------------|----------------------------------|
| password encryption aes | Enables a type 6 encrypted presh |

key-server

To configure MKA key-server options, use the **key-server** command in MKA-policy configuration mode. To disable MKA key-server options, use the **no** form of this command.

key-server priority *value*
no key-server priority

| | | |
|---------------------------|------------------------------|---|
| Syntax Description | priority <i>value</i> | Specifies the priority value of the MKA key-server. |
|---------------------------|------------------------------|---|

| | |
|------------------------|-----------------------------|
| Command Default | MKA key-server is disabled. |
|------------------------|-----------------------------|

| | |
|----------------------|--|
| Command Modes | MKA-policy configuration (config-mka-policy) |
|----------------------|--|

| | | |
|------------------------|-----------------------------|------------------------------|
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following example shows how to configure the MKA key-server:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# key-server priority 33
```

| | | |
|-------------------------------|---|--|
| Related Commands | Command | Description |
| | mka policy | Configures an MKA policy. |
| | confidentiality-offset | Sets the confidentiality offset for MACsec operations. |
| | delay-protection | Configures MKA to use delay protection in sending MKPDU. |
| | include-icv-indicator | Includes ICV indicator in MKPDU. |
| | macsec-cipher-suite | Configures cipher suite for deriving SAK) |
| | sak-rekey | Configures the SAK rekey interval. |
| | send-secure-announcements | Configures MKA to send secure announcements in sending MKPDUs. |
| | ssci-based-on-sci | Computes SSCI based on the SCI. |
| use-updated-eth-header | Uses the updated Ethernet header for ICV calculation. | |

limit address-count

To limit the number of IPv6 addresses allowed to be used on the port, use the **limit address-count** command in Neighbor Discovery Protocol (NDP) inspection policy configuration mode or IPv6 snooping configuration mode. To return to the default, use the **no** form of this command.

limit address-count *maximum*
no limit address-count

| | |
|---------------------------|---|
| Syntax Description | <i>maximum</i> The number of addresses allowed on the port. The range is from 1 to 10000. |
|---------------------------|---|

| | |
|------------------------|--------------------------|
| Command Default | The default is no limit. |
|------------------------|--------------------------|

| | |
|----------------------|---|
| Command Modes | IPv6 snooping configuration (config-ipv6-snooping) ND inspection policy configuration (config-nd-inspection) |
|----------------------|---|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | The limit address-count command limits the number of IPv6 addresses allowed to be used on the port on which the policy is applied. Limiting the number of IPv6 addresses on a port helps limit the binding table size. The range is from 1 to 10000. |
|-------------------------|---|

This example shows how to define an NDP policy name as policy1, and limit the number of IPv6 addresses allowed on the port to 25:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 nd inspection policy policy1
Device(config-nd-inspection)# limit address-count 25
Device(config-nd-inspection)# end
```

This example shows how to define an IPv6 snooping policy name as policy1, and limit the number of IPv6 addresses allowed on the port to 25:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# limit address-count 25
Device(config-ipv6-snooping)# end
```

mab logging verbose

To filter detailed information from MAC authentication bypass (MAB) system messages, use the **mab logging verbose** command in global configuration mode. Use the no form of this command to disable logging MAB system messages.

mab logging verbose
no mab logging verbose

Syntax Description This command has no arguments or keywords.

Command Default Detailed logging of system messages is not enabled.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command filters details, such as anticipated success, from MAC authentication bypass (MAB) system messages. Failure messages are not filtered.

To filter verbose MAB system messages:

```
Device> enable
Device# configure terminal
Device(config)# mab logging verbose
Device(config)# exit
```

You can verify your settings by entering the **show running-config** command.

| Related Commands | Command | Description |
|------------------|---------------------------------------|--|
| | authentication logging verbose | Filters details from authentication system messages. |
| | dot1x logging verbose | Filters details from 802.1x system messages. |
| | mab logging verbose | Filters details from MAC authentication bypass (MAB) system me |

mab request format attribute 32

To enable VLAN ID-based MAC authentication on a device, use the **mab request format attribute 32 vlan access-vlan** command in global configuration mode. To return to the default setting, use the **no** form of this command.

mab request format attribute 32 vlan access-vlan
no mab request format attribute 32 vlan access-vlan

Syntax Description This command has no arguments or keywords

Command Default VLAN-ID based MAC authentication is disabled.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use this command to allow a RADIUS server to authenticate a new user based on the host MAC address and VLAN. Use this feature on networks with the Microsoft IAS RADIUS server. The Cisco ACS ignores this command.

This example shows how to enable VLAN-ID based MAC authentication on a device:

```
Device> enable
Device# configure terminal
Device(config)# mab request format attribute 32 vlan access-vlan
Device(config)# exit
```

Related Commands

| Command | Description |
|------------------------------------|--|
| authentication event | Sets the action for specific authentication events. |
| authentication fallback | Configures a port to use web authentication as a fallback method that do not support IEEE 802.1x authentication. |
| authentication host-mode | Sets the authorization manager mode on a port. |
| authentication open | Enables or disables open access on a port. |
| authentication order | Sets the order of authentication methods used on a port. |
| authentication periodic | Enables or disables reauthentication on a port. |
| authentication port-control | Enables manual control of the port authorization state. |
| authentication priority | Adds an authentication method to the port-priority list. |
| authentication timer | Configures the timeout and reauthentication parameters for an 802.1x-enabled port. |

| Command | Description |
|---------------------------------|---|
| authentication violation | Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port with the maximum number of devices already connected to that port. |
| mab | Enables MAC-based authentication on a port. |
| mab eap | Configures a port to use the Extensible Authentication Protocol. |
| show authentication | Displays information about authentication manager events on a port. |

macsec-cipher-suite

To configure cipher suite for deriving Security Association Key (SAK), use the **macsec-cipher-suite** command in MKA-policy configuration mode. To disable cipher suite for SAK, use the **no** form of this command.

```
macsec-cipher-suite {gcm-aes-128 | gcm-aes-256 }
no macsec-cipher-suite {gcm-aes-128 | gcm-aes-256 }
```

Syntax Description

gcm-aes-128 Configures cipher suite for deriving SAK with 128-bit encryption.

gcm-aes-256 Configures cipher suite for deriving SAK with 256-bit encryption.

Command Default

GCM-AES-128 encryption is enabled.

Command Modes

MKA-policy configuration (config-mka-policy)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

If the device supports both GCM-AES-128 and GCM-AES-256 ciphers, it is highly recommended to define and use a user-defined MKA policy to include both or only 256 bits cipher, based on your requirements..

Examples

The following example shows how to configure MACsec cipher suite for deriving SAK with 256-bit encryption:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# macsec-cipher-suite gcm-aes-256
```

Related Commands

| Command | Description |
|----------------------------------|--|
| mka policy | Configures an MKA policy. |
| confidentiality-offset | Sets the confidentiality offset for MACsec operations. |
| delay-protection | Configures MKA to use delay protection in sending MKPDU. |
| include-icv-indicator | Includes ICV indicator in MKPDU. |
| key-server | Configures MKA key-server options. |
| sak-rekey | Configures the SAK rekey interval. |
| send-secure-announcements | Configures MKA to send secure announcements in sending MKPDUs. |
| ssci-based-on-sci | Computes SSCI based on the SCI. |

| Command | Description |
|-------------------------------|---|
| use-updated-eth-header | Uses the updated Ethernet header for ICV calculation. |

macsec access-control

To control the behavior of unencrypted packets, use the **macsec access-control** command in interface configuration mode. To disable it, use the **no** form of this command.

macsec access-control { **must-secure** | **should-secure** }

no macsec access-control { **must-secure** | **should-secure** }

Syntax Description

must-secure Does not allow unencrypted packets from physical interfaces or subinterfaces to be transmitted or received. All such packets are dropped, except for MACsec Key Agreement (MKA) control packets. This is the default option.

should-secure Allows unencrypted packets from the physical interfaces or subinterfaces to be transmitted or received.

Command Default

The **must-secure** option is enabled.

Command Modes

Interface configuration (config-if)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Cupertino 17.7.1 | This command was introduced. |

Usage Guidelines

The **must-secure** option is enabled by default for MACsec on subinterfaces when the **macsec** command is configured on an interface.

The **should-secure** option can be configured only at the interface level and not the subinterface level. If MACsec is enabled only on selected subinterfaces, configure the **should-secure** option on the corresponding interface. Configuring the **should-secure** option allows unencrypted traffic on a secured MACsec session. For non-MACsec subinterfaces, you must configure the **should-secure** option for traffic to pass.

Examples

The following example shows how to configure the **should-secure** MACsec access control option:

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/1
Device(config-if)# macsec access-control should-secure
Device(config-if)# end
```

macsec network-link

To enable MACsec Key Agreement protocol (MKA) configuration on the uplink interfaces, use the **macsec network-link** command in interface configuration mode. To disable it, use the **no** form of this command.

macsec network-link

no macsec network-link

| Syntax Description | macsec network-link Enables MKA MACsec configuration on device interfaces using EAP-TLS authentication protocol. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | MACsec network-link is disabled. | | | | |
| Command Modes | Interface configuration (config-if) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

This example shows how to configure MACsec MKA on an interface using the EAP-TLS authentication protocol:

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/20
Device(config-if)# macsec network-link
Device(config-if)# end
Device#
```

match (access-map configuration)

To set the VLAN map to match packets against one or more access lists, use the **match** command in access-map configuration mode. To remove the match parameters, use the **no** form of this command.

```
match {ip address {namenumber} [{namenumber}] [{namenumber}]... | ipv6 address {namenumber}
[{namenumber}] [{namenumber}]... | mac address {name} [{name}] [{name}]... }
no match {ip address {namenumber} [{namenumber}] [{namenumber}]... | ipv6 address
{namenumber} [{namenumber}] [{namenumber}]... | mac address {name} [{name}] [{name}]... }
```

| Syntax Description | |
|---------------------|--|
| ip address | Sets the access map to match packets against an IP address access list. |
| ipv6 address | Sets the access map to match packets against an IPv6 address access list. |
| mac address | Sets the access map to match packets against a MAC address access list. |
| <i>name</i> | Name of the access list to match packets against. |
| <i>number</i> | Number of the access list to match packets against. This option is not valid for MAC access lists. |

Command Default The default action is to have no match parameters applied to a VLAN map.

Command Modes Access-map configuration (config-access-map)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines You enter access-map configuration mode by using the **vlan access-map** global configuration command.

You must enter one access list name or number; others are optional. You can match packets against one or more access lists. Matching any of the lists counts as a match of the entry.

In access-map configuration mode, use the **match** command to define the match conditions for a VLAN map applied to a VLAN. Use the **action** command to set the action that occurs when the packet matches the conditions.

Packets are matched only against access lists of the same protocol type; IP packets are matched against IP access lists, IPv6 packets are matched against IPv6 access lists, and all other packets are matched against MAC access lists.

IP, IPv6, and MAC addresses can be specified for the same map entry.

Examples

This example shows how to define and apply a VLAN access map vmap4 to VLANs 5 and 6 that will cause the interface to drop an IP packet if the packet matches the conditions defined in access list al2:

```
Device> enable
Device(config)# vlan access-map vmap4
Device(config-access-map)# match ip address al2
Device(config-access-map)# action drop
```

```
Device(config-access-map)# exit  
Device(config)# vlan filter vmap4 vlan-list 5-6  
Device(config)# exit
```

You can verify your settings by entering the **show vlan access-map** command.

mka pre-shared-key

To configure MACsec Key Agreement (MKA) MACsec on a device interface using a Pre Shared Key (PSK), use the **mka pre-shared-key** command in interface configuration mode. To disable it, use the **no** form of this command.

```
mka pre-shared-key key-chain key-chain-name [{ fallback key-chain key-chain-name }]
no mka pre-shared-key key-chain key-chain-name [{ fallback key-chain key-chain-name }]
```

| Syntax Description | | |
|---------------------------|--|---|
| key-chain | Enables MACsec MKA configuration on device interfaces using a primary PSK. | |
| fallback key-chain | (Optional) Enables MACsec MKA configuration on device interfaces using a fallback PSK. | |
| <i>key-chain-name</i> | Name of the key chain. | |
| Command Default | MKA pre-shared-key is disabled. | |
| Command Modes | Interface configuration (config-if) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Bengaluru 17.6.2 | The fallback key-chain keyword was introduced. |

Usage Guidelines When **fallback key-chain** is configured under an interface that is MACsec capable, both the primary and fallback key chains will be associated with the interface.

This example shows how to configure MKA MACsec on an interface using a primary PSK:

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/20
Device(config-if)# mka pre-shared-key key-chain kc1
Device(config-if)# end
Device#
```

mka suppress syslogs sak-rekey

To suppress MACsec Key Agreement (MKA) secure association key (SAK) rekey messages during logging, use the **mka suppress syslogs sak-rekey** command in global configuration mode. To enable MKA SAK rekey message logging, use the **no** form of this command.

mka suppress syslogs sak-rekey
no mka suppress syslogs sak-rekey

This command has no arguments or keywords.

Command Default All MKA SAK syslog messages are displayed on the console.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|------------------------|-------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.9.1 | This command was introduced. |

Usage Guidelines MKA SAK syslogs are continuously generated at every rekey interval, and when MKA is configured on multiple interfaces, the amount of syslog generated is too high. Use this command to suppress the MKA SAK syslogs.

Example

The following example shows how to suppress MKA SAK syslog logging:

```
Device> enable
Device# configure terminal
Device(config)# mka suppress syslogs sak-rekey
```

password encryption aes

To enable a type 6 encrypted preshared key, use the **password encryption aes** command in global configuration mode. To disable password encryption, use the **no** form of this command.

password encryption aes
no password encryption aes

| | | |
|---------------------------|--|---|
| Syntax Description | This command has no arguments or keywords. | |
| Command Default | Preshared keys are not encrypted. | |
| Command Modes | Global configuration (config) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced in Cisco IOS XE Everest 16.6.1. |

Usage Guidelines

You can securely store plain text passwords in type 6 format in NVRAM using a CLI. Type 6 passwords are encrypted. Although the encrypted passwords can be seen or retrieved, it is difficult to decrypt them to find out the actual password. Use the **key config-key password-encrypt** command along with the **password encryption aes** command to configure and enable the password (symmetric cipher Advanced Encryption Standard [AES] is used to encrypt the keys). The password (key) that is configured using the **key config-key password-encrypt** command is the master encryption key that is used to encrypt all other keys in the router.

If you configure the **password encryption aes** command without configuring the **key config-key password-encrypt** command, the following message is displayed at startup or during a nonvolatile generation (NVGEN) process, such as when the **show running-config** or **copy running-config startup-config** commands are run:

```
"Can not encrypt password. Please configure a configuration-key with 'key config-key'"
```

Changing a Password

If the password (master key) is changed or re-encrypted using the **key config-key password-encrypt** command, the list registry passes the old key and the new key to the application modules that are using type 6 encryption.

Deleting a Password

If the master key that was configured using the **key config-key password-encrypt** command is deleted from the system, a warning is displayed (and a confirm prompt is issued) that states that all type 6 passwords will no longer be applicable. As a security measure, after the passwords are encrypted, they will never be decrypted in the Cisco IOS software. However, passwords can be re-encrypted as explained in the previous paragraph.

Caution If a password that is configured using the **key config-key password-encrypt** command is lost, it cannot be recovered. Therefore, the password should be stored in a safe location.

Unconfiguring Password Encryption

If you unconfigure password encryption using the **no password encryption aes** command, all the existing type 6 passwords are left unchanged. As long as the password (master key) that was configured using the **key config-key password-encrypt** command exists, the type 6 passwords are decrypted as and when required by the application.

Storing Passwords

Because no one can *read* the password (configured using the **key config-key password-encrypt** command), there is no way that the password can be retrieved from the router. Existing management stations cannot *know* what it is unless the stations are enhanced to include this key somewhere. Therefore, the password needs to be stored securely within the management system. If configurations are stored using TFTP, the configurations are not standalone, meaning that they cannot be loaded onto a router. Before or after the configurations are loaded onto a router, the password must be manually added (using the **key config-key password-encrypt** command). The password can be manually added to the stored configuration, but we do not recommend this because adding the password manually allows anyone to decrypt all the passwords in that configuration.

Configuring New or Unknown Passwords

If you enter or cut and paste ciphertext that does not match the master key, or if there is no master key, the ciphertext is accepted or saved, but the following alert message is displayed:

```
"ciphertext>[for username bar>] is incompatible with the configured master key."
```

If a new master key is configured, all the plain keys are encrypted and converted to type 6 keys. The existing type 6 keys are not encrypted. The existing type 6 keys are left as is.

If the old master key is lost or unknown, you have the option of deleting the master key using the **no key config-key password-encrypt** command. This causes the existing encrypted passwords to remain encrypted in the router configuration. The passwords will not be decrypted.

Examples

The following example shows how a type 6 encrypted preshared key is enabled:

```
Device> enable
Device# configure terminal
Device (config)# password encryption aes
```

Related Commands

| Command | Description |
|--|--------------------------------|
| key config-key password-encrypt | Stores a type 6 encryption key |

permit (MAC access-list configuration)

To allow non-IP traffic to be forwarded if the conditions are matched, use the **permit** command in MAC access-list configuration mode. To remove a permit condition from the extended MAC access list, use the **no** form of this command.

```
{permit {any | hostsrc-MAC-addr | src-MAC-addr mask} {any | hostdst-MAC-addr |
dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv |
diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsaplsap mask | mop-console
| mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp] [coscos]
nopermit {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv |
diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console
| mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp] [coscos]
```

Syntax Description

| | |
|--|--|
| any | Denies any source or destination MAC address. |
| host <i>src-MAC-addr</i> <i>src-MAC-addr mask</i> | Specifies a host MAC address and optional subnet mask. If the defined address, non-IP traffic from that address is denied. |
| host <i>dst-MAC-addr</i> <i>dst-MAC-addr mask</i> | Specifies a destination MAC address and optional subnet mask. If the defined address matches the defined address, non-IP traffic to that address is denied. |
| <i>type mask</i> | (Optional) Specifies the EtherType number of a packet to identify the protocol of the packet. <ul style="list-style-type: none"> • <i>type</i> is 0 to 65535, specified in hexadecimal. • <i>mask</i> is a mask of don't care bits applied to the EtherType. |
| aarp | (Optional) Specifies EtherType AppleTalk Address Resolution Protocol to a network address. |
| amber | (Optional) Specifies EtherType DEC-Amber. |
| appletalk | (Optional) Specifies EtherType AppleTalk/EtherTalk. |
| dec-spanning | (Optional) Specifies EtherType Digital Equipment Corporation Spanning Tree Protocol. |
| decnet-iv | (Optional) Specifies EtherType DECnet Phase IV protocol. |
| diagnostic | (Optional) Specifies EtherType DEC-Diagnostic. |
| dsm | (Optional) Specifies EtherType DEC-DSM. |
| etype-6000 | (Optional) Specifies EtherType 0x6000. |
| etype-8042 | (Optional) Specifies EtherType 0x8042. |
| lat | (Optional) Specifies EtherType DEC-LAT. |
| lavc-sca | (Optional) Specifies EtherType DEC-LAVC-SCA. |

| | |
|-------------------------------------|---|
| lsap <i>lsap-number mask</i> | (Optional) Specifies the LSAP number (0 to 65535) of the protocol of the packet. The <i>mask</i> is a mask of don't care bits applied to the L |
| mop-console | (Optional) Specifies EtherType DEC-MOP Remote C |
| mop-dump | (Optional) Specifies EtherType DEC-MOP Dump. |
| msdos | (Optional) Specifies EtherType DEC-MSDOS. |
| mumps | (Optional) Specifies EtherType DEC-MUMPS. |
| netbios | (Optional) Specifies EtherType DEC- Network Basic |
| vines-echo | (Optional) Specifies EtherType Virtual Integrated Netw |
| vines-ip | (Optional) Specifies EtherType VINES IP. |
| xns-idp | (Optional) Specifies EtherType Xerox Network System |
| cos <i>cos</i> | (Optional) Specifies an arbitrary class of service (CoS). CoS can be performed only in hardware. A warning r |

Command Default

This command has no defaults. However, the default action for a MAC-named ACL is to deny.

Command Modes

MAC-access list configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Though visible in the command-line help strings, **appletalk** is not supported as a matching condition.

You enter MAC access-list configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **any** or **host** keywords, you must enter an address mask.

After an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

To filter IPX traffic, you use the *type mask* or **lsap lsap mask** keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS XE terminology are listed in the following table.

Table 194: IPX Filtering Criteria

| IPX Encapsulation Type | | Filter Criterion |
|------------------------|-------------|------------------|
| Cisco IOS Name | Novell Name | |
| arpa | Ethernet II | EtherType 0x8137 |

| IPX Encapsulation Type | | Filter Criterion |
|------------------------|----------------|------------------|
| Cisco IOS Name | Novell Name | |
| snap | Ethernet-snap | EtherType 0x8137 |
| sap | Ethernet 802.2 | LSAP 0xE0E0 |
| novell-ether | Ethernet 802.3 | LSAP 0xFFFF |

This example shows how to define the MAC-named extended access list to allow NetBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is allowed.

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended
Device(config-ext-macl)# permit any host 00c0.00a0.03fa netbios
Device(config-ext-macl)# end
```

This example shows how to remove the permit condition from the MAC-named extended access list:

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended
Device(config-ext-macl)# no permit any 00c0.00a0.03fa 0000.0000.0000 netbios
Device(config-ext-macl)# end
```

This example permits all packets with EtherType 0x4321:

```
Device> enable
Device# configure terminal
Device(config)# mac access-list extended
Device(config-ext-macl)# permit any any 0x4321 0
Device(config-ext-macl)# end
```

You can verify your settings by entering the **show access-lists** command.

Related Commands

| Command | Description |
|---------------------------------|---|
| deny | Denies from the MAC non-IP traffic to be fo |
| mac access-list extended | Creates an access list traffic. |

protocol (IPv6 snooping)

s

To specify that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP), or to associate the protocol with an IPv6 prefix list, use the **protocol** command in IPv6 snooping configuration mode. To disable address gleaned with DHCP or NDP, use the **no** form of the command.

```
protocol {dhcp | ndp}
no protocol {dhcp | ndp}
```

| | |
|---------------------------|---|
| Syntax Description | dhcp Specifies that addresses should be gleaned in Dynamic Host Configuration Protocol (DHCP) packets. |
| | ndp Specifies that addresses should be gleaned in Neighbor Discovery Protocol (NDP) packets. |

| | |
|------------------------|--|
| Command Default | Snooping and recovery are attempted using both DHCP and NDP. |
|------------------------|--|

| | |
|----------------------|---|
| Command Modes | IPv6 snooping configuration mode (config-ipv6-snooping) |
|----------------------|---|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | If an address does not match the prefix list associated with DHCP or NDP, then control packets will be dropped and recovery of the binding table entry will not be attempted with that protocol. |
|-------------------------|--|

- Using the **no protocol {dhcp | ndp}** command indicates that a protocol will not be used for snooping or gleaned.
- If the **no protocol dhcp** command is used, DHCP can still be used for binding table recovery.
- Data glean can recover with DHCP and NDP, though destination guard will only recovery through DHCP.

This example shows how to define an IPv6 snooping policy name as policy1, and configure the port to use DHCP to glean addresses:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# protocol dhcp
Device(config-ipv6-snooping)# end
```

radius server

To configure the RADIUS server parameters, including RADIUS accounting and authentication, use the **radius server** command in global configuration mode. Use the **no** form of this command to return to the default settings.

```
radius server name
address {ipv4 | ipv6} ip{address | hostname} auth-port udp-port acct-port udp-port
key string
automate tester username name { idle-time | ignore-acct-port | ignore-auth-port | probe-on }
| retransmit value | timeout seconds
no radius server name
```

Syntax Description

| | |
|---|--|
| address {ipv4 ipv6} <i>ip{address hostname}</i> | Specifies the IP address of the RADIUS server. |
| auth-port <i>udp-port</i> | (Optional) Specifies the UDP port for the RADIUS authentication server. The range is from 0 to 65536. |
| acct-port <i>udp-port</i> | (Optional) Specifies the UDP port for the RADIUS accounting server. The range is from 0 to 65536. |
| key <i>string</i> | (Optional) Specifies the authentication and encryption key for all RADIUS communication between the device and the RADIUS daemon. Note The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in this command. Leading spaces are ignored, but spaces within and at the end of the key are used. If there are spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key. |
| automate tester username | (Optional) Enables automatic server testing of the RADIUS server status. <ul style="list-style-type: none"> • name: Name of the server. • idle-time: Specifies the idle time after which server state should be verified. The range is 1 to 35791 minutes, and the default is 60 minutes. • ignore-acct-port: Specifies that the testing should not be performed on the accounting ports of the servers. • ignore-auth-port: Specifies that the testing should not be performed on the authentication port of the servers. • probe-on: Sends a packet to verify the server status. |
| retransmit <i>value</i> | (Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the radius-server retransmit global configuration command setting. |

timeout *seconds* (Optional) Specifies the time interval that the device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the **radius-server timeout** command.

Command Default

- The UDP port for the RADIUS accounting server is 1646.
- The UDP port for the RADIUS authentication server is 1645.
- Automatic server testing is disabled.
- The timeout value is 60 minutes (1 hour).
- When automatic testing is enabled, testing occurs on the accounting and authentication UDP ports.
- The authentication and encryption key (string) is not configured.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Dublin 17.10.1 | The probe-on keyword was introduced. |

Usage Guidelines

- We recommend that you configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.
- You can configure the authentication and encryption key by using the **key string** command in RADIUS server configuration mode. Always configure the key as the last item in this command.
- Use the **automate-tester username name** keyword to enable automatic server testing of the RADIUS server status and to specify the username to be used.

Use the **probe-on** keyword to verify the status of a server by sending RADIUS packets. After this keyword is configured, a five-second dead timer is started and a RADIUS packet is sent to the external RADIUS server after five seconds. The server state is updated if there is a response from the external RADIUS server. If there is no response, the packets are sent out according to the timeout interval that is configured using the **radius-server timeout** command. This will continue for 180 seconds, and if there is still no response, a new dead timer is started, based on the configured **radius-server deadtime** command.

This example shows how to configure 1645 as the UDP port for the authentication server and 1646 as the UDP port for the accounting server, and configure a key string:

```
Device> enable
Device# configure terminal
Device(config)# radius server ISE
Device(config-radius-server)# address ipv4 10.1.1 auth-port 1645 acct-port 1646
Device(config-radius-server)# key cisco123
Device(config-radius-server)# end
```

radius-server dscp

To configure DSCP marking for authentication and accounting on RADIUS servers, use the **radius-server** command. To disable DSCP marking for authentication and accounting on RADIUS servers, use the **no** form of the command.

```
radius-server dscp { acct dscp_acct_value | auth dscp_auth_value }
```

Syntax Description

acct *dscp_acct_value* Configures RADIUS DSCP marking value for accounting. The valid range is from 1 to 63. The default value is 0.

auth *dscp_auth_value* Configures RADIUS DSCP marking value for authentication. The valid range is from 1 to 63. The default value is 0.

Command Default

The DSCP marking on RADIUS packets is disabled by default.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |

Example

This example shows how to configure DSCP marking for authentication and accounting on RADIUS packets:

```
Device# configure terminal
Device(config)# radius-server dscp auth 10 acct 20
```

radius-server dead-criteria

To force one or both of the criteria, used to mark a RADIUS server as dead, to be the indicated constant, use the **radius-server dead-criteria** command in global configuration mode. To disable the criteria that were set, use the **no** form of this command.

radius-server dead-criteria [**time** *seconds*] [**tries** *number-of-tries*]

no radius-server dead-criteria [{**time** *seconds* | **tries** *number-of-tries*}]

Syntax Description

| | |
|-------------------------------------|---|
| time <i>seconds</i> | <p>(Optional) Minimum amount of time, in seconds, that must elapse from the time that the device last received a valid packet from the RADIUS server to the time the server is marked as dead. If a packet has not been received since the device booted, and there is a timeout, the time criterion will be treated as though it has been met. You can configure the time to be from 1 through 120 seconds.</p> <ul style="list-style-type: none"> If the <i>seconds</i> argument is not configured, the number of seconds will range from 10 to 60 seconds, depending on the transaction rate of the server. <p>Note Both the time criterion and the tries criterion must be met for the server to be marked as dead.</p> |
| tries <i>number-of-tries</i> | <p>(Optional) Number of consecutive timeouts that must occur on the device before the RADIUS server is marked as dead. If the server performs both authentication and accounting, both types of packets will be included in the number. Improperly constructed packets will be counted as though they were timeouts. All transmissions, including the initial transmit and all retransmits, will be counted. You can configure the number of timeouts to be from 1 through 100.</p> <ul style="list-style-type: none"> If the <i>number-of-tries</i> argument is not configured, the number of consecutive timeouts will range from 10 to 100, depending on the transaction rate of the server and the number of configured retransmissions. <p>Note Both the time criterion and the tries criterion must be met for the server to be marked as dead.</p> |

Command Default

The number of seconds and number of consecutive timeouts that occur before the RADIUS server is marked as dead will vary, depending on the transaction rate of the server and the number of configured retransmissions.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Note Both the time criterion and the tries criterion must be met for the server to be marked as dead.

The **no** form of this command has the following cases:

- If neither the *seconds* nor the *number-of-tries* argument is specified with the **no radius-server dead-criteria** command, both time and tries will be reset to their defaults.
- If the *seconds* argument is specified using the originally set value, the time will be reset to the default value range (10 to 60).
- If the *number-of-tries* argument is specified using the originally set value, the number of tries will be reset to the default value range (10 to 100).

Examples

The following example shows how to configure the device so that it will be considered dead after 5 seconds and 4 tries:

```
Device> enable
Device# configure terminal
Device(config)# radius-server dead-criteria time 5 tries 4
```

The following example shows how to disable the time and number-of-tries criteria that were set for the **radius-server dead-criteria** command.

```
Device(config)# no radius-server dead-criteria
```

The following example shows how to disable the time criterion that was set for the **radius-server dead-criteria** command.

```
Device(config)# no radius-server dead-criteria time 5
```

The following example shows how to disable the number-of-tries criterion that was set for the **radius-server dead-criteria** command.

```
Device(config)# no radius-server dead-criteria tries 4
```

Related Commands

| Command | Description |
|---|---|
| debug aaa dead-criteria transactions | Displays AAA dead-criteria transaction values. |
| show aaa dead-criteria | Displays dead-criteria information for a AAA server. |
| show aaa server-private | Displays the status of all private RADIUS servers. |
| show aaa servers | Displays information about the number of packets sent to and received from AAA servers. |

radius-server deadline

To improve RADIUS response time when some servers might be unavailable and to skip unavailable servers immediately, use the **radius-server deadline** command in global configuration mode. To set deadline to 0, use the **no** form of this command.

radius-server deadline *minutes*
no radius-server deadline

| | | |
|---------------------------|----------------|--|
| Syntax Description | <i>minutes</i> | Length of time, in minutes (up to a maximum of 1440 minutes or 24 hours), for which a RADIUS server is skipped over by transaction requests. |
|---------------------------|----------------|--|

Command Default Dead time is set to 0.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use this command to enable the Cisco IOS software to mark as *dead* any RADIUS servers that fail to respond to authentication requests, thus avoiding the wait for the request to time out before trying the next configured server. A RADIUS server marked as *dead* is skipped by additional requests for the specified duration (in minutes) or unless there are no servers not marked as *dead*.

Note If a RADIUS server that is marked as *dead* receives a directed-request, the directed-request is not omitted by the RADIUS server. The RADIUS server continues to process the directed-request because the request is directly sent to the RADIUS server.

The RADIUS server will be marked as dead if both of the following conditions are met:

1. A valid response has not been received from the RADIUS server for any outstanding transaction for at least the timeout period that is used to determine whether to retransmit to that server, and
2. At least the requisite number of retransmits plus one (for the initial transmission) have been sent consecutively across all transactions being sent to the RADIUS server without receiving a valid response from the server within the requisite timeout.

Examples

The following example specifies five minutes of deadline for RADIUS servers that fail to respond to authentication requests:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# radius-server deadline 5
```

Related Commands

| Command | Description |
|--|--|
| deadtime (server-group configuration) | Configures deadtime within the context of RADIUS server groups. |
| radius-server host | Specifies a RADIUS server host. |
| radius-server retransmit | Specifies the number of times that the Cisco IOS software searches the list of RADIUS server hosts before giving up. |
| radius-server timeout | Sets the interval for which a device waits for a server host to reply. |

radius-server directed-request

To allow users to log in to a Cisco network access server (NAS) and select a RADIUS server for authentication, use the **radius-server directed-request** command in global configuration mode. To disable the directed-request function, use the **no** form of this command.

```
radius-server directed-request [restricted]
no radius-server directed-request [restricted]
```

| | |
|---------------------------|--|
| Syntax Description | restricted (Optional) Prevents the user from being sent to a secondary server if the specified server is not available. |
|---------------------------|--|

Command Default The User cannot log in to a Cisco NAS and select a RADIUS server for authentication.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **radius-server directed-request** command sends only the portion of the username before the “@” symbol to the host specified after the “@” symbol. In other words, with this command enabled, you can direct a request to any of the configured servers, and only the username is sent to the specified server.

Note If a private RADIUS server is used as the group server by configuring the **server-private** (RADIUS) command, then the **radius-server directed-request** command cannot be configured.

The following is the sequence of events to send a message to RADIUS servers:

- If the **radius-server directed-request** command is configured:
 - A request is sent to the directed server. If there are more servers with the same IP address, the request is sent only to the first server with same IP address.
 - If a response is not received, requests will be sent to all servers listed in the first method list.
 - If no response is received with the first method, the request is sent to all servers listed in the second method list until the end of the method list is reached.

Note To select the directed server, search the first server group in the method list for a server with the IP address provided in a directed request. If it is not available, the first server group with the same IP address from the global pool is considered.

- If the **radius-server directed-request restricted** command is configured for every server group in the method list, until the response is received from the directed server or the end of method list is reached, the following actions occur:
 - The first server with an IP address of the directed server will be used to send the request.
 - If a server with the same IP address is not found in the server group, then the first server in the global pool with the IP address of the directed-server will be used.

If the **radius-server directed-request** command is disabled using the **no radius-server directed-request** command, the entire string, both before and after the “@” symbol, is sent to the default RADIUS server. The router queries the list of servers, starting with the first one in the list. It sends the whole string, and accepts the first response from the server.

Use the **radius-server directed-request restricted** command to limit the user to the RADIUS server identified as part of the username.

If the user request has a server IP address, then the directed server forwards it to a specific server before forwarding it to the group. For example, if a user request such as user@10.0.0.1 is sent to the directed server, and if the IP address specified in this user request is the IP address of a server, the directed server forwards the user request to the specific server.

If a directed server is configured both on the server group and on the host server, and if the user request with the configured server name is sent to the directed server, the directed server forwards the user request to the host server before forwarding it to the server group. For example, if a user request of user@10.0.0.1 is sent to the directed server and 10.0.0.1 is the host server address, then the directed server forwards the user request to the host server before forwarding the request to the server group.

Note When the **no radius-server directed-request restricted** command is entered, only the restricted flag is removed, and the directed-request flag is retained. To disable the directed-request function, you must also enter the **no radius-server directed-request** command.

Examples

The following example shows how to configure the directed-request function:

```
Device> enable
Device# configure terminal
Device(config)# radius server rad-1
Device(config-radius-server)# address ipv4 10.1.1.2
Device(config-radius-server)# key dummy123
Device(config-radius-server)# exit
Device(config)# radius-server directed-request
```

Related Commands

| Command | Description |
|--------------------------------|--|
| aaa group server | Groups different server hosts into distinct lists and distinct methods. |
| aaa new-model | Enables the AAA access control model. |
| server-private (RADIUS) | Configures the IP address of the private RADIUS server for the group server. |

radius-server domain-stripping

To configure a network access server (NAS) to strip suffixes, or to strip both suffixes and prefixes from the username before forwarding the username to the remote RADIUS server, use the **radius-server domain-stripping** command in global configuration mode. To disable a stripping configuration, use the **no** form of this command.

Note The **ip vrf default** command must be configured in global configuration mode before the **radius-server domain-stripping** command is configured to ensure that the default VRF name is a NULL value until the default vrf name is configured.

```
radius-server domain-stripping [{ [right-to-left] [prefix-delimiter character [character2
. . . character7]] [delimiter character [character2 . . . character7]] | strip-suffix
suffix }] [vrf vrf-name]
no radius-server domain-stripping [{ [right-to-left] [prefix-delimiter character [character2
. . . character7]] [delimiter character [character2 . . . character7]] | strip-suffix
suffix }] [vrf vrf-name]
```

Syntax Description

| | |
|---|--|
| right-to-left | (Optional) Specifies that the NAS will apply the stripping configuration at the first delimiter found when parsing the full username from right to left. The default is for the NAS to apply the stripping configuration at the first delimiter found when parsing the full username from left to right. |
| prefix-delimiter <i>character</i> [<i>character2...character7</i>] | (Optional) Enables prefix stripping and specifies the character or characters that will be recognized as a prefix delimiter. Valid values for the <i>character</i> argument are @, /, \$, %, \, #, and -. Multiple characters can be entered without intervening spaces. Up to seven characters can be defined as prefix delimiters, which is the maximum number of valid characters. If a \ is entered as the final or only value for the <i>character</i> argument, it must be entered as \\. No prefix delimiter is defined by default. |
| delimiter <i>character</i> [<i>character2...character7</i>] | (Optional) Specifies the character or characters that will be recognized as a suffix delimiter. Valid values for the <i>character</i> argument are @, /, \$, %, \, #, and -. Multiple characters can be entered without intervening spaces. Up to seven characters can be defined as suffix delimiters, which is the maximum number of valid characters. If a \ is entered as the final or only value for the <i>character</i> argument, it must be entered as \\. The default suffix delimiter is the @ character. |
| strip-suffix <i>suffix</i> | (Optional) Specifies a suffix to strip from the username. |
| vrf <i>vrf-name</i> | (Optional) Restricts the domain stripping configuration to a Virtual Private Network (VPN) routing and forwarding (VRF) instance. The <i>vrf-name</i> argument specifies the name of a VRF. |

Command Default

Stripping is disabled. The full username is sent to the RADIUS server.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **radius-server domain-stripping** command to configure the NAS to strip the domain from a username before forwarding the username to the RADIUS server. If the full username is user1@cisco.com, enabling the **radius-server domain-stripping** command results in the username “user1” being forwarded to the RADIUS server.

Use the **right-to-left** keyword to specify that the username should be parsed for a delimiter from right to left, rather than from left to right. This allows strings with two instances of a delimiter to strip the username at either delimiter. For example, if the username is user@cisco.com@cisco.net, the suffix could be stripped in two ways. The default direction (left to right) would result in the username “user” being forwarded to the RADIUS server. Configuring the **right-to-left** keyword would result in the username “user@cisco.com” being forwarded to the RADIUS server.

Use the **prefix-delimiter** keyword to enable prefix stripping and to specify the character or characters that will be recognized as a prefix delimiter. The first configured character that is parsed will be used as the prefix delimiter, and any characters before that delimiter will be stripped.

Use the **delimiter** keyword to specify the character or characters that will be recognized as a suffix delimiter. The first configured character that is parsed will be used as the suffix delimiter, and any characters after that delimiter will be stripped.

Use **strip-suffix** *suffix* to specify a particular suffix to strip from usernames. For example, configuring the **radius-server domain-stripping strip-suffix cisco.net** command would result in the username user@cisco.net being stripped, while the username user@cisco.com will not be stripped. You may configure multiple suffixes for stripping by issuing multiple instances of the **radius-server domain-stripping** command. The default suffix delimiter is the @ character.

Note Issuing the **radius-server domain-stripping strip-suffix** *suffix* command disables the capacity to strip suffixes from all domains. Both the suffix delimiter and the suffix must match for the suffix to be stripped from the full username. The default suffix delimiter of @ will be used if you do not specify a different suffix delimiter or set of suffix delimiters using the **delimiter** keyword.

To apply a domain-stripping configuration only to a specified VRF, use the **vrf** *vrf-name* option.

The interactions between the different types of domain stripping configurations are as follows:

- You may configure only one instance of the **radius-server domain-stripping[**right-to-left** [**prefix-delimiter** *character* [*character2...character7*]] [**delimiter** *character* [*character2...character7*]]** command.
- You may configure multiple instances of the **radius-server domain-stripping[**right-to-left** [**prefix-delimiter** *character* [*character2...character7*]] [**delimiter** *character* [*character2...character7*]] [**vrf** *vrf-name*]** command with unique values for **vrf** *vrf-name*.
- You may configure multiple instances of the **radius-server domain-stripping strip-suffix** *suffix* [**vrf** *per-vrf*] **command to specify multiple suffixes to be stripped as part of a global or per-VRF ruleset.**

- Issuing any version of the **radius-server domain-stripping** command automatically enables suffix stripping using the default delimiter character @ for that ruleset, unless a different delimiter or set of delimiters is specified.
- Configuring a per-suffix stripping rule disables generic suffix stripping for that ruleset. Only suffixes that match the configured suffix or suffixes will be stripped from usernames.

Examples

The following example configures the router to parse the username from right to left and sets the valid suffix delimiter characters as @, \, and \$. If the full username is cisco/user@cisco.com\$cisco.net, the username “cisco/user@cisco.com” will be forwarded to the RADIUS server because the \$ character is the first valid delimiter encountered by the NAS when parsing the username from right to left.

```
radius-server domain-stripping right-to-left delimiter @\ $
```

The following example configures the router to strip the domain name from usernames only for users associated with the VRF instance named abc. The default suffix delimiter @ will be used for generic suffix stripping.

```
radius-server domain-stripping vrf abc
```

The following example enables prefix stripping using the character / as the prefix delimiter. The default suffix delimiter character @ will be used for generic suffix stripping. If the full username is cisco/user@cisco.com, the username “user” will be forwarded to the RADIUS server.

```
radius-server domain-stripping prefix-delimiter /
```

The following example enables prefix stripping, specifies the character / as the prefix delimiter, and specifies the character # as the suffix delimiter. If the full username is cisco/user@cisco.com#cisco.net, the username “user@cisco.com” will be forwarded to the RADIUS server.

```
radius-server domain-stripping prefix-delimiter / delimiter #
```

The following example enables prefix stripping, configures the character / as the prefix delimiter, configures the characters \$, @, and # as suffix delimiters, and configures per-suffix stripping of the suffix cisco.com. If the full username is cisco/user@cisco.com, the username “user” will be forwarded to the RADIUS server. If the full username is cisco/user@cisco.com#cisco.com, the username “user@cisco.com” will be forwarded.

```
radius-server domain-stripping prefix-delimiter / delimiter $@#  
radius-server domain-stripping strip-suffix cisco.com
```

The following example configures the router to parse the username from right to left and enables suffix stripping for usernames with the suffix cisco.com. If the full username is cisco/user@cisco.net@cisco.com, the username “cisco/user@cisco.net” will be forwarded to the RADIUS server. If the full username is cisco/user@cisco.com@cisco.net, the full username will be forwarded.

```
radius-server domain-stripping right-to-left  
radius-server domain-stripping strip-suffix cisco.com
```

The following example configures a set of global stripping rules that will strip the suffix cisco.com using the delimiter @, and a different set of stripping rules for usernames associated with the VRF named myvrf:

```
radius-server domain-stripping strip-suffix cisco.com  
!  
radius-server domain-stripping prefix-delimiter # vrf myvrf  
radius-server domain-stripping strip-suffix cisco.net vrf myvrf
```

Related Commands

| Command | Description |
|---------------------------------------|---|
| aaa new-model | Enables the AAA access control model. |
| ip vrf | Defines a VRF instance and enters VRF configuration mode. |
| tacacs-server domain-stripping | Configures a router to strip a prefix or suffix from the username before forwarding the username to the TACACS+ server. |

sak-rekey

To configure the Security Association Key (SAK) rekey time interval for a defined MKA policy, use the **sak-rekey** command in MKA-policy configuration mode. To stop the SAK rekey timer, use the **no** form of this command.

```
sak-rekey {interval time-interval | on-live-peer-loss}
no sak-rekey {interval | on-live-peer-loss}
```

| Syntax Description | interval | SAK rekey interval in seconds. |
|--------------------|--------------------------|--|
| | <i>time-interval</i> | The range is from 30 to 65535, and the default is 0. |
| | on-live-peer-loss | Peer loss from the live membership. |

Command Default The SAK rekey timer is disabled. The default is 0.

Command Modes MKA-policy configuration (config-mka-policy)

| Command History | Release | Modification |
|-----------------|---------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

Examples

The following example shows how to configure the SAK rekey interval:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# sak-rekey interval 300
```

| Related Commands | Command | Description |
|------------------|----------------------------------|--|
| | mka policy | Configures an MKA policy. |
| | confidentiality-offset | Sets the confidentiality offset for MACsec operations. |
| | delay-protection | Configures MKA to use delay protection in sending MKPDU. |
| | include-icv-indicator | Includes ICV indicator in MKPDU. |
| | key-server | Configures MKA key-server options. |
| | macsec-cipher-suite | Configures cipher suite for deriving SAK. |
| | send-secure-announcements | Configures MKA to send secure announcements in sending MKPDUs. |
| | ssci-based-on-sci | Computes SSCI based on the SCI. |
| | use-updated-eth-header | Uses the updated Ethernet header for ICV calculation. |

security level (IPv6 snooping)

To specify the level of security enforced, use the **security-level** command in IPv6 snooping policy configuration mode.

security level { **glean** | **guard** | **inspect** }

| Syntax Description | glean | Extracts addresses from the messages and installs them into the binding table without performing any verification. |
|--------------------|--|--|
| | guard | Performs both glean and inspect. Additionally, RA, and DHCP server messages are rejected unless they are received on a trusted port or another policy authorizes them. |
| | inspect | Validates messages for consistency and conformance; in particular, address ownership is enforced. Invalid messages are dropped. |
| Command Default | The default security level is guard. | |
| Command Modes | IPv6 snooping configuration (config-ipv6-snooping) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

This example shows how to define an IPv6 snooping policy name as policy1 and configure the security level as inspect:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# security-level inspect
Device(config-ipv6-snooping)# end
```

send-secure-announcements

To enable MKA to send secure announcements in MACsec Key Agreement Protocol Data Units (MKPDUs), use the **send-secure-announcements** command in MKA-policy configuration mode. To disable sending of secure announcements, use the **no** form of this command.

send-secure-announcements
no send-secure-announcements

Syntax Description This command has no arguments or keywords.

Command Default Secure announcements in MKPDUs is disabled.

Command Modes MKA-policy configuration (config-mka-policy)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

Usage Guidelines Secure announcements revalidate the MACsec Cipher Suite capabilities which were shared previously through unsecure announcements.

Examples

The following example shows how to enable sending of secure announcements:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# send-secure-announcements
```

| Related Commands | Command | Description |
|------------------|-------------------------------|--|
| | mka policy | Configures an MKA policy. |
| | confidentiality-offset | Sets the confidentiality offset for MACsec operations. |
| | delay-protection | Configures MKA to use delay protection in sending MKPDU. |
| | include-icv-indicator | Includes ICV indicator in MKPDU. |
| | key-server | Configures MKA key-server options. |
| | macsec-cipher-suite | Configures cipher suite for deriving SAK. |
| | sak-rekey | Configures the SAK rekey interval. |
| | ssci-based-on-sci | Computes SSCI based on the SCI. |
| | use-updated-eth-header | Uses the updated ethernet header for ICV calculation. |

server-private (RADIUS)

To configure the IP address of the private RADIUS server for the group server, use the **server-private** command in RADIUS server-group configuration mode. To remove the associated private server from the authentication, authorization, and accounting (AAA) group server, use the **no** form of this command.

server-private *ip-address* [{**auth-port** *port-number* | **acct-port** *port-number*}] [**non-standard**] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*]

no server-private *ip-address* [{**auth-port** *port-number* | **acct-port** *port-number*}] [**non-standard**] [**timeout** *seconds*] [**retransmit** *retries*] [**key** *string*]

Syntax Description

| | |
|-------------------------------------|---|
| <i>ip-address</i> | IP address of the private RADIUS server host. |
| auth-port <i>port-number</i> | (Optional) User Datagram Protocol (UDP) destination port for authentication requests. The default value is 1645. |
| acct-port <i>port-number</i> | (Optional) UDP destination port for accounting requests. The default value is 1646. |
| non-standard | (Optional) RADIUS server is using vendor-proprietary RADIUS attributes. |
| timeout <i>seconds</i> | (Optional) Time interval (in seconds) that the device waits for the RADIUS server to reply before retransmitting. This setting overrides the global value of the radius-server timeout command. If no timeout value is specified, the global value is used. |
| retransmit <i>retries</i> | (Optional) Number of times a RADIUS request is resent to a server, if that server is not responding or responding slowly. This setting overrides the global setting of the radius-server retransmit command. |
| key <i>string</i> | (Optional) Authentication and encryption key used between the device and the RADIUS daemon running on the RADIUS server. This key overrides the global setting of the radius-server key command. If no key string is specified, the global value is used. The <i>string</i> can be 0 (specifies that an unencrypted key follows), 6 (specifies that an advanced encryption scheme [AES] encrypted key follows), 7 (specifies that a hidden key follows), or a line specifying the unencrypted (clear-text) server key. |

Command Default

If server-private parameters are not specified, global configurations will be used; if global configurations are not specified, default values will be used.

Command Modes

RADIUS server-group configuration (config-sg-radius)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **server-private** command to associate a particular private server with a defined server group. To prevent possible overlapping of private addresses between virtual route forwarding (VRF) instances, private

servers (servers with private addresses) can be defined within the server group and remain hidden from other groups, while the servers in the global pool (default "radius" server group) can still be referred to by IP addresses and port numbers. Thus, the list of servers in server groups includes references to the hosts in the global configuration and the definitions of private servers.

- Note**
- If the **radius-server directed-request** command is configured, then a private RADIUS server cannot be used as the group server by configuring the **server-private (RADIUS)** command.
 - Creating or updating AAA server statistics record for private RADIUS servers are not supported. If private RADIUS servers are used, then error messages and tracebacks will be encountered, but these error messages or tracebacks do not have any impact on the AAA RADIUS functionality. To avoid these error messages and tracebacks, configure public RADIUS server instead of private RADIUS server.

Use the **password encryption aes** command to configure type 6 AES encrypted keys.

Examples

The following example shows how to define the sg_water RADIUS group server and associate private servers with it:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa group server radius sg_water
Device(config-sg-radius)# server-private 10.1.1.1 timeout 5 retransmit 3 key xyz
Device(config-sg-radius)# server-private 10.2.2.2 timeout 5 retransmit 3 key xyz
Device(config-sg-radius)# end
```

Related Commands

| Command | Description |
|---------------------------------------|--|
| aaa group server | Groups different server hosts into distinct lists and distinct methods. |
| aaa new-model | Enables the AAA access control model. |
| password encryption aes | Enables a type 6 encrypted preshared key. |
| radius-server host | Specifies a RADIUS server host. |
| radius-server directed-request | Allows users to log in to a Cisco NAS and select a RADIUS server for authentication. |

server-private (TACACS+)

To configure the IPv4 or IPv6 address of the private TACACS+ server for the group server, use the **server-private** command in server-group configuration mode. To remove the associated private server from the authentication, authorization, and accounting (AAA) group server, use the **no** form of this command.

```
server-private { ipv4-address | ipv6-address | fqdn } [ nat ] [ single-connection ] [ port port-number ] [ timeout seconds ] key [{ 0 | 7 } ] string
no server-private
```

Syntax Description

| | |
|--------------------------|---|
| ipv4-address | IPv4 address of the private TACACS+ server host. |
| ipv6-address | IPv6 address of the private TACACS+ server host. |
| fqdn | Fully qualified domain name (fqdn) of the private TACACS+ server host for address resolution from the Domain Name Server (DNS) |
| nat | (Optional) Specifies the port Network Address Translation (NAT) address of the remote device. This address is sent to the TACACS+ server. |
| single-connection | (Optional) Maintains a single TCP connection between the router and the TACACS+ server. |
| timeout seconds | (Optional) Specifies a timeout value for the server response. This value overrides the global timeout value set with the tacacs-server timeout command for this server only. |
| port port-number | (Optional) Specifies a server port number. This option overrides the default, which is port 49. |
| key [0 7] string | (Optional) Specifies an authentication and encryption key. This key must match the key used by the TACACS+ daemon. Specifying this key overrides the key set by the global tacacs-server key command for this server only. If no number or 0 is entered, the <i>string</i> that is entered is considered to be plain text. If 7 is entered, the <i>string</i> that is entered is considered to be encrypted text. |

Command Default

If server-private parameters are not specified, global configurations will be used; if global configurations are not specified, default values will be used.

Command Modes

TACACS+ server-group configuration (config-sg-tacacs+)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **server-private** command to associate a particular private server with a defined server group. To prevent possible overlapping of private addresses between virtual route forwardings (VRFs), private servers (servers with private addresses) can be defined within the server group and remain hidden from other groups, while the servers in the global pool (default "TACACS+" server group) can still be referred to by IP addresses

and port numbers. Thus, the list of servers in server groups includes references to the hosts in the global configuration and the definitions of private servers.

The following example shows how to define the tacacs1 TACACS+ group server and associate private servers with it:

```
Device> enable
Device# configure terminal
Device(config)# aaa group server tacacs+ tacacs1
Device(config-sg-tacacs+)# server-private 10.1.1.1 port 19 key cisco
Device(config-sg-tacacs+)# exit
Device(config)# ip vrf cisco
Device(config-vrf)# rd 100:1
Device(config-vrf)# exit
Device(config)# interface Loopback0
Device(config-if)# ip address 10.0.0.2 255.0.0.0
Device(config-if)# ip vrf forwarding cisco
```

Related Commands

| Command | Description |
|---|--|
| aaa group server | Groups different server hosts into distinct lists and distinct methods. |
| aaa new-model | Enables the AAA access control model. |
| ip tacacs source-interface | Uses the IP address of a specified interface for all outgoing TACACS+ packets. |
| ip vrf forwarding (server-group) | Configures the VRF reference of an AAA TACACS+ server group. |

show aaa cache group

To display all the cache entries stored by the AAA cache, use the **show aaa cache group** command in privileged EXEC mode.

```
show aaa cache group name { all | profile name }
```

| Syntax Description | |
|----------------------------|---|
| <i>name</i> | Text string representing a cache server group. |
| all | Displays all the server group profile details. |
| profile <i>name</i> | Displays the specified individual server group profile details. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **IOSD AAA Auth Cache entries** section of the command output displays Cisco IOSd-related AAA authentication cache entries that get populated when AAA authentication cache is used as the authentication method for Cisco IOSd use-cases like PPP, login, and so on. The **SMD AAA Auth Cache entries** section of the command output displays SMD AAA authentication cache entries that get populated when AAA authentication cache is being used as the authentication method for session manager daemon (SMD) use cases, such as 802.1x, MAB, and so on. The **show aaa cache group** command displays Cisco IOSd use cases-related AAA authentication cache entries first, followed by SMD use cases-related AAA authentication cache entries.

Examples

The following example shows how to display all the cache entries for a group. The fields are self-explanatory.

```
Device# show aaa cache group radiusGroup all

IOSD AAA Auth Cache entries:
-----
Entries in Profile dB radiusGroup for exact match:
No entries found in Profile dB

SMD AAA Auth Cache entries:
-----
***Total number of AAA Auth cache entries is 3

MAC ADDR: 5C85.7E31.756C
Profile Name: CACHE-PROFILE
User Name: test
Timeout: 86400

MAC ADDR: AABB.CCDD.EE00
Profile Name: CACHE-PROFILE
User Name: cache1
Timeout: 86400
```

```
MAC ADDR: AABB.CCDD.EE01
Profile Name: CACHE-PROFILE
User Name: cache2
Timeout: 86400
```

Related Commands

| Command | Description |
|------------------------------|---|
| clear aaa cache group | Clears individual entries or all the entries in the cache. |
| debug aaa cache group | Debugs the caching mechanism and ensures that entries are cached from AAA server responses, and found when queried. |

show aaa clients

To display authentication, authorization, and accounting (AAA) client statistics, use the **show aaa clients** command.

show aaa clients [**detailed**]

Syntax Description

detailed (Optional) Shows detailed AAA client statistics.

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

This is an example of output from the **show aaa clients** command:

```
Device> enable
Device# show aaa clients

Dropped request packets: 0
```

show aaa command handler

To display authentication, authorization, and accounting (AAA) command handler statistics, use the **show aaa command handler** command.

show aaa command handler

Syntax Description This command has no arguments or keywords.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

This is an example of output from the **show aaa command handler** command:

```
Device# show aaa command handler

AAA Command Handler Statistics:
  account-logon: 0, account-logout: 0
  account-query: 0, pod: 0
  service-logon: 0, service-logout: 0
  user-profile-push: 0, session-state-log: 0
  reauthenticate: 0, bounce-host-port: 0
  disable-host-port: 0, update-rbacl: 0
  update-sgt: 0, update-cts-policies: 0
  invalid commands: 0
  async message not sent: 0
```

show aaa common-criteria policy

To display AAA common criteria security policy details, use the **show aaa common-criteria policy** command in privileged EXEC mode.

```
show aaa common-criteria policy { name policy-name | all }
```

Syntax Description

name *policy-name* Specifies the password security details for a specific policy.

all Specifies the password security details for all the configured policies.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **show aaa common-criteria policy** command to display the security policy details for a specific policy or for all the configured policies.

Examples

The following is a sample output from the **show aaa common-criteria policy** command:

```
Device# show aaa common-criteria policy name policy1

Policy name: policy1
Minimum length: 1
Maximum length: 64
Upper Count: 20
Lower Count: 20
Numeric Count: 5
Special Count: 2
Number of character changes 4
Valid forever. User tied to this policy will not expire.
```

The following is a sample output from the **show aaa common-criteria policy all** command:

```
Device# show aaa common-criteria policy all
=====

Policy name: policy1
Minimum length: 1
Maximum length: 64
Upper Count: 20
Lower Count: 20
Numeric Count: 5
Special Count: 2
Number of character changes 4
Valid forever. User tied to this policy will not expire.
=====

Policy name: policy2
Minimum length: 1
Maximum length: 34
```

```

Upper Count: 10
Lower Count: 5
Numeric Count: 4
Special Count: 2
Number of character changes 4
Valid forever. User tied to this policy will not expire.
=====

```

The following table describes the significant fields shown in the display.

Table 195: show aaa common-criteria policy all Field Descriptions

| Field | Description |
|-----------------------------|---|
| Policy name | Name of the configured security policy. |
| Minimum length | Minimum length of the password. |
| Maximum length | Maximum length of the password. |
| Upper Count | Number of uppercase characters. |
| Lower Count | Number of lowercase characters. |
| Numeric Count | Number of numeric characters. |
| Special Count | Number of special characters. |
| Number of character changes | Number of changed characters between old and new passwords. |

Related Commands

| Command | Description |
|-----------------------------------|---|
| aaa common-criteria policy | Configures an AAA common criteria security policy. |
| debug aaa common-criteria | Enables debugging for the AAA common criteria password security policies. |

show aaa dead-criteria

To display dead-criteria detection information for an authentication, authorization, and accounting (AAA) server, use the **show aaa dead-criteria** command in privileged EXEC mode.

```
show aaa dead-criteria { security-protocol ip-address | server-name } [auth-port port-number]
[acct-port port-number][server-group-name]
```

Syntax Description

| | |
|--------------------------|--|
| security-protocol | Security protocol of the specified AAA server. Currently, the only protocol that is supported is RADIUS. |
| <i>ip-address</i> | IP address of the specified AAA server. |
| <i>server-name</i> | Name of the specified AAA server. |
| auth-port | (Optional) Authentication port for the RADIUS server that was specified. |
| <i>port-number</i> | (Optional) Number of the authentication port. The default is 1645 (for a RADIUS server). |
| acct-port | (Optional) Accounting port for the RADIUS server that was specified. |
| <i>port-number</i> | (Optional) Number of the accounting port. The default is 1646 (for a RADIUS server). |
| <i>server-group-name</i> | (Optional) Server group with which the specified server is associated. The default is <i>radius</i> (for a RADIUS server). |

Command Default

Currently, the *port-number* argument for the **auth-port** keyword and the *port-number* argument for the **acct-port** keyword default to 1645 and 1646, respectively. The default for the *server-group-name* argument is *radius*.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Dublin 17.11.1 | The <i>server-name</i> option was added to the command. |

Usage Guidelines

Multiple RADIUS servers having the same IP address can be configured on a device. The **auth-port** and **acct-port** keywords are used to differentiate the servers. The dead-detect interval of a server that is associated with a specified server group can be obtained by using the **server-group-name** keyword. (The dead-detect interval and retransmit values of a RADIUS server are set on the basis of the server group to which the server belongs. The same server can be part of multiple server groups.)

Examples

The following example shows that dead-criteria-detection information has been requested for a RADIUS server at the IP address 192.0.2.1:

```

Device# show aaa dead-criteria radius 192.0.2.1 radius

RADIUS Server Dead Criteria:
=====
Server Details:
  Address : 192.0.2.1
  Auth Port : 1645
  Acct Port : 1646
Server Group : radius
Dead Criteria Details:
  Configured Retransmits : 62
  Configured Timeout : 27
  Estimated Outstanding Transactions: 5
  Dead Detect Time : 25s
  Computed Retransmit Tries: 22
  Statistics Gathered Since Last Successful Transaction
=====
Max Computed Outstanding Transactions: 5
Max Computed Dead Detect Time: 25s
Max Computed Retransmits : 22

```

Examples

The following example shows that dead-criteria-detection information has been requested for a RADIUS server named ISE:

```

Device# show aaa dead-criteria radius server-name ISE

RADIUS Server Dead Criteria:
=====
Server Details:
  Address : 192.0.2.2
  Auth Port : 1645
  Acct Port : 1646
Server Group : radius
VRF : Mgmt-vrf
Dead Criteria Details:
  Configured Retransmits : 3
  Configured Timeout : 5
  Estimated Outstanding Access Transactions: 0
  Estimated Outstanding Accounting Transactions: 0
  Dead Detect Time : 5s
  Computed Retransmit Tries: 4
  Statistics Gathered Since Last Successful Transaction
=====
  Max Computed Outstanding Transactions: 1
  Max Computed Dead Detect Time: 10s
  Max Computed Retransmits : 10

```

The **Max Computed Dead Detect Time** is displayed in seconds. The other fields shown in the display are self-explanatory.

| Related Commands | Command | Description |
|------------------|---|---|
| | debug aaa dead-criteria transactions | Displays AAA dead-criteria transaction values. |
| | radius-server dead-criteria | Forces one or both of the criteria used to mark a RADIUS server as dead to be the indicated the constant. |
| | show aaa server-private | Displays the status of all private RADIUS servers. |

| Command | Description |
|------------------|---|
| show aaa servers | Displays information about the number of packets sent to and received from AAA servers. |

show aaa local

To display authentication, authorization, and accounting (AAA) local method options, use the **show aaa local** command.

show aaa local { **netuser** { *name* | **all** } | **statistics** | **user lockout** }

Syntax Description

| | |
|---------------------|---|
| netuser | Specifies the AAA local network or guest user database. |
| <i>name</i> | Network user name. |
| all | Specifies the network and guest user information. |
| statistics | Displays statistics for local authentication. |
| user lockout | Specifies the AAA local locked-out user. |

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

This is an example of output from the **show aaa local statistics** command:

```
Device# show aaa local statistics

Local EAP statistics

EAP Method          Success      Fail
-----
Unknown              0            0
EAP-MD5              0            0
EAP-GTC              0            0
LEAP                 0            0
PEAP                 0            0
EAP-TLS              0            0
EAP-MSCHAPV2        0            0
EAP-FAST             0            0

Requests received from AAA:                0
Responses returned from EAP:              0
Requests dropped (no EAP AVP):             0
Requests dropped (other reasons):          0
Authentication timeouts from EAP:         0

Credential request statistics
Requests sent to backend:                  0
Requests failed (unable to send):         0
Authorization results received

Success:                                   0
```

Fail: 0

show aaa servers

To display all authentication, authorization, and accounting (AAA) servers as seen by the AAA server MIB, use the **show aaa servers** command.

show aaa servers [**private** | **public** | [**detailed**]]

| Syntax Description | | |
|--------------------|-----------------------------|--|
| | detailed | (Optional) Displays private AAA servers as seen by the AAA server MIB. |
| | public | (Optional) Displays public AAA servers as seen by the AAA server MIB. |
| | detailed | (Optional) Displays detailed AAA server statistics. |
| Command Modes | User EXEC (>) | |
| | Privileged EXEC (>) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is a sample output from the **show aaa servers** command:

```
Device# show aaa servers

RADIUS: id 1, priority 1, host 172.20.128.2, auth-port 1645, acct-port 1646
State: current UP, duration 9s, previous duration 0s
Dead: total time 0s, count 0
Quarantined: No
Authen: request 0, timeouts 0, failover 0, retransmission 0
Response: accept 0, reject 0, challenge 0
Response: unexpected 0, server error 0, incorrect 0, time 0ms
Transaction: success 0, failure 0

Estimated Outstanding Accounting Transactions: 0
Estimated Throttled Access Transactions: 0
Estimated Throttled Accounting Transactions: 0
Maximum Throttled Transactions: access 0, accounting 0
```

show aaa sessions

To display authentication, authorization, and accounting (AAA) sessions as seen by the AAA Session MIB, use the **show aaa sessions** command.

show aaa sessions

Syntax Description This command has no arguments or keywords.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

The following is sample output from the **show aaa sessions** command:

```
Device# show aaa sessions

Total sessions since last reload: 7
Session Id: 4007
  Unique Id: 4025
  User Name: *not available*
  IP Address: 0.0.0.0
  Idle Time: 0
  CT Call Handle: 0
```

show access-lists fqdn statistics

To display the latency statistics of the fully qualified domain name (FQDN) ACLs, use the **show access-lists fqdn statistics** command in privileged EXEC mode.

show access-lists fqdn statistics

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Bengaluru 17.6.1 | This command was introduced. |

Examples

The following is a sample output from the **show access-lists fqdn statistics** command:

```
Device# show access-lists fqdn statistics

IPv4 ACL programming requests: 231
IPv4 ACL programming timeout: 24
IPv4 ACL programming latency:
Min 2 ms
Max 134 ms
Avg 56 ms
IPv6 ACL programming requests: 178
IPv6 ACL programming timeout: 6
IPv6 ACL programming latency:
Min 2 ms
Max 253 ms
Avg 24 ms
```

Related Commands

| Command | Description |
|------------------|--|
| show fqdn | Displays the resolved IP addresses for the FQDN entries from the local cache database. |

show access-session

To display information about Session Aware Networking sessions, use the **show access-session** command in privileged EXEC mode.

```
show access-session { database | brief | cache | event-logging [ mac mac-adress |
display-all | unauth ] | fqdn [ passthru-domain-list | list-domain list-domain | fqdn-maps
] | history | info | interface interface-name interface-number | mac mac-address |
method method | registrations | session-id session-id | statistics | switch switch-number |
details }
```

Syntax Description

| | |
|----------------------|--|
| database | (Optional) Displays session data stored in the session database. This allows you to see information such as the VLAN ID, which is not cached internally. A warning message is displayed if the data stored in the session database does not match the internally cached data. |
| method | (Optional) Displays information about subscriber sessions using one of the following authentication methods: <ul style="list-style-type: none"> • dot1x: IEEE 802.1X authentication method. • mab: MAC authentication bypass (MAB) method. • webauth: Web authentication method. <p>If you specify a method, you can also specify an interface.</p> |
| brief | (Optional) Displays brief information about authentication sessions. |
| cache | (Optional) Displays Session Manager cache information |
| event-logging | (Optional) Displays event logs. |
| fqdn | (Optional) Displays the FQDN configurations. |
| history | (Optional) Displays historic information. |
| info | (Optional) Displays brief information about all sessions. |
| interface | (Optional) Displays information about subscriber sessions that match the specified client interface type. To display the valid keywords and arguments for interfaces, use the question mark (?) online help function. |
| mac | (Optional) Displays information about subscriber sessions with the specified client MAC address. |
| session-id | (Optional) Displays information about subscriber sessions with the specified client session identifier. |
| registrations | (Optional) Displays information about all registered session manager clients including the registered authentication methods. |
| statistics | (Optional) Displays information about authentication session statistics. |

details (Optional) Displays detailed information about each session instead of displaying a single-line summary.

Command Default Information about Session Aware Networking sessions is displayed.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|---|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Dublin 17.11.1 | This command was modified. The info keyword was introduced for this command. |

Usage Guidelines If you enter the **show access-session** command without any keywords or arguments, the information is displayed for all the sessions on the switch. When you specify an identifier, information is displayed for only those sessions that match the identifier.

Examples

The following is sample output from the **show access-session** command:

```
Device# show access-session
Interface          MAC Address      Method  Domain  Status Fg  Session ID
-----
Tel/0/23           000c.2946.8752  mab     DATA   Auth   910C140B00003E9AE7A39739
Gi3/0/6            0015.0100.0001  dot1x   DATA   Auth   910C140B00003E9CE7A3DEC1

Session count = 2

Key to Session Events Blocked Status Flags:

Session count = 2

Key to session Method Domain Status:

M - Method :
Dlx - 802.1x, Mab - Mab, Web - WebAuth, N/A - Not Applicable
D - Domain:
D - Data, V - Voice, U - Unknown
S - Status:
AZ - Authorized, UZ - Unauthorized
UA - Un-Available
```

The table below describes the significant fields shown in the displays.

Table 196: show access-session Field Descriptions

| Field | Description |
|-------------|---|
| Interface | The interface on which the client is connected. |
| MAC Address | The MAC address of the client. |
| Method | The AAA authentication method. |
| Domain | The name of the domain, either DATA or VOICE. |
| Status | The status of the authentication session. |
| M:D:S | The consolidated column for Method, Domain, and Status. |

| | |
|-----------|---|
| Fg | <p>These status flags indicate that events are temporarily blocked from being processed in a session, usually because an asynchronous action is in progress. A transient block, from less than a second to a few seconds maximum, is to be expected; a session that remains blocked for more than a few seconds indicates an issue.</p> <p>All flags are mutually exclusive except P, which can be displayed with any other flag.</p> <p>Key to Session Events Blocked Status Flags:</p> <ul style="list-style-type: none"> • A - Applying Policy (multiline status for details): A policy action (event) is being carried out and involves asynchronous processing that is in progress. Use the details keyword to see the name of the event being processed. • D - Awaiting Deletion—Session deletion has begun. One or more asynchronous actions are currently in progress (either retrieving accounting data from the platform or deleting the IF ID). • F - Final Removal in progress: The D stage is over, but the session has not been deleted yet. • I - Awaiting IIF ID allocation: The IIF ID is a system-wide identifier for a session or any other object the platform must know about. The platform must have the IIF ID before proceeding. • P - Pushed Session: Indicates that the session was authenticated earlier and pushed from the wireless controller module (WCM). The session manager only tracks the session; it does not perform authentication. This is for wireless sessions only. It is a permanent flag, and can be displayed with other flags. • R - Removing User Profile (multiline status for details): User profile is being removed asynchronously by the enforcement policy module (EPM). • U - Applying User Profile (multiline status for details): User profile is being applied asynchronously by the EPM. • X - Unknown Blocker: Event is blocked for an unknown reason. |
| IPv4 | The IPv4 address of the client. |
| VLAN | The VLAN ID applied through ISE or service template. |
| Policy | The name of the policy map configured. |
| User-Role | The role of the client. |
| Handle | The context handle of clients registered with the authorization manager. |

Related Commands

| Command | Description |
|---|---|
| show access-session interface <i>interface-name</i> details | Displays all the details of the clients of the given interface. |
| show access-session registrations | Displays the components registered with session manager. |

show authentication brief

To display brief information about authentication sessions for a given interface, use the **show authentication brief** command in either user EXEC or privileged EXEC mode.

```
show authentication brief [switch {switch-number | active | standby} {R0}]
```

| Syntax Description | | |
|----------------------|--|---|
| <i>switch-number</i> | | Valid values for the <i>switch-number</i> variable are from 1 to 9. |
| R0 | | Displays information about the Route Processor (RP) slot 0. |
| active | | Specifies the active instance. |
| standby | | Specifies the standby instance. |

The following is a sample output from the **show authentication brief** command for standby instances:

```
Device# show authentication brief switch standby R0
```

```
No sessions currently exist
```

The table below describes the significant fields shown in the displays.

Table 197: show authentication brief Field Descriptions

| Field | Description |
|-------------|--|
| Interface | The type and number of the authentication interface. |
| MAC Address | The MAC address of the client. |
| AuthC | Indicates authentication status. |
| AuthZ | Indicates authorization status. |

| Field | Description |
|--------|---|
| Fg | Flag indicates the current status. The valid values are: <ul style="list-style-type: none">• A—Applying policy (multi-line status for details)• D—Awaiting removal• F—Final removal in progress• I—Awaiting IIF ID allocation• P—Pushed session• R—Removing user profile (multi-line status for details)• U—Applying user profile (multi-line status for details)• X—Unknown blocker |
| Uptime | Indicates the duration since which the session came up |

show authentication sessions

To display information about current Auth Manager sessions, use the **show authentication sessions** command.

```
show authentication sessions [database] [handle handle-id [details]] [interface type number
[details]] [mac mac-address [interface type number]] [method method-name [interface type number
[details]]] [session-id session-id [details]]
```

Syntax Description

| | |
|-------------------------------------|--|
| database | (Optional) Shows only data stored in session database. |
| handle <i>handle-id</i> | (Optional) Specifies the particular handle for which Auth Manager information is to be displayed. |
| details | (Optional) Shows detailed information. |
| interface <i>type number</i> | (Optional) Specifies a particular interface type and number for which Auth Manager information is to be displayed. |
| mac <i>mac-address</i> | (Optional) Specifies the particular MAC address for which you want to display information. |
| method <i>method-name</i> | (Optional) Specifies the particular authentication method for which Auth Manager information is to be displayed. If you specify a method (dot1x , mab , or webauth), you may also specify an interface. |
| session-id <i>session-id</i> | (Optional) Specifies the particular session for which Auth Manager information is to be displayed. |

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **show authentication sessions** command to display information about all current Auth Manager sessions. To display information about specific Auth Manager sessions, use one or more of the keywords.

This table shows the possible operating states for the reported authentication sessions.

Table 198: Authentication Method States

| State | Description |
|-------------|--|
| Not run | The method has not run for this session. |
| Running | The method is running for this session. |
| Failed over | The method has failed and the next method is expected to provide a result. |

| State | Description |
|--------------|---|
| Success | The method has provided a successful authentication result for the session. |
| Authc Failed | The method has provided a failed authentication result for the session. |

This table shows the possible authentication methods.

Table 199: Authentication Method States

| State | Description |
|---------|---------------------------|
| dot1x | 802.1X |
| mab | MAC authentication bypass |
| webauth | web authentication |

The following example shows how to display all authentication sessions on the device:

```
Device# show authentication sessions

Interface   MAC Address      Method  Domain  Status      Session ID
Gi1/0/48    0015.63b0.f676  dot1x   DATA   Authz Success 0A3462B1000000102983C05C
Gi1/0/5     000f.23c4.a401  mab     DATA   Authz Success 0A3462B10000000D24F80B58
Gi1/0/5     0014.bf5d.d26d  dot1x   DATA   Authz Success 0A3462B10000000E29811B94
```

The following example shows how to display all authentication sessions on an interface:

```
Device# show authentication sessions interface gigabitethernet2/0/47

      Interface: GigabitEthernet2/0/47
      MAC Address: Unknown
      IP Address: Unknown
      Status: Authz Success
      Domain: DATA
      Oper host mode: multi-host
      Oper control dir: both
      Authorized By: Guest Vlan
      Vlan Policy: 20
      Session timeout: N/A
      Idle timeout: N/A
      Common Session ID: 0A3462C80000000000002763C
      Acct Session ID: 0x00000002
      Handle: 0x25000000

Runnable methods list:
  Method  State
  mab     Failed over
  dot1x   Failed over
-----
      Interface: GigabitEthernet2/0/47
      MAC Address: 0005.5e7c.da05
      IP Address: Unknown
      User-Name: 00055e7cda05
      Status: Authz Success
```

```
          Domain: VOICE
    Oper host mode: multi-domain
  Oper control dir: both
    Authorized By: Authentication Server

  dot1x    Not run
```

show cisp

To display Client Information Signaling Protocol (CISP) information for a specified interface, use the **show cisp** command in privileged EXEC mode.

```
show cisp { [clients | interface interface-id] | registrations | summary }
```

| Syntax Description | | |
|--------------------------------------|--|---|
| clients | | (Optional) Display CISP client details. |
| interface <i>interface-id</i> | | (Optional) Display CISP information about the specified interface channels. |
| registrations | | Displays CISP registrations. |
| summary | | (Optional) Displays CISP summary. |

| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|

```

Gi3/0/23

Related Commands

| Command | Description |
|---|--|
| cisp enable | Enables CISP. |
| dot1x credentials <i>profile</i> | Configures a profile on a supplicant device. |

show device-tracking capture-policy

To display the rules that the system pushes to the hardware (forwarding layer), enter the **show device-tracking capture-policy** command in privileged EXEC mode. These rules determine which packets are punted to SISF for further action. These rules are a translation of the policy that is applied to the interface or VLAN.

show device-tracking capture-policy [**interface** *interface_type_no* | **vlan** *vlan_id*]

| Syntax Description | |
|---|--|
| interface <i>interface_type_no</i> | Displays message capture policy information for the interface you specify. Enter an interface type and number. Use the question mark (?) online help function to display the types of interfaces on the device. |
| vlan <i>vlan_id</i> | Displays message capture policy information for the VLAN ID you specify. The valid value range is from 1 to 4095. |

Command Modes Privileged EXEC (#)

show device-tracking counters

To display information about the number of broadcast, multicast, bridged, unicast, probe, dropped device-tracking messages and faults received on an interface or VLAN or both, enter the **show device-tracking counters** command in privileged EXEC mode. Where applicable, the messages are categorized by protocol. The list of protocols include Address Resolution Protocol (ARP), Neighbor Discovery Protocol (NDP), DHCPv6, DHCPv4, Address Collision Detection (ACD), and Duplicate Address Detection (DAD).

show device-tracking counters [**all** | **interface** *interface_type_no* | **vlan** *vlan_id*]

Syntax Description

| | |
|---|---|
| all | Displays information for all interfaces and VLANs on the device where a policy is attached. |
| interface <i>interface_type_no</i> | Displays information for the specified interface. Enter an interface type and number. Use the question mark (?) online help function to display the types of interfaces on the device. |
| vlan <i>vlan_id</i> | Displays information for the VLAN ID you specify. The range is from 1 to 4095. |

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

When you enter the **show device-tracking counters** command, you must enter one of the keywords that follow, that is, **all**, or **interface** *interface_type_no* , or **vlan** *vlan_id* .

If you specify an interface or VLAN where a policy is not attached, the following message is displayed: % no ipv6 snooping policy attached on <interface number or VLAN ID>

Examples

The following is sample output from the **show device-tracking counters** command. Information relating to a particular VLAN (VLAN 10) is displayed here:

```
Device# show device-tracking counters vlan 10
Received messages on vlan 10 :
Protocol      Protocol message
NDP           RA[2479] NS[1757] NA[2794]
DHCPv6
ARP           REP[878]
DHCPv4
ACD&DAD      --[3]

Received Broadcast/Multicast messages on vlan 10 :
Protocol      Protocol message
NDP           RA[2479] NS[3] NA[5]
DHCPv6
```

show device-tracking counters

```

ARP                REP[1]
DHCPv4

Bridged messages from vlan 10  :
Protocol           Protocol message
NDP                RA[1238] NS[1915] NA[878]
DHCPv6
ARP                REQ[877]
DHCPv4
ACD&DAD           --[1]

Broadcast/Multicast converted to unicast messages from vlan 10  :
Protocol           Protocol message
NDP
DHCPv6
ARP
DHCPv4
ACD&DAD

Probe message on vlan 10  :
Type               Protocol message
PROBE_SEND         NS[1037] REQ[877]
PROBE_REPLY        NA[1037] REP[877]

Limited Broadcast to Local message on vlan 10  :
Type               Protocol message
NDP
DHCPv6
ARP
DHCPv4

Dropped messages on vlan 10  :
Feature            Protocol Msg [Total dropped]
Device-tracking:   NDP          RA [1241]
                  reason:   Packet not authorized on port [1241]

                  NS [2]
                  reason:   Silent drop [2]

                  NA [1039]
                  reason:   Silent drop [1037]
                  reason:   Packet accepted but not forwarded [2]

                  ARP        REP [878]
                  reason:   Silent drop [877]
                  reason:   Packet accepted but not forwarded [1]

ACD&DAD:          --          -- [2]

Faults on vlan 10  :
```

show device-tracking database

To display details of the binding table database, enter the **show device-tracking database** command in privileged EXEC mode.

```
show device-tracking database [ address { hostname_address | all } ] [ interface interface_type_no ] [ vlanid vlan ] [ details ] | details | interface interface_type_no [ details ] [ vlanid vlan ] | mac [ 48_bit_hw_add ] [ details ] [ interface interface_type_no ] [ vlanid vlan ] | prefix [ prefix_address | all ] [ details ] [ interface interface_type_no ] | vlanid vlanid [ details ] ]
```

Syntax Description

| | |
|---|---|
| address { <i>hostname_address</i> all } | Displays binding table information for a particular IP address or for all addresses |
| interface <i>interface_type_no</i> | Displays binding table information for the specified interface. Enter an interface type and number. Use the question mark (?) online help function to display the types of interfaces on the device. |
| vlanid <i>vlan</i> | Displays binding table information for the VLAN ID you specify. The valid value range is from 1 to 4095. |
| details | Displays detailed information. |
| mac | Displays binding table information for the MAC address you specify. |
| <i>48_bit_hw_add</i> | Enter a 48-bit hardware address. |
| prefix | Displays binding table information for the IPv6 prefix you specify. |
| <i>prefix_address</i> | Enter an IPv6 prefix. |
| all | Displays binding table information for all the available IPv6 prefixes. |

Table 200: show device-tracking database details Field Descriptions

| Field | Description |
|---|--|
| Binding table configuration: <ul style="list-style-type: none"> • max/box • max/vlan • max/port • max/mac | Displays binding table settings. The values correspond with what is configured using the device-tracking binding command in global configuration mode. <ul style="list-style-type: none"> • max/box: The value displayed here corresponds with the configured value for the max-entries no_of_entries keyword. • max/vlan: The value displayed here corresponds with the configured value for the vlan-limit no_of_entries keyword. • max/port: The value displayed here corresponds with the configured value for the port-limit no_of_entries keyword. • max/mac: The value displayed here corresponds with the configured value for the mac-limit no_of_entries keyword. |
| Binding table current counters: <ul style="list-style-type: none"> • dynamic • local • total | Displays the number of entries in the table. <ul style="list-style-type: none"> • dynamic: Dynamic entries are created by learning events that dynamically populate the binding table. • local: Local entries are automatically created when you configure an SVI on the device. One of ways in which SISF uses a local entry, is in the context of polling. If polling is enabled, the SVI address is used as the source address of an ARP probe. • total: The total is a sum of the dynamic, local, and static binding entries. |
| Binding table counters by state: | Displays the number of entries in each state. The state can be REACHABLE, STALE, DOWN. |
| Codes | Clarifies abbreviations that are used to signify learning events. The first column of a binding entry uses an abbreviated code, which tells you about the learning event that resulted in creation of that binding entry. |

| Field | Description |
|-------------------------|---|
| Preflevel flags (prlvl) | <p>A list of preference level number codes and clarification for what the number codes in the <code>prlvl</code> column of the binding table mean.</p> <p>The codes signify a broad classification and multiple codes can apply to an entry. What is displayed in the <code>prlvl</code> column is a sum of these number codes and signifies a corresponding preference level.</p> <p>For example if an ARP entry (preference code: 0001) is learned from an access interface (preference code: 0004), the value displayed in the <code>prlvl</code> column is "0005".</p> <p>1 is the lowest preference level, and 100 is the highest.</p> <p>A binding entry with a higher preference is given preference in case of a collision. For example, if the same entry is seen on two different interfaces, the value in the <code>prlvl</code> column, determines which entry is retained.</p> |
| Network Layer Address | The IP address of the host from which a packet is received. |
| Link Layer Address | The MAC address of the host. |
| Mode | Displays one of the following values: "invalid", "unsupp", "access", "trunk", "vpc", "svi", "virtual", "pseudowire", "unkn", "bdi", "pseudoport". |
| vlan(prim) | The host's VLAN ID |
| prlvl | <p>A value between 1 and 100 is displayed, with 1 having the lowest preference level, and 100 having the highest preference level.</p> <p>See <code>Preflevel flags</code> above to know what the value displayed here means.</p> |
| age | The total age of the entry in seconds (s) or minutes (mn) since the the last time the entry was refreshed. When it is refreshed (sign-of-life from the host), this value is reset. |
| state | <p>The current state of an entry, which can be one of the stable or transitional states.</p> <p>Stable state values are: REACHABLE, DOWN, and STALE,</p> <p>Transitional states values are: VERIFY, INCOMPLETE, and TENTATIVE.</p> |

| Field | Description |
|------------------|---|
| Time left | Displays the amount of time left until the next action in the current state. |
| In Crimson | <p>A <i>yes</i> or <i>no</i> value which indicates if the entry has been added to another database. The information is then used by other applications, like Cisco DNA Center.</p> <p>Typically, all the entries that are in a binding table are also added to this database.</p> <p>This is used by the technical support team, for troubleshooting and to diagnose a problem.</p> |
| Client ID | <p>This field is applicable only to virtual machines (VMs) in Cisco Software-Defined Access (SDA) deployments.</p> <p>It refers to the actual MAC address of a VM in a bridged networking mode, where the hosting device is a wireless client with a non-promiscuous network interface (NIC).</p> |
| Session ID | <p>This field is applicable only to VMs in SDA deployments.</p> <p>It refers to an access session ID for a VM in a bridged networking mode. Each Session ID is associated with a Client ID. SISF maintains this association and transfers it along as the VM roams or moves across fabric edges in an SDA setup.</p> |
| Policy (feature) | <p>Displays the name of the policy applied to the interface or VLAN.</p> <p>The "(feature)" displayed is always "Device-tracking", because only SISF-based device-tracking supports the creation of binding entries.</p> |

show device-tracking events

To display SISF binding table-related events, enter the **show device-tracking events** command in privileged EXEC mode. The types of events that are displayed includes the creation of binding table entries and all updates to an entry. Updates may be state changes, or, changes in the MAC, VLAN, or interface information for an entry.

show device-tracking events

| Syntax Description | This command has no arguments or keywords. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Default | SISF binding table events are displayed. | | | | |
| Command Modes | Privileged EXEC (#) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |
| Usage Guidelines | The output of this command is used by the technical support team, for troubleshooting. | | | | |

Examples

The following is sample output for the **show device-tracking events** command. It shows you the kind of binding table events that the system logs:

```
Device# show device-tracking events
[Wed Mar 23 19:08:33.000] SSID 0 FSM Feature Table running for event ACTIVE_REGISTER in
state CREATING
[Wed Mar 23 19:08:33.000] SSID 0 Transition from CREATING to READY upon event ACTIVE_REGISTER

[Wed Mar 23 19:08:33.000] SSID 1 FSM Feature Table running for event ACTIVE_REGISTER in
state CREATING
[Wed Mar 23 19:08:33.000] SSID 1 Transition from CREATING to READY upon event ACTIVE_REGISTER

[Wed Mar 23 19:09:25.000] SSID 0 FSM sisf_mac_fsm running for event MAC_TENTV in state
MAC-CREATING
[Wed Mar 23 19:09:25.000] SSID 0 Transition from MAC-CREATING to MAC-TENTATIVE upon event
MAC_TENTV
[Wed Mar 23 19:09:25.000] SSID 1 Created Entry origin IPv4 ARP MAC 00a5.bf9c.e051 IPV4
10.0.0.1
[Wed Mar 23 19:09:25.000] SSID 0 FSM sisf_mac_fsm running for event MAC_VERIFIED in state
MAC-TENTATIVE
[Wed Mar 23 19:09:25.000] SSID 0 Transition from MAC-TENTATIVE to MAC-REACHABLE upon event
MAC_VERIFIED
[Wed Mar 23 19:09:25.000] SSID 1 FSM Binding table running for event VALIDATE_LLA in state
CREATING
[Wed Mar 23 19:09:25.000] SSID 1 FSM Binding table running for event SET_TENTATIVE in state
CREATING
[Wed Mar 23 19:09:25.000] SSID 1 Transition from CREATING to TENTATIVE upon event
SET_TENTATIVE
[Wed Mar 23 19:09:25.000] SSID 1 Entry State changed origin IPv4 ARP MAC 00a5.bf9c.e051
IPV4 10.0.0.1
```

```
[Wed Mar 23 20:07:27.000] SSID 0 FSM sisf_mac_fsm running for event MAC_DELETE_NOS in state
MAC-REACHABLE
[Wed Mar 23 20:07:27.000] SSID 0 Transition from MAC-REACHABLE to MAC-NONE upon event
MAC_DELETE_NOS
[Wed Mar 23 20:07:27.000] SSID 1 Transition from REACHABLE to NONE upon event DELETE
```

show device-tracking features

To display the device-tracking features that are enabled, enter the **show device-tracking features** command in privileged EXEC mode. The "features" include SISF-based device-tracking, and security features like IPv6 RA Guard, IPv6 DHCP Guard, Layer 2 DHCP Relay, and so on, that use SISF.

show device-tracking features

| | |
|---------------------------|--|
| Syntax Description | This command has no arguments or keywords. |
|---------------------------|--|

| | |
|----------------------|---------------------|
| Command Modes | Privileged EXEC (#) |
|----------------------|---------------------|

| | | |
|------------------------|-----------------------------|------------------------------|
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output for the **show device-tracking features** command.

```
Device# show device-tracking features
Feature name  priority state
Device-tracking  128  READY
Source guard   32   READY
```

show device-tracking messages

To display a list of device-tracking related activities, enter the **show device-tracking messages** command in privileged EXEC mode.

show device-tracking messages [**detailed** *no_of_messages*]

| | |
|---------------------------|--|
| Syntax Description | detailed <i>no_of_messages</i> Displays a more detailed format of the list of device-tracking messages. Enter a value between 1 and 255, to specify the number of messages that must be displayed in a detailed format. |
|---------------------------|--|

| | |
|----------------------|---------------------|
| Command Modes | Privileged EXEC (#) |
|----------------------|---------------------|

| | | |
|------------------------|-----------------------------|------------------------------|
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

The following is sample output for the **show device-tracking messages** command. The summarized and detailed versions of the output are displayed:

```
Device# show device-tracking messages
[Wed Mar 23 19:09:25.000] VLAN 1, From Te1/0/2 MAC 00a5.bf9c.e051: ARP::REP, 10.0.0.1,
[Wed Mar 23 20:03:22.000] VLAN 1, From Te1/0/2 MAC 00a5.bf9c.e051: ARP::REP, 10.0.0.1,

Device# show device-tracking messages detailed 255
[Wed Mar 23 19:09:25.000] VLAN 1, From Te1/0/2 seclvl [guard], MAC 00a5.bf9c.e051: ARP::REP,

1 addresses advertised:
  IPv6 addr: 10.0.0.1,

[Wed Mar 23 20:03:22.000] VLAN 1, From Te1/0/2 seclvl [guard], MAC 00a5.bf9c.e051: ARP::REP,

1 addresses advertised:
  IPv6 addr: 10.0.0.1,
```

show device-tracking policies

To display *all* the device-tracking policies on the device, enter the **show device-tracking policies** command in privileged EXEC mode.

show device-tracking policies [**details** | **interface** *interface_type_no* [**details**] | **vlan** *vlanid*]

| Syntax Description | details | Displays information about the policy targets and policy parameters of all device-tracking policies on the device |
|--------------------|---|---|
| | interface <i>interface_type_no</i> | Displays all policies applied to the the specified interface. Enter an interface type and number. Use the question mark (?) online help function to display the types of interfaces on the device. |
| | vlan <i>vlanid</i> | Displays all policies applied to the the specified VLAN. The valid value range is from 1 to 4095. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output for the **show device-tracking policies** command with the **details** keyword. It shows that there is only one policy on the device. It shows the target to which the policy is applied and the policy parameters.

```
Device# show device-tracking policies details
```

```
Target          Type Policy          Feature          Target range
Tel1/0/1        PORT  sislef-01        Device-tracking  vlan all
```

```
Device-tracking policy sislef-01 configuration:
```

```
security-level guard
device-role node
gleaning from Neighbor Discovery
gleaning from DHCP6
gleaning from ARP
gleaning from DHCP4
NOT gleaning from protocol unkn
tracking enable
```

```
Policy sislef-01 is applied on the following targets:
```

```
Target          Type Policy          Feature          Target range
Tel1/0/1        PORT  sislef-01        Device-tracking  vlan all
```

show device-tracking policy

To display information about a particular policy, enter the **show device-tracking policy** command in privileged EXEC mode. Displayed information includes the list of targets to which the policy is applied, and policy parameters.

show device-tracking policy *policy_name*

Syntax Description

policy_name Enter the name of the policy.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output for the **show device-tracking policy** command. Details of policy *sisf-01* are displayed.

```
Device# show device-tracking policy sifs-01
Device-tracking policy sifs-01 configuration:
  security-level guard
  device-role node
  gleaning from Neighbor Discovery
  gleaning from DHCP6
  gleaning from ARP
  gleaning from DHCP4
  NOT gleaning from protocol unkn
  tracking enable
Policy sifs-01 is applied on the following targets:
Target          Type  Policy          Feature          Target range
Tel/0/1        PORT  sifs-01        Device-tracking  vlan all
```

show dot1x

To display IEEE 802.1x statistics, administrative status, and operational status for a device or for the specified port, use the **show dot1x** command in user EXEC or privileged EXEC mode.

show dot1x [**all** [**count** | **details** | **statistics** | **summary**]] [**interface** *type number* [**details** | **statistics**]] [**statistics**]

Syntax Description

| | |
|-------------------------------------|--|
| all | (Optional) Displays the IEEE 802.1x information for all interfaces. |
| count | (Optional) Displays total number of authorized and unauthorized clients. |
| details | (Optional) Displays the IEEE 802.1x interface details. |
| statistics | (Optional) Displays the IEEE 802.1x statistics for all interfaces. |
| summary | (Optional) Displays the IEEE 802.1x summary for all interfaces. |
| interface <i>type number</i> | (Optional) Displays the IEEE 802.1x status for the specified port. |

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

The following is sample output from the **show dot1x all** command:

```
Device# show dot1x all

Sysauthcontrol          Enabled
Dot1x Protocol Version      3
```

The following is sample output from the **show dot1x all count** command:

```
Device# show dot1x all count

Number of Dot1x sessions
-----
Authorized Clients      = 0
UnAuthorized Clients    = 0
Total No of Client      = 0
```

The following is sample output from the **show dot1x all statistics** command:

```
Device# show dot1x statistics
```

Dot1x Global Statistics for

```
-----  
RxStart = 0      RxLogoff = 0      RxResp = 0      RxRespID = 0  
RxReq = 0        RxInvalid = 0     RxLenErr = 0  
RxTotal = 0  
  
TxStart = 0      TxLogoff = 0      TxResp = 0  
TxReq = 0        ReTxReq = 0       ReTxReqFail = 0  
TxReqID = 0      ReTxReqID = 0    ReTxReqIDFail = 0  
TxTotal = 0
```

show eap pac peer

To display stored Protected Access Credentials (PAC) for Extensible Authentication Protocol (EAP) Flexible Authentication via Secure Tunneling (FAST) peers, use the **show eap pac peer** command in privileged EXEC mode.

show eap pac peer

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

The following is sample output from the **show eap pac peers** command:

```
Device# show eap pac peers
No PACs stored
```

Related Commands

| Command | Description |
|--------------------|--|
| clear eap sessions | Clears EAP session information for the device or for the spe |

show fqdn

To display the resolved IP addresses for the fully qualified domain name (FQDN) entries in the local cache database, use the **show fqdn** command in either user EXEC mode or privileged EXEC mode.

```
show fqdn { database [{ dump | fqdn name [ ipv4 address | ipv6 address ] | statistics }] |
packet statistics | summary }
```

| Syntax Description | Parameter | Description |
|--------------------|--------------------------|---|
| | database | Displays the FQDN-to-IP address bindings, along with the time-to-live (TTL) for those bindings, and the status of the bindings. |
| | dump | (Optional) Displays all the cached and transient FQDN entries from the database. |
| | fqdn name | (Optional) Displays cached entries from the database for the specified FQDN. |
| | ipv4 address | (Optional) Displays cached entries from the database for the specified IP address. |
| | ipv6 address | (Optional) Displays cached entries from the database for the specified IPv6 address. |
| | statistics | (Optional) Displays FQDN database statistics. |
| | packet statistics | Displays FQDN packet statistics. |
| | summary | Displays FQDN TTL timeout factor and a summary of the registered FQDNs. |

| Command Modes | Mode |
|---------------|---------------------|
| | User EXEC (>) |
| | Privileged EXEC (#) |

| Command History | Release | Modification |
|-----------------|-------------------------------|--|
| | Cisco IOS XE Bengaluru 17.5.1 | This command was introduced. |
| | Cisco IOS XE Bengaluru 17.6.1 | This command was modified. The ipv6 keyword was introduced. |

Examples

The following is a sample output from the **show fqdn summary** command:

```
Device# show fqdn summary

Registered FQDNs:
FQDN: host1.9k.com
Registered Module IDs: FQDN ACL Mgr,
FQDN: host2.9k.com
Registered Module IDs: FQDN ACL Mgr,
FQDN: host3.9k.com
Registered Module IDs: FQDN ACL Mgr,
FQDN: host4.9k.com
Registered Module IDs: FQDN ACL Mgr,
```

The following is a sample output from the **show fqdn database** command:

```
Device# show fqdn database
```

```

===== MAIN DB =====
FQDN Name: example.cisco.com
IP Address Type TTL
10.11.224.132 IPv4 313/370
10.11.112.150 IPv4 313/370

```

The following is a sample output from the **show fqdn packet statistics** command:

```

Device# show fqdn packet statistics

Total DNS Pkts Rcvd : 676
IPv4 DNS Pkts Rcvd : 676
IPv6 DNS Pkts Rcvd : 0
Total DNS Pkts for registered FQDNs : 2

Related Commands

| Command | Description |
|-------------------------------|---|
| show ip access-lists | Displays the contents of all the current IP access lists. |
| show ipv6 access-lists | Displays the contents of all the current IPv6 access lists. |

show ip access-lists

To display the contents of all current IP access lists, use the **show ip access-lists** command in user EXEC or privileged EXEC modes.

```
show ip access-lists [{ access-list-number access-list-number-expanded-range access-list-name | dynamic
[dynamic-access-list-name] | interface name number [{ in | out } ] }
```

| Syntax Description | | |
|--|------------|---|
| <i>access-list-number</i> | (Optional) | Number of the IP access list to display. |
| <i>access-list-number-expanded-range</i> | (Optional) | Expanded range of the IP access list to display. |
| <i>access-list-name</i> | (Optional) | Name of the IP access list to display. |
| dynamic <i>dynamic-access-list-name</i> | (Optional) | Displays the specified dynamic IP access lists. |
| interface <i>name number</i> | (Optional) | Displays the access list for the specified interface. |
| in | (Optional) | Displays input interface statistics. |
| out | (Optional) | Displays output interface statistics. |

Note Statistics for OGACL is not supported

Command Default All standard and expanded IP access lists are displayed.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **show ip access-lists** command provides output identical to the **show access-lists** command, except that it is IP-specific and allows you to specify a particular access list.

The output of the **show ip access-lists interface** command does not display dACL or ACL filter IDs. This is because the ACLs are attached to the virtual ports created by multidomain authentication for each authentication session; instead of the physical interface. To display dACL or ACL filter IDs, use the **show ip access-lists access-list-name** command. The *access-list-name* should be taken from the **show access-session interface interface-name detail** command output. The *access-list-name* is case sensitive.

Examples

The following is a sample output from the **show ip access-lists** command when all access lists are requested:

```

Device# show ip access-lists

Extended IP access list 101
  deny udp any any eq nntp
  permit tcp any any
  permit udp any any eq tftp
  permit icmp any any
  permit udp any any eq domain
Role-based IP access list r1
  10 permit tcp dst eq telnet
  20 permit udp
FQDN IP access list facl
  10 permit ip host 10.1.1.1 host dynamic www.google.com
  20 permit tcp 10.10.0.0 0.255.255.255 eq ftp host dynamic www.cisco.com log
  30 permit udp host dynamic www.youtube.com any
  40 permit ip 10.3.4.0 0.0.0.255 any
Extended Resolved IP access list facl
  200000 permit tcp 10.0.0.0 0.255.255.255 eq ftp host 10.10.10.1 log
  200001 permit tcp 10.0.0.0 0.255.255.255 eq ftp host 10.10.10.2 log
  300000 permit udp host dynamic 10.11.11.11 any
  300001 permit udp host dynamic 10.11.11.12 any
  400000 permit ip 10.3.4.0 0.0.0.255 any

```

The table below describes the significant fields shown in the display.

Table 201: show ip access-lists Field Descriptions

| Field | Description |
|----------------------------------|--|
| Extended IP access list | Extended IP access-list name/number. |
| Role-based IP access list | Role-based IP access-list name. |
| FQDN IP access list | FQDN IP access-list name. |
| Extended Resolved IP access list | Extended resolved IP access-list name. |
| deny | Packets to reject. |
| udp | User Datagram Protocol. |
| any | Source host or destination host. |
| eq | Packets on a given port number. |
| nntp | Network News Transport Protocol. |
| permit | Packets to forward. |
| dynamic | Dynamically resolves domain name. |
| tcp | Transmission Control Protocol. |
| tftp | Trivial File Transfer Protocol. |
| icmp | Internet Control Message Protocol. |
| domain | Domain name service. |

The following is a sample output from the **show ip access-lists** command when the name of a specific access list is requested:

```
Device# show ip access-lists Internetfilter

Extended IP access list Internetfilter
  permit tcp any 192.0.2.0 255.255.255.255 eq telnet
  deny tcp any any
  deny udp any 192.0.2.0 255.255.255.255 lt 1024
  deny ip any any log
```

The following is a sample output from the **show ip access-lists** command using the **dynamic** keyword:

```
Device# show ip access-lists dynamic CM_SF#1

Extended IP access list CM_SF#1
  10 permit udp any any eq 5060 (650 matches)
  20 permit tcp any any eq 5060
  30 permit udp any any dscp ef (806184 matches)
```

Related Commands

| Command | Description |
|----------------------------------|--|
| deny | Sets conditions in a named IP access list or OGACL that will deny packets. |
| ip access-group | Applies an ACL or OGACL to an interface or a service policy map. |
| ip access-list | Defines an IP access list or OGACL by name or number. |
| object-group network | Defines network object groups for use in OGACLs. |
| object-group service | Defines service object groups for use in OGACLs. |
| permit | Sets conditions in a named IP access list or OGACL that will permit packets. |
| show object-group | Displays information about object groups that are configured. |
| show run interfaces cable | Displays statistics on the cable modem. |

show ip dhcp snooping statistics

To display DHCP snooping statistics in summary or detail form, use the **show ip dhcp snooping statistics** command in user EXEC or privileged EXEC mode.

show ip dhcp snooping statistics [**detail**]

| Syntax Description | detail (Optional) Displays detailed statistics information. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Command Modes | User EXEC (>) Privileged EXEC (#) | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |
| Usage Guidelines | In a device stack, all statistics are generated on the stack's active switch. If a new active device is elected, the statistics counters reset. | | | | |

The following is sample output from the **show ip dhcp snooping statistics** command:

```
Device> show ip dhcp snooping statistics

Packets Forwarded                = 0
Packets Dropped                  = 0
Packets Dropped From untrusted ports = 0
```

The following is sample output from the **show ip dhcp snooping statistics detail** command:

```
Device> show ip dhcp snooping statistics detail

Packets Processed by DHCP Snooping          = 0
Packets Dropped Because
  IDB not known                             = 0
  Queue full                                = 0
  Interface is in errdisabled                = 0
  Rate limit exceeded                       = 0
  Received on untrusted ports                = 0
  Nonzero giaddr                             = 0
  Source mac not equal to chaddr             = 0
  Binding mismatch                           = 0
  Insertion of opt82 fail                    = 0
  Interface Down                             = 0
  Unknown output interface                   = 0
  Reply output port equal to input port      = 0
  Packet denied by platform                  = 0
```

This table shows the DHCP snooping statistics and their descriptions:

Table 202: DHCP Snooping Statistics

| DHCP Snooping Statistic | Description |
|---------------------------------------|--|
| Packets Processed by DHCP Snooping | Total number of packets handled by DHCP snooping, including forwarded and dropped packets. |
| Packets Dropped Because IDB not known | Number of errors when the input interface of the packet cannot be determined. |
| Queue full | Number of errors when an internal queue used to process the packets is full. This might happen if DHCP packets are received at an excessively high rate and rate limiting is not enabled on the ingress ports. |
| Interface is in errdisabled | Number of times a packet was received on a port that has been marked as error disabled. This might happen if packets are in the processing queue when a port is put into the error-disabled state and those packets are subsequently processed. |
| Rate limit exceeded | Number of times the rate limit configured on the port was exceeded and the interface was put into the error-disabled state. |
| Received on untrusted ports | Number of times a DHCP server packet (OFFER, ACK, NAK, or LEASEQUERY) was received on an untrusted port and was dropped. |
| Nonzero giaddr | Number of times the relay agent address field (giaddr) in the DHCP packet received on an untrusted port was not zero, or the no ip dhcp snooping information option allow-untrusted global configuration command is not configured and a packet received on an untrusted port contained option-82 data. |
| Source mac not equal to chaddr | Number of times the client MAC address field of the DHCP packet (chaddr) does not match the packet source MAC address and the ip dhcp snooping verify mac-address global configuration command is configured. |
| Binding mismatch | Number of times a RELEASE or DECLINE packet was received on a port that is different than the port in the binding for that MAC address-VLAN pair. This indicates someone might be trying to spoof the real client, or it could mean that the client has moved to another port on the device and issued a RELEASE or DECLINE. The MAC address is taken from the chaddr field of the DHCP packet, not the source MAC address in the Ethernet header. |
| Insertion of opt82 fail | Number of times the option-82 insertion into a packet failed. The insertion might fail if the packet with the option-82 data exceeds the size of a single physical packet on the internet. |

| DHCP Snooping Statistic | Description |
|---------------------------------------|---|
| Interface Down | Number of times the packet is a reply to the DHCP relay agent, but the SVI interface for the relay agent is down. This is an unlikely error that occurs if the SVI goes down between sending the client request to the DHCP server and receiving the response. |
| Unknown output interface | Number of times the output interface for a DHCP reply packet cannot be determined by either option-82 data or a lookup in the MAC address table. The packet is dropped. This can happen if option 82 is not used and the client MAC address has aged out. If IPSG is enabled with the port-security option and option 82 is not enabled, the MAC address of the client is not learned, and the reply packets will be dropped. |
| Reply output port equal to input port | Number of times the output port for a DHCP reply packet is the same as the input port, causing a possible loop. Indicates a possible network misconfiguration or misuse of trust settings on ports. |
| Packet denied by platform | Number of times the packet has been denied by a platform-specific registry. |

show radius server-group

To display properties for the RADIUS server group, use the **show radius server-group** command in user EXEC or privileged EXEC mode.

```
show radius server-group {name | all}
```

Syntax Description

| | |
|-------------|--|
| <i>name</i> | Name of the server group. The character string used to name the group of servers must be defined using the aaa group server radius command. |
| all | Displays properties for all of the server groups. |

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Use the **show radius server-group** command to display the server groups that you defined by using the **aaa group server radius** command.

The following is sample output from the **show radius server-group all** command:

```
Device# show radius server-group all

Server group radius
  Sharecount = 1   sg_unconfigured = FALSE
  Type = standard Memlocks = 1
```

This table describes the significant fields shown in the display.

Table 203: show radius server-group command Field Descriptions

| Field | Description |
|-----------------|---|
| Server group | Name of the server group. |
| Sharecount | Number of method lists that are sharing this server group. For example, if one method list uses a particular server group, the sharecount would be 1. If two method lists use the same server group, the sharecount would be 2. |
| sg_unconfigured | Server group has been unconfigured. |

| Field | Description |
|----------|---|
| Type | The type can be either standard or nonstandard. The type indicates whether the servers in the group accept nonstandard attributes. If all servers within the group are configured with the nonstandard option, the type will be shown as "nonstandard". |
| Memlocks | An internal reference count for the server-group structure that is in memory. The number represents how many internal data structure packets or transactions are holding references to this server group. Memlocks is used internally for memory management purposes. |

show tech-support acl

To display access control list (ACL)-related information for technical support, use the **show tech-support acl** command in privileged EXEC mode.

show tech-support acl

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.11.1 | |

Usage Guidelines The output of the **show tech-support acl** command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support acl | redirect flash:show_tech_acl.txt**) in the local writable storage file system or remote file system.

The output of this command displays the following commands:

Note On stackable platforms, these commands are executed on every switch in the stack. On modular platforms, like Catalyst 9400 Series Switches, these commands are run only on the active switch.

Note The following list of commands is a sample of the commands available in the output; these may differ based on the platform.

- **show clock**
- **show version**
- **show running-config**
- **show module**
- **show interface**
- **show access-lists**
- **show logging**
- **show platform software fed switch *switch-number* acl counters hardware**
- **show platform software fed switch *switch-number* ifm mapping**
- **show platform hardware fed switch *switch-number* fwd-asic drops exceptions**
- **show platform software fed switch *switch-number* acl info**

- **show platform software fed switch *switch-number* acl**
- **show platform software fed switch *switch-number* acl usage**
- **show platform software fed switch *switch-number* acl policy intftype all cam**
- **show platform software fed switch *switch-number* acl cam brief**
- **show platform software fed switch *switch-number* acl policy intftype all vcu**
- **show platform hardware fed switch *switch-number* acl resource usage**
- **show platform hardware fed switch *switch-number* fwd-asic resource tcam table acl**
- **show platform hardware fed switch *switch-number* fwd-asic resource tcam utilization**
- **show platform software fed switch *switch-number* acl counters hardware**
- **show platform software classification switch *switch-number* all F0 class-group-manager class-group**
- **show platform software process database forwarding-manager switch *switch-number* R0 summary**
- **show platform software process database forwarding-manager switch *switch-number* F0 summary**
- **show platform software object-manager switch *switch-number* F0 pending-ack-update**
- **show platform software object-manager switch *switch-number* F0 pending-issue-update**
- **show platform software object-manager switch *switch-number* F0 error-object**
- **show platform software peer forwarding-manager switch *switch-number* F0**
- **show platform software access-list switch *switch-number* f0 statistics**
- **show platform software access-list switch *switch-number* r0 statistics**
- **show platform software trace message fed switch *switch-number***
- **show platform software trace message forwarding-manager switch *switch-number* F0**
- **show platform software trace message forwarding-manager switch R0 *switch-number* R0**

Examples

The following is sample output from the **show tech-support acl** command:

```
Device# show tech-support acl
.
.
.
----- show platform software fed switch 1 acl cam brief -----

show tech-support identity

To display identity/802.1x-related information for technical support, use the **show tech-support identity** command in privileged EXEC mode.

show tech-support identity mac *mac-address* **interface** *interface-name*

| | | |
|---------------------------|--|--|
| Syntax Description | mac <i>mac-address</i> | Displays information about the client MAC address. |
| | interface <i>interface-name</i> | Displays information about the client interface. |
| Command Modes | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.11.1 | |

Usage Guidelines

The output of the **show tech-support platform** command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support identity mac** *mac-address* **interface** *interface-name* | **redirect flash:filename**) in the local writable storage file system or remote file system.

The output of this command displays the following commands:

- **show clock**
- **show module**
- **show version**
- **show switch**
- **show redundancy**
- **show dot1x statistics**
- **show ip access-lists**
- **show interface**
- **show ip interface brief**
- **show vlan brief**
- **show running-config**
- **show logging**
- **show interface controller**
- **show platform authentication sbinf interface**

- **show platform host-access-table**
- **show platform pm port-data**
- **show spanning-tree interface**
- **show access-session mac detail**
- **show platform authentication session mac**
- **show device-tracking database mac details**
- **show mac address-table address**
- **show access-session event-logging mac**
- **show authentication sessions mac details R0**
- **show ip admission cache R0**
- **show platform software wired-client R0**
- **show platform software wired-client F0**
- **show platform software process database forwarding-manager R0 summary**
- **show platform software process database forwarding-manager F0 summary**
- **show platform software object-manager F0 pending-ack-update**
- **show platform software object-manager F0 pending-issue-update**
- **show platform software object-manager F0 error-object**
- **show platform software peer forwarding-manager R0**
- **show platform software peer forwarding-manager F0**
- **show platform software VP R0 summary**
- **show platform software VP F0 summary**
- **show platform software fed punt cpuq**
- **show platform software fed punt cause summary**
- **show platform software fed inject cause summary**
- **show platform hardware fed fwd-asic drops exceptions**
- **show platform hardware fed fwd-asic resource tcam table acl**
- **show platform software fed acl counter hardware**
- **show platform software fed matm macTable**
- **show platform software fed ifm mappings**
- **show platform software trace message fed reverse**
- **show platform software trace message forwarding-manager R0 reverse**
- **show platform software trace message forwarding-manager F0 reverse**

- show platform software trace message smd R0 reverse
- show authentication sessions mac details
- show platform software wired-client
- show platform software process database forwarding-manager summary
- show platform software object-manager pending-ack-update
- show platform software object-manager pending-issue-update
- show platform software object-manager error-object
- show platform software peer forwarding-manager
- show platform software VP summary
- show platform software trace message forwarding-manager reverse
- show ip admission cache
- show platform software trace message smd reverse

show vlan access-map

To display information about a particular VLAN access map or for all VLAN access maps, use the **show vlan access-map** command in privileged EXEC mode.

show vlan access-map [*map-name*]

| | |
|---------------------------|--|
| Syntax Description | <i>map-name</i> (Optional) Name of a specific VLAN access map. |
|---------------------------|--|

| | |
|----------------------|---------------------|
| Command Modes | Privileged EXEC (#) |
|----------------------|---------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output from the **show vlan access-map** command:

```
Device# show vlan access-map

Vlan access-map "vmap4" 10
  Match clauses:
    ip address: a12
  Action:
    forward
Vlan access-map "vmap4" 20
  Match clauses:
    ip address: a12
  Action:
    forward
```

show vlan filter

To display information about all VLAN filters or about a particular VLAN or VLAN access map, use the **show vlan filter** command in privileged EXEC mode.

```
show vlan filter {access-map name | vlan vlan-id}
```

Syntax Description

access-map *name* (Optional) Displays filtering information for the specified VLAN access map.

vlan *vlan-id* (Optional) Displays filtering information for the specified VLAN. The range is 1 to 4094.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

The following is sample output from the **show vlan filter** command:

```
Device# show vlan filter
VLAN Map map_1 is filtering VLANs:
 20-22
```

show vlan group

To display the VLANs that are mapped to VLAN groups, use the **show vlan group** command in privileged EXEC mode.

```
show vlan group [{group-name vlan-group-name [user_count]}]
```

| Syntax Description | group-name | vlan-group-name | (Optional) Displays the VLANs mapped to the specified VLAN group. |
|--------------------|------------|-----------------|--|
| | user_count | | (Optional) Displays the number of users in each VLAN mapped to a specified VLAN group. |

| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|
|---------------|---------------------|

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **show vlan group** command displays the existing VLAN groups and lists the VLANs and VLAN ranges that are members of each VLAN group. If you enter the **group-name** keyword, only the members of the specified VLAN group are displayed.

Examples

This example shows how to display the members of a specified VLAN group:

```
Device# show vlan group group-name group2
vlan group group1 :40-45
```

This example shows how to display number of users in each of the VLANs in a group:

```
Device# show vlan group group-name group2 user_count

VLAN      : Count
-----
40         : 5
41         : 8
42         : 12
43         : 2
44         : 9
45         : 0
```

ssci-based-on-sci

To compute the Short Secure Channel Identifier (SSCI) value based on the Secure Channel Identifier (SCI) value, use the **ssci-based-on-sci** command in MKA-policy configuration mode. To disable SSCI computation based on SCI, use the **no** form of this command.

ssci-based-on-sci
no ssci-based-on-sci

Syntax Description

This command has no arguments or keywords.

Command Default

SSCI value computation based on SCI value is disabled.

Command Modes

MKA-policy configuration (config-mka-policy)

Command History

| Release | Modification |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.3 | This command was introduced. |

Usage Guidelines

The higher the SCI value, the lower is the SSCI value.

Examples

The following example shows how to enable the SSCI computation based on SCI:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# ssci-based-on-sci
```

Related Commands

| Command | Description |
|----------------------------------|--|
| mka policy | Configures an MKA policy. |
| confidentiality-offset | Sets the confidentiality offset for MACsec operations. |
| delay-protection | Configures MKA to use delay protection in sending MKPDU. |
| include-icv-indicator | Includes ICV indicator in MKPDU. |
| key-server | Configures MKA key-server options. |
| macsec-cipher-suite | Configures cipher suite for deriving SAK. |
| sak-rekey | Configures the SAK rekey interval. |
| send-secure-announcements | Configures MKA to send secure announcements in sending MKPDUs. |
| use-updated-eth-header | Uses the updated Ethernet header for ICV calculation. |

switchport port-security aging

To set the aging time and type for secure address entries or to change the aging behavior for secure addresses on a particular port, use the **switchport port-security aging** command in interface configuration mode. To disable port security aging or to set the parameters to their default states, use the **no** form of this command.

```
switchport port-security aging {static | time time | type {absolute | inactivity}}
no switchport port-security aging {static | time | type}
```

| Syntax Description | |
|----------------------------|--|
| static | Enables aging for statically configured secure addresses on this port. |
| time <i>time</i> | Specifies the aging time for this port. The range is 0 to 1440 minutes. If the time is 0, aging is disabled for this port. |
| type | Sets the aging type. |
| absolute | Sets absolute aging type. All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list. |
| inactivity | Sets the inactivity aging type. The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period. |

Command Default

The port security aging feature is disabled. The default time is 0 minutes.

The default aging type is absolute.

The default static aging behavior is disabled.

Command Modes

Interface configuration (config-if)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

To enable secure address aging for a particular port, set the aging time to a value other than 0 for that port.

To allow limited time access to particular secure addresses, set the aging type as **absolute**. When the aging time lapses, the secure addresses are deleted.

To allow continuous access to a limited number of secure addresses, set the aging type as **inactivity**. This removes the secure address when it become inactive, and other addresses can become secure.

To allow unlimited access to a secure address, configure it as a secure address, and disable aging for the statically configured secure address by using the **no switchport port-security aging static** interface configuration command.

This example sets the aging time as 2 hours for absolute aging for all the secure addresses on the port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# switchport port-security aging time 120
```

```
Device(config-if)# end
```

This example sets the aging time as 2 minutes for inactivity aging type with aging enabled for configured secure addresses on the port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport port-security aging time 2
Device(config-if)# switchport port-security aging type inactivity
Device(config-if)# switchport port-security aging static
Device(config-if)# end
```

This example shows how to disable aging for configured secure addresses:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# no switchport port-security aging static
Device(config-if)# end
```

switchport port-security mac-address

To configure secure MAC addresses or sticky MAC address learning, use the **switchport port-security mac-address** interface configuration command. To return to the default setting, use the **no** form of this command.

```
switchport port-security mac-address {mac-address [{vlan {vlan-id {access | voice}}]} | sticky
[{mac-address | vlan {vlan-id {access | voice}}]}]
no switchport port-security mac-address {mac-address [{vlan {vlan-id {access | voice}}]} | sticky
[{mac-address | vlan {vlan-id {access | voice}}]}]
```

Syntax Description

mac-address A secure MAC address for the interface by entering a 48-bit MAC address. You can add additional secure MAC addresses up to the maximum value configured.

vlan vlan-id (Optional) On a trunk port only, specifies the VLAN ID and the MAC address. If no VLAN ID is specified, the native VLAN is used.

vlan access (Optional) On an access port only, specifies the VLAN as an access VLAN.

vlan voice (Optional) On an access port only, specifies the VLAN as a voice VLAN.

Note The **voice** keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.

sticky Enables the interface for sticky learning. When sticky learning is enabled, the interface adds all secure MAC addresses that are dynamically learned to the running configuration and converts these addresses to sticky secure MAC addresses.

mac-address (Optional) A MAC address to specify a sticky secure MAC address.

Command Default

No secure MAC addresses are configured.
Sticky learning is disabled.

Command Modes

Interface configuration (config-if)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Gigabit or 10-Gigabit EtherChannel port group.

- You cannot configure static secure or sticky secure MAC addresses in the voice VLAN.
- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.
- Voice VLAN is supported only on access ports and not on trunk ports.

Sticky secure MAC addresses have these characteristics:

- When you enable sticky learning on an interface by using the **switchport port-security mac-address sticky** interface configuration command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses and adds all sticky secure MAC addresses to the running configuration.
- If you disable sticky learning by using the **no switchport port-security mac-address sticky** interface configuration command or the running configuration is removed, the sticky secure MAC addresses remain part of the running configuration but are removed from the address table. The addresses that were removed can be dynamically reconfigured and added to the address table as dynamic addresses.
- When you configure sticky secure MAC addresses by using the **switchport port-security mac-address sticky mac-address** interface configuration command, these addresses are added to the address table and the running configuration. If port security is disabled, the sticky secure MAC addresses remain in the running configuration.
- If you save the sticky secure MAC addresses in the configuration file, when the device restarts or the interface shuts down, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost. If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.
- If you disable sticky learning and enter the **switchport port-security mac-address sticky mac-address** interface configuration command, an error message appears, and the sticky secure MAC address is not added to the running configuration.

You can verify your settings by using the **show port-security** command.

This example shows how to configure a secure MAC address and a VLAN ID on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport mode trunk
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security mac-address 1000.2000.3000 vlan 3
Device(config-if)# end
```

This example shows how to enable sticky learning and to enter two sticky secure MAC addresses on a port:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport port-security mac-address sticky
Device(config-if)# switchport port-security mac-address sticky 0000.0000.4141
```

```
Device(config-if)# switchport port-security mac-address sticky 0000.0000.000f  
Device(config-if)# end
```

switchport port-security maximum

To configure the maximum number of secure MAC addresses, use the **switchport port-security maximum** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

```
switchport port-security maximum value [vlan [{vlan-list} | [{access | voice}]]]
no switchport port-security maximum value [vlan [{vlan-list} | [{access | voice}]]]
```

Syntax Description

value Sets the maximum number of secure MAC addresses for the interface.
The default setting is 1.

vlan (Optional) For trunk ports, sets the maximum number of secure MAC addresses on a VLAN or range of VLANs. If the **vlan** keyword is not entered, the default value is used.

vlan-list (Optional) Range of VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.

access (Optional) On an access port only, specifies the VLAN as an access VLAN.

voice (Optional) On an access port only, specifies the VLAN as a voice VLAN.

Note The **voice** keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.

Command Default

When port security is enabled and no keywords are entered, the default maximum number of secure MAC addresses is 1.

Command Modes

Interface configuration (config-if)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The maximum number of secure MAC addresses that you can configure on a device is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. See the **sdm prefer** command. This number represents the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel or 10-Gigabit EtherChannel port group.

- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.

Voice VLAN is supported only on access ports and not on trunk ports.

- When you enter a maximum secure address value for an interface, if the new value is greater than the previous value, the new value overrides the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

Setting a maximum number of addresses to one and configuring the MAC address of an attached device ensures that the device has the full bandwidth of the port.

When you enter a maximum secure address value for an interface, this occurs:

- If the new value is greater than the previous value, the new value overrides the previously configured value.
- If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

You can verify your settings by using the **show port-security** command.

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport mode access
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 5
Device(config-if)# end
```

switchport port-security violation

To configure secure MAC address violation mode or the action to be taken if port security is violated, use the **switchport port-security violation** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

```
switchport port-security violation {protect | restrict | shutdown | shutdown vlan}
no switchport port-security violation {protect | restrict | shutdown | shutdown vlan}
```

| Syntax Description | protect | Sets the security violation protect mode. |
|--------------------|---|--|
| | restrict | Sets the security violation restrict mode. |
| | shutdown | Sets the security violation shutdown mode. |
| | shutdown vlan | Sets the security violation mode to per-VLAN shutdown. |
| Command Default | The default violation mode is shutdown . | |
| Command Modes | Interface configuration (config-if) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines In the security violation protect mode, when the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

Note We do not recommend configuring the protect mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

In the security violation restrict mode, when the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

In the security violation shutdown mode, the interface is error-disabled when a violation occurs and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments. When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause psecure-violation** global configuration command, or you can manually re-enable it by entering the **shutdown** and **no shutdown** interface configuration commands.

When the security violation mode is set to per-VLAN shutdown, only the VLAN on which the violation occurred is error-disabled.

A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel or 10-Gigabit EtherChannel port group.

A security violation occurs when the maximum number of secure MAC addresses are in the address table and a station whose MAC address is not in the address table attempts to access the interface or when a station whose MAC address is configured as a secure MAC address on another secure port attempts to access the interface.

When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause psecure-violation** global configuration command. You can manually re-enable the port by entering the **shutdown** and **no shutdown** interface configuration commands or by using the **clear errdisable interface** privileged EXEC command.

You can verify your settings by using the **show port-security** privileged EXEC command.

This example shows how to configure a port to shut down only the VLAN if a MAC security violation occurs:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/2
Device(config)# switchport port-security violation shutdown vlan
Device(config)# exit
```

tacacs server

To configure the TACACS+ server for IPv6 or IPv4 and enter TACACS+ server configuration mode, use the **tacacs server** command in global configuration mode. To remove the configuration, use the **no** form of this command.

```
tacacs server name
no tacacs server
```

| | |
|---------------------------|--|
| Syntax Description | <i>name</i> Name of the private TACACS+ server host. |
|---------------------------|--|

Command Default No TACACS+ server is configured.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **tacacs server** command configures the TACACS server using the *name* argument and enters TACACS+ server configuration mode. The configuration is applied once you have finished configuration and exited TACACS+ server configuration mode.

Examples The following example shows how to configure the TACACS server using the name server1 and enter TACACS+ server configuration mode to perform further configuration:

```
Device> enable
Device# configure terminal
Device(config)# tacacs server server1
Device(config-server-tacacs) # end
```

| Related Commands | Command | Description |
|-------------------------|------------------------------------|---|
| | address ipv6 (TACACS+) | Configures the IPv6 address of the TACACS+ server. |
| | key (TACACS+) | Configures the per-server encryption key on the TACACS+ server. |
| | port (TACACS+) | Specifies the TCP port to be used for TACACS+ connections. |
| | send-nat-address (TACACS+) | Sends a client's post-NAT address to the TACACS+ server. |
| | single-connection (TACACS+) | Enables all TACACS packets to be sent to the same server using a single TCP connection. |
| | timeout(TACACS+) | Configures the time to wait for a reply from the specified TACACS server. |

tls

To configure Transport Layer Security (TLS) parameters, use the **tls** command in radius server configuration mode. To return to the default setting, use the **no** form of this command.

```
tls [{ connectiontimeout connection-timeout-value | idletimeout idle-timeout-value | [{ ip | ipv6 }] {
radius source-interface interface-name | vrf forwarding forwarding-table-name } | match-server-identity
{ email-address email-address | hostname hostname | ip-address ip-address } | port port-number |
retries number-of-connection-retries | trustpoint { client trustpoint name | server trustpoint name } |
watchdoginterval interval }]
```

no **tls**

Syntax Description

| | |
|---|---|
| connectiontimeout <i>connection-timeout-value</i> | (Optional) Configures the DTLS connection timeout value. |
| idletimeout <i>idle-timeout-value</i> | (Optional) Configures the DTLS idle timeout value. |
| [ip ipv6] { radius source-interface <i>interface-name</i> vrf forwarding <i>forwarding-table-name</i> } | (Optional) Configures IP or IPv6 source parameters. |
| match-server-identity { email-address <i>email-address</i> hostname <i>host-name</i> ip-address <i>ip-address</i> } | Configures RadSec certification validation parameters. |
| port <i>port-number</i> | (Optional) Configures the DTLS port number. |
| retries <i>number-of-connection-retries</i> | (Optional) Configures the number of DTLS connection retries. |
| trustpoint { client <i>trustpoint name</i> server <i>trustpoint name</i> } | (Optional) Configures the DTLS trustpoint for the client and the server. |
| watchdoginterval <i>interval</i> | (Optional) Configures the watchdog interval. This enables CoA requests to be received on the same authentication channel. It also serves as keepalive to keep the TLS tunnel up, and re-establishes the tunnel if it is torn down. Note watchdoginterval value must be lesser than idletimeout for the established tunnel to remain up. |

Command Default

- The default value of TLS connection timeout is 5 seconds.
- The default value of TLS idle timeout is 60 seconds.
- The default TLS port number is 2083.
- The default value of TLS connection retries is 5.
- The default value of watchdog interval is 0.

Command Modes Radius server configuration mode (config-radius-server)

| Command History | Release | Modification |
|-----------------|-------------------------------|---|
| | Cisco IOS XE Bengaluru 17.4.1 | This command was introduced. |
| | Cisco IOS XE Bengaluru 17.6.1 | The watchdoginterval keyword was introduced. |

Usage Guidelines We recommend that you use the same server type, either only TLS or only Datagram Transport Layer Security (DTLS), under a authentication, authorization, and accounting (AAA) server group.

Examples

The following example shows how to configure the TLS idle timeout value to 5 seconds:

```
Device> enable
Device# configure terminal
Device(config)# radius server R1
Device(config-radius-server)# tls idletimeout 5
Device(config-radius-server)# end
```

| Related Commands | Command | Description |
|------------------|--|---|
| | show aaa servers | Displays information related to the TLS server. |
| | clear aaa counters servers radius | Clears the RADIUS TLS-specific statistics. |
| | debug radius radsec | Enables RADIUS TLS-specific debugs. |

tracking (IPv6 snooping)

To override the default tracking policy on a port, use the **tracking** command in IPv6 snooping policy configuration mode.

tracking {**enable** [**reachable-lifetime** {*value* | **infinite**}] | **disable** [**stale-lifetime** {*value* | **infinite**}]}

| Syntax Description | | |
|---------------------------|--|---|
| enable | | Enables tracking. |
| reachable-lifetime | | (Optional) Specifies the maximum amount of time a reachable entry is considered to be directly or indirectly reachable without proof of reachability. <ul style="list-style-type: none"> The reachable-lifetime keyword can be used only with the enable keyword. Use of the reachable-lifetime keyword overrides the global reachable lifetime configured by the ipv6 neighbor binding reachable-lifetime command. |
| <i>value</i> | | Lifetime value, in seconds. The range is from 1 to 86400, and the default is 300. |
| infinite | | Keeps an entry in a reachable or stale state for an infinite amount of time. |
| disable | | Disables tracking. |
| stale-lifetime | | (Optional) Keeps the time entry in a stale state, which overwrites the global stale-lifetime configuration. <ul style="list-style-type: none"> The stale lifetime is 86,400 seconds. The stale-lifetime keyword can be used only with the disable keyword. Use of the stale-lifetime keyword overrides the global stale lifetime configured by the ipv6 neighbor binding stale-lifetime command. |
| Command Default | The time entry is kept in a reachable state. | |
| Command Modes | IPv6 snooping configuration (config-ipv6-snooping) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **tracking** command overrides the default tracking policy set by the **ipv6 neighbor tracking** command on the port on which this policy applies. This function is useful on trusted ports where, for example, you may not want to track entries but want an entry to stay in the binding table to prevent it from being stolen.

The **reachable-lifetime** keyword is the maximum time an entry will be considered reachable without proof of reachability, either directly through tracking or indirectly through IPv6 snooping. After the **reachable-lifetime** value is reached, the entry is moved to stale. Use of the **reachable-lifetime** keyword with the tracking command overrides the global reachable lifetime configured by the **ipv6 neighbor binding reachable-lifetime** command.

The **stale-lifetime** keyword is the maximum time an entry is kept in the table before it is deleted or the entry is proven to be reachable, either directly or indirectly. Use of the **reachable-lifetime** keyword with the **tracking** command overrides the global stale lifetime configured by the **ipv6 neighbor binding stale-lifetime** command.

This example shows how to define an IPv6 snooping policy name as policy1 and configures an entry to stay in the binding table for an infinite length of time on a trusted port:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# tracking disable stale-lifetime infinite
Device(config-ipv6-snooping)# end
```

trusted-port

To configure a port to become a trusted port, use the **trusted-port** command in IPv6 snooping policy mode or ND inspection policy configuration mode. To disable this function, use the **no** form of this command.

trusted-port
no trusted-port

Syntax Description

This command has no arguments or keywords.

Command Default

No ports are trusted.

Command Modes

ND inspection policy configuration (config-nd-inspection)
 IPv6 snooping configuration (config-ipv6-snooping)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

When the **trusted-port** command is enabled, limited or no verification is performed when messages are received on ports that have this policy. However, to protect against address spoofing, messages are analyzed so that the binding information that they carry can be used to maintain the binding table. Bindings discovered from these ports will be considered more trustworthy than bindings received from ports that are not configured to be trusted.

This example shows how to define an NDP policy name as policy1, and configures the port to be trusted:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 nd inspection policy1
Device(config-nd-inspection)# trusted-port
Device(config-nd-inspection)# end
```

This example shows how to define an IPv6 snooping policy name as policy1, and configures the port to be trusted:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# trusted-port
Device(config-ipv6-snooping)# end
```

use-updated-eth-header

To enable interoperability between devices and any port on a device that includes the updated Ethernet header in MACsec Key Agreement Protocol Data Units (MKPDUs) for integrity check value (ICV) calculation, use the **ssci-based-on-sci** command in MKA-policy configuration mode. To disable the updated ethernet header in MKPDUs for ICV calculation, use the **no** form of this command.

use-updated-eth-header

no use-updated-eth-header

Syntax Description

This command has no arguments or keywords.

Command Default

The Ethernet header for ICV calculation is disabled.

Command Modes

MKA-policy configuration (config-mka-policy)

Command History

| Release | Modification |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.12.1 | This command was introduced. |

Usage Guidelines

The updated Ethernet header is non-standard. Enabling this option ensures that an MACsec Key Agreement (MKA) session between the devices can be set up.

Examples

The following example shows how to enable the updated Ethernet header in MKPDUs for ICV calculation:

```
Device> enable
Device# configure terminal
Device(config)# mka policy 2
Device(config-mka-policy)# use-updated-eth-header
```

Related Commands

| Command | Description |
|----------------------------------|--|
| mka policy | Configures an MKA policy. |
| confidentiality-offset | Sets the confidentiality offset for MACsec operations. |
| delay-protection | Configures MKA to use delay protection in sending MKPDU. |
| include-icv-indicator | Includes ICV indicator in MKPDU. |
| key-server | Configures MKA key-server options. |
| macsec-cipher-suite | Configures cipher suite for deriving SAK. |
| sak-rekey | Configures the SAK rekey interval. |
| send-secure-announcements | Configures MKA to send secure announcements in sending MKPDUs. |
| ssci-based-on-sci | Computes SSCI based on the SCI. |

username

To establish the username-based authentication system, use the **username** command in global configuration mode. To remove an established username-based authentication, use the **no** form of this command.

```
username name [aaa attribute list aaa-list-name]
username name [access-class access-list-number]
username name [algorithm-type { md5 { secret | masked-secret } | crypt { secret | masked-secret } | sha256 { secret | masked-secret } }]
username name [autocommand command]
username name [callback-dialstring telephone-number]
username name [callback-line [tty ]line-number [ending-line-number]]
username name [callback-rotary rotary-group-number]
username name [common-criteria-policy policy-name]
username name [dnis]
username name [mac]
username name [nocallback-verify]
username name [noescape]
username name [nohangup]
username name [{ nopassword | password password | password encryption-type encrypted-password}]
username name [one-time {password {0 | 6 | 7 | password} | secret {0 | 5 | 8 | 9 | password}}]
username name [password secret]
username name [privilege level]
username name [secret {0 | 5 | password}]
username name [serial-number]
username name [user-maxlinks number]
username name [view view-name]
no username name
```

Syntax Description

| | |
|---|---|
| <i>name</i> | Hostname, server name, user ID, or command name. The <i>name</i> argument can be only one word. Blank spaces and quotation marks are not allowed. |
| aaa attribute list <i>aaa-list-name</i> | (Optional) Uses the specified authentication, authorization, and accounting (AAA) method list. |
| access-class <i>access-list-number</i> | (Optional) Specifies an outgoing access list that overrides the access list specified in the access-class command that is available in line configuration mode. It is used for the duration of the user's session. |
| algorithm-type | (Optional) Specifies the algorithm to use for hashing the plaintext secret for the user. <ul style="list-style-type: none"> • md5: Encodes the password using the MD5 algorithm. • crypt: Encodes the password using the SCRYPT hashing algorithm. • sha256: Encodes the password using the PBKDF2 hashing algorithm. • secret: Specifies the secret for the user. • masked-secret: Masks the secret input and converts to the selected encryption. |

| | |
|---|--|
| autocommand <i>command</i> | (Optional) Causes the specified autocommand command to be issued automatically after the user logs in. When the specified autocommand command is complete, the session is terminated. Because the command can be of any length and can contain embedded spaces, commands using the autocommand keyword must be the last option on the line. |
| callback-dialstring <i>telephone-number</i> | (Optional) Permits you to specify a telephone number to pass to the Data Circuit-terminating Equipment (DCE) device; for asynchronous callback only. |
| callback-line <i>line-number</i> | (Optional) Specifies relative number of the terminal line (or the first line in a contiguous group) on which you enable a specific username for callback; for asynchronous callback only. Numbering begins with zero. |
| <i>ending-line-number</i> | (Optional) Relative number of the last line in a contiguous group on which you want to enable a specific username for callback. If you omit the keyword (such as tty), then line number and ending line number are absolute rather than relative line numbers. |
| tty | (Optional) Specifies standard asynchronous line; for asynchronous callback only. |
| callback-rotary <i>rotary-group-number</i> | (Optional) Permits you to specify a rotary group number on which you want to enable a specific username for callback; for asynchronous callback only. The next available line in the rotary group is selected. Range: 1 to 100. |
| common-criteria-policy | (Optional) Specifies the name of the common criteria policy. |
| dnis | (Optional) Does not require a password when obtained through the Dialed Number Identification Service (DNIS). |
| mac | (Optional) Allows a MAC address to be used as the username for MAC filtering done locally. |
| nocallback-verify | (Optional) Specifies that authentication is not required for EXEC callback on the specified line. |
| noescape | (Optional) Prevents the user from using an escape character on the host to which that user is connected. |
| nohangup | (Optional) Prevents Cisco IOS software from disconnecting the user after an automatic command (set up with the autocommand keyword) is run. Instead, the user gets another user EXEC prompt. |
| nopassword | (Optional) No password is required for the user to log in. This is usually the most useful keyword to use in combination with the autocommand keyword. |
| password | (Optional) Specifies a password to access the <i>name</i> argument. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the username command. |
| <i>password</i> | Password that the user enters. |

| | |
|---|--|
| <i>encryption-type</i> | Single-digit number that defines whether the text immediately following the password is encrypted, and if so, what type of encryption is used. Defined encryption types are 0, which means that the text immediately following the password is not encrypted, and 6 and 7, which means that the text is encrypted using a Cisco-defined encryption algorithm. |
| <i>encrypted-password</i> | Encrypted password that the user enters. |
| one-time | (Optional) Specifies that the username and password is valid for only one time. This configuration is used to prevent default credentials from remaining in user configurations. <ul style="list-style-type: none"> • 0: Specifies that an unencrypted password or secret (depending on the configuration) follows. • 6: Specifies that an encrypt password follows. • 7: Specifies that a hidden password follows. • 5: Specifies that a MD5 HASHED secret follows. • 8: Specifies that a PBKDF2 HASHED secret follows. • 9: Specifies that a SCRYPT HASHED secret follows. |
| secret | (Optional) Specifies a secret for the user. |
| <i>secret</i> | For Challenge Handshake Authentication Protocol (CHAP) authentication. Specifies the secret for the local device or the remote device. The secret is encrypted when it is stored on the local device. The secret can consist of any string of up to 11 ASCII characters. There is no limit to the number of username and password combinations that can be specified, allowing any number of remote devices to be authenticated. |
| privilege <i>privilege-level</i> | (Optional) Sets the privilege level for the user. Range: 1 to 15. |
| serial-number | (Optional) Specifies the serial number. |
| user-maxlinks <i>number</i> | (Optional) Specifies the maximum number of inbound links allowed for the user. |
| view <i>view-name</i> | (Optional) Associates a CLI view name, which is specified with the parser view command, with the local AAA database; for CLI view only. |

Command Default No username-based authentication system is established.

Command Modes Global configuration (config)

Command History

| Release | Modifica |
|-----------------------------|-----------------------|
| Cisco IOS XE Everest 16.6.1 | This com introduce |
| Cisco IOS XE Dublin 17.10.1 | The mas keyword |

Usage Guidelines

The **username** command provides username or password authentication, or both, for login purposes only.

Multiple **username** commands can be used to specify options for a single user.

Add a username entry for each remote system with which the local device communicates, and from which it requires authentication. The remote device must have a username entry for the local device. This entry must have the same password as the local device's entry for that remote device.

This command can be useful for defining usernames that get special treatment. For example, you can use this command to define an *info* username that does not require a password, but connects the user to a general purpose information service.

The **username** command is required as part of the configuration for CHAP. Add a username entry for each remote system from which the local device requires authentication.

To enable the local device to respond to remote CHAP challenges, one **username name** entry must be the same as the **hostname** entry that has already been assigned to the other device. To avoid the situation of a privilege level 1 user entering into a higher privilege level, configure a per-user privilege level other than 1, for example, 0 or 2 through 15. Per-user privilege levels override virtual terminal privilege levels.

CLI and Lawful Intercept Views

Both CLI views and lawful intercept views restrict access to specified commands and configuration information. A lawful intercept view allows the user to secure access to lawful intercept commands that are held within the TAP-MIB, which is a special set of SNMP commands that store information about calls and users.

Users who are specified via the **lawful-intercept** keyword are placed in the lawful-intercept view by default if no other privilege level or view name is explicitly specified.

If no value is specified for the *secret* argument, and the **debug serial-interface** command is enabled, an error is displayed when a link is established and the CHAP challenge is not implemented. The CHAP debugging information is available using the **debug ppp negotiation**, **debug serial-interface**, and **debug serial-packet** commands.

Examples

The following example shows how to implement a service similar to the UNIX **who** command, which can be entered at the login prompt, and lists the current users of the device:

```
Device> enable
Device# configure terminal
Device(config)# username who nopassword nohangup autocommand show users
```

The following example shows how to implement an information service that does not require a password to be used:

```
Device> enable
Device# configure terminal
Device(config)# username info nopassword noescape autocommand telnet nic.ddn.mil
```

The following example shows how to implement an ID that works even if all the TACACS+ servers break:

```
Device> enable
Device# configure terminal
Device(config)# username superuser password superpassword
```

The following example shows how to enable CHAP on interface serial 0 of server_1. It also defines a password for a remote server named server_r.

```
hostname server_1
username server_r password theirsystem
interface serial 0
  encapsulation ppp
  ppp authentication chap
```

The following is a sample output from the **show running-config** command displaying the passwords that are encrypted:

```
hostname server_1
username server_r password 7 121F0A18
interface serial 0
  encapsulation ppp
  ppp authentication chap
```

The following example shows how a privilege level 1 user is denied access to privilege levels higher than 1:

```
Device> enable
Device# configure terminal
Device(config)# username user privilege 0 password 0 cisco
Device(config)# username user2 privilege 2 password 0 cisco
```

The following example shows how to remove username-based authentication for user2:

```
Device> enable
Device# configure terminal
Device(config)# no username user2
```

The following example shows how to generate a type 8 (PBKDF2 with SHA-256) masked password:

```
Device> enable
Device# configure terminal
Device(config)# username user1 algorithm-type sha256 masked-secret
Enter secret: ****
Confirm secret: ****
Device(config)# show run | sec username
username user1 secret 8 $8$SmjcLxCNli8lGE$u.vFlaiPqJXBGFaQcEE1jsQ/YAxI/LdemF1LoAe3TM
```

Related Commands

| Command | Description |
|-------------------------------|---|
| debug ppp negotiation | Displays PPP packets sent during PPP startup, where PPP option |
| debug serial-interface | Displays information about a serial connection failure. |
| debug serial-packet | Displays more detailed serial interface debugging information than using the debug serial interface command. |

vlan access-map

To create or modify a VLAN map entry for VLAN packet filtering, and change the mode to the VLAN access-map configuration, use the **vlan access-map** command in global configuration mode on the device. To delete a VLAN map entry, use the **no** form of this command.

```
vlan access-map name [number]
no vlan access-map name [number]
```

| | | |
|---------------------------|--|------------------------------|
| Syntax Description | <p><i>name</i> Name of the VLAN map.</p> <hr/> <p><i>number</i> (Optional) The sequence number of the map entry that you want to create or modify (0 to 65535). If you are creating a VLAN map and the sequence number is not specified, it is automatically assigned in increments of 10, starting from 10. This number is the sequence to insert to, or delete from, a VLAN access-map entry.</p> | |
| Command Default | There are no VLAN map entries and no VLAN maps applied to a VLAN. | |
| Command Modes | Global configuration (config) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Usage Guidelines | <p>In global configuration mode, use this command to create or modify a VLAN map. This entry changes the mode to VLAN access-map configuration, where you can use the match access-map configuration command to specify the access lists for IP or non-IP traffic to match and use the action command to set whether a match causes the packet to be forwarded or dropped.</p> <p>In VLAN access-map configuration mode, these commands are available:</p> <ul style="list-style-type: none"> • action—Sets the action to be taken (forward or drop). • default—Sets a command to its defaults. • exit—Exits from VLAN access-map configuration mode. • match—Sets the values to match (IP address or MAC address). • no—Negates a command or set its defaults. <p>When you do not specify an entry number (sequence number), it is added to the end of the map.</p> <p>There can be only one VLAN map per VLAN and it is applied as packets are received by a VLAN.</p> <p>You can use the no vlan access-map name [number] command with a sequence number to delete a single entry.</p> <p>Use the vlan filter interface configuration command to apply a VLAN map to one or more VLANs.</p> | |
| Examples | <p>This example shows how to create a VLAN map named vac1 and apply matching conditions and actions to it. If no other entries already exist in the map, this will be entry 10.</p> | |

```
Device> enable
Device# configure terminal
Device(config)# vlan access-map vac1
Device(config-access-map)# match ip address acl1
Device(config-access-map)# action forward
Device(config-access-map)# end
```

This example shows how to delete VLAN map vac1:

```
Device> enable
Device# configure terminal
Device(config)# no vlan access-map vac1
Device(config)# exit
```

vlan dot1Q tag native

To enable dot1q (IEEE 802.1Q) tagging for a native VLAN on a trunk port, use the **vlan dot1Q tag native** command in global configuration mode.

To disable this function, use the **no** form of this command.

vlan dot1Q tag native
no vlan dot1Q tag native

Syntax Description This command has no arguments or keywords.

Command Default Disabled

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|------------------------------|------------------------------|
| | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

Usage Guidelines Typically, you configure 802.1Q trunks with a native VLAN ID which strips tagging from all packets on that VLAN.

To maintain the tagging on the native VLAN and drop untagged traffic, use the **vlan dot1q tag native** command. The device will tag the traffic received on the native VLAN and admit only 802.1Q-tagged frames, dropping any untagged traffic, including untagged traffic in the native VLAN.

Control traffic continues to be accepted as untagged on the native VLAN on a trunked port, even when the **vlan dot1q tag native** command is enabled.

Note If the **dot1q tag vlan native** command is configured at global level, dot1x reauthentication will fail on trunk ports.

This example shows how to enable dot1q (IEEE 802.1Q) tagging for native VLANs on all trunk ports on a device:

```
Device(config)# vlan dot1q tag native
Device(config)#
```

Related Commands

| Command | Description |
|-----------------------------------|--|
| show vlan dot1q tag native | Displays the status of tagging on the native VLAN. |

vlan filter

To apply a VLAN map to one or more VLANs, use the **vlan filter** command in global configuration mode. Use the **no** form of this command to remove the map.

```
vlan filter mapname vlan-list {list | all}
no vlan filter mapname vlan-list {list | all}
```

Syntax Description

| | |
|------------------|---|
| mapname | Name of the VLAN map entry. |
| vlan-list | Specifies which VLANs to apply the map to. |
| list | The list of one or more VLANs in the form tt, uu-vv, xx, yy-zz, where spaces around commas and dashes are optional. The range is 1 to 4094. |
| all | Adds the map to all VLANs. |

Command Default

There are no VLAN filters.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

To avoid accidentally dropping too many packets and disabling connectivity in the middle of the configuration process, we recommend that you completely define the VLAN access map before applying it to a VLAN.

Examples

This example applies VLAN map entry map1 to VLANs 20 and 30:

```
Device> enable
Device# configure terminal
Device(config)# vlan filter map1 vlan-list 20, 30
Device(config)# exit
```

This example shows how to delete VLAN map entry mac1 from VLAN 20:

```
Device> enable
Device# configure terminal
Device(config)# no vlan filter map1 vlan-list 20
Device(config)# exit
```

You can verify your settings by entering the **show vlan filter** command.

vlan group

To create or modify a VLAN group, use the **vlan group** command in global configuration mode. To remove a VLAN list from the VLAN group, use the **no** form of this command.

```
vlan group group-name vlan-list vlan-list
no vlan group group-name vlan-list vlan-list
```

Syntax Description

| | |
|-----------------------------------|--|
| <i>group-name</i> | Name of the VLAN group. The group name may contain up to 32 characters and must begin with a letter. |
| vlan-list <i>vlan-list</i> | Specifies one or more VLANs to be added to the VLAN group. The <i>vlan-list</i> argument can be a single VLAN ID, a list of VLAN IDs, or VLAN ID range. Multiple entries are separated by a hyphen (-) or a comma (,). |

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

If the named VLAN group does not exist, the **vlan group** command creates the group and maps the specified VLAN list to the group. If the named VLAN group exists, the specified VLAN list is mapped to the group.

The **no** form of the **vlan group** command removes the specified VLAN list from the VLAN group. When you remove the last VLAN from the VLAN group, the VLAN group is deleted.

A maximum of 100 VLAN groups can be configured, and a maximum of 4094 VLANs can be mapped to a VLAN group.

Examples

This example shows how to map VLANs 7 through 9 and 11 to a VLAN group:

```
Device> enable
Device# configure terminal
Device(config)# vlan group group1 vlan-list 7-9,11
Device(config)# exit
```

This example shows how to remove VLAN 7 from the VLAN group:

```
Device> enable
Device# configure terminal
Device(config)# no vlan group group1 vlan-list 7
Device(config)# exit
```

arp

To display the contents of the Address Resolution Protocol (ARP) table, use the **arp** command in boot loader mode.

arp [*ip_address*]

| | |
|---------------------------|--|
| Syntax Description | <i>ip_address</i> (Optional) Shows the ARP table or the mapping for a specific IP address. |
|---------------------------|--|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-------------|
| Command Modes | Boot loader |
|----------------------|-------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | The ARP table contains the IP-address-to-MAC-address mappings. |
|-------------------------|--|

| | |
|-----------------|--|
| Examples | This example shows how to display the ARP table: |
|-----------------|--|

```
Device: arp 172.20.136.8
arp'ing 172.20.136.8...
172.20.136.8 is at 00:1b:78:d1:25:ae, via port 0
```

boot

To load and boot an executable image and display the command-line interface (CLI), use the **boot** command in boot loader mode.

```
boot [-post | -n | -p | flag] filesystem:/file-url...
```

| Syntax Description | |
|--------------------|---|
| -post | (Optional) Run the loaded image with an extended or comprehensive power-on self-test (POST). Using this keyword causes POST to take longer to complete. |
| -n | (Optional) Pause for the Cisco IOS Debugger immediately after launching. |
| -p | (Optional) Pause for the JTAG Debugger right after loading the image. |
| <i>filesystem:</i> | Alias for a file system. Use flash: for the system board flash device; use usbflash0: for USB memory sticks. |
| <i>/file-url</i> | Path (directory) and name of a bootable image. Separate image names with a semicolon. |

Command Default No default behavior or values.

Command Modes Boot loader

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

When you enter the **boot** command without any arguments, the device attempts to automatically boot the system by using the information in the BOOT environment variable, if any.

If you supply an image name for the *file-url* variable, the **boot** command attempts to boot the specified image.

When you specify boot loader **boot** command options, they are executed immediately and apply only to the current boot loader session.

These settings are not saved for the next boot operation.

Filenames and directory names are case sensitive.

Example

This example shows how to boot the device using the *new-image.bin* image:

```
Device: set BOOT flash:/new-images/new-image.bin  
Device: boot
```

After entering this command, you are prompted to start the setup program.

cat

To display the contents of one or more files, use the **cat** command in boot loader mode.

cat *filesystem:/file-url...*

Syntax Description

filesystem: Specifies a file system.

/file-url Specifies the path (directory) and name of the files to display. Separate each filename with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Filenames and directory names are case sensitive.

If you specify a list of files, the contents of each file appears sequentially.

Examples

This example shows how to display the contents of an image file:

```
Device: cat flash:image_file_name
version_suffix: universal-122-xx.SEx
version_directory: image_file_name
image_system_type_id: 0x00000002
image_name: image_file_name.bin
ios_image_file_size: 8919552
total_image_file_size: 11592192
image_feature: IP|LAYER_3|PLUS|MIN_DRAM_MEG=128
image_family: family
stacking_number: 1.34
board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b
info_end:
```

copy

To copy a file from a source to a destination, use the **copy** command in boot loader mode.

```
copy filesystem:/source-file-url filesystem:/destination-file-url
```

Syntax Description

| | |
|------------------------------|---|
| <i>filesystem:</i> | Alias for a file system. Use usbflash0: for USB memory sticks. |
| <i>/source-file-url</i> | Path (directory) and filename (source) to be copied. |
| <i>/destination-file-url</i> | Path (directory) and filename of the destination. |

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Filenames and directory names are case sensitive.

Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Filenames are limited to 127 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

If you are copying a file to a new directory, the directory must already exist.

Examples

This example shows how to copy a file at the root:

```
Device: copy usbflash0:test1.text usbflash0:test4.text  
File "usbflash0:test1.text" successfully copied to "usbflash0:test4.text"
```

You can verify that the file was copied by entering the **dir filesystem:** boot loader command.

copy startup-config tftp:

To copy the configuration settings from a switch to a TFTP server, use the **copy startup-config tftp:** command in Privileged EXEC mode.

copy startup-config tftp: *remote host {ip-address}/{name}*

| | |
|---------------------------|--|
| Syntax Description | <i>remote host {ip-address}/{name}</i> Host name or IP-address of Remote host. |
|---------------------------|--|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-----------------|
| Command Modes | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release | Modification |
|------------------------|---------------------------|------------------------------|
| | Cisco IOS XE Release 16.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | To copy your current configurations from the switch, run the command copy startup-config tftp: and follow the instructions. The configurations are copied onto the TFTP server. |
|-------------------------|--|

Then, login to another switch and run the command **copy tftp: startup-config** and follow the instructions. The configurations are now copied onto the other switch.

| | |
|-----------------|---|
| Examples | This example shows how to copy the configuration settings onto a TFTP server: |
|-----------------|---|

```
Device: copy startup-config tftp:
Address or name of remote host []?
```

copy tftp: startup-config

To copy the configuration settings from a TFTP server onto a new switch, use the **copy tftp: startup-config** command in Privileged EXEC mode on the new switch.

```
copy tftp: startup-config remote host {ip-address}/{name}
```

| | |
|---------------------------|--|
| Syntax Description | <i>remote host {ip-address}/{name}</i> Host name or IP-address of Remote host. |
|---------------------------|--|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-----------------|
| Command Modes | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release | Modification |
|------------------------|---------------------------|------------------------------|
| | Cisco IOS XE Release 16.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | After the configurations are copied, to save your configurations, use write memory command and then either reload the switch or run the copy startup-config running-config command. |
|-------------------------|---|

| | |
|-----------------|---|
| Examples | This example shows how to copy the configuration settings from the TFTP server onto a switch: |
|-----------------|---|

```
Device: copy tftp: startup-config  
Address or name of remote host []?
```

debug voice diagnostics mac-address

To enable debugging of voice diagnostics for voice clients, use the **debug voice diagnostics mac-address** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug voice diagnostics mac-address *mac-address1* **verbose** **mac-address** *mac-address2* **verbose**
nodebug voice diagnostics mac-address *mac-address1* **verbose** **mac-address** *mac-address2* **verbose**

| Syntax Description | voice diagnostics | Configures voice debugging for voice clients. |
|--------------------|---|---|
| | mac-address <i>mac-address1</i> mac-address <i>mac-address2</i> | Specifies MAC addresses of the voice clients. |
| | verbose | Enables verbose mode for voice diagnostics. |

Command Default No default behavior or values.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

The following is sample output from the **debug voice diagnostics mac-address** command and shows how to enable debugging of voice diagnostics for voice client with MAC address of 00:1f:ca:cf:b6:60:

```
Device# debug voice diagnostics mac-address 00:1f:ca:cf:b6:60
```

debug platform condition feature multicast controlplane

To enable radioactive tracing for the Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) snooping features, use the **debug platform condition feature multicast controlplane** command in privileged EXEC mode. To disable radioactive tracing, use the **no** form of this command.

debug platform condition feature multicast controlplane **{igmp-debug | pim} group-ip** {*ipv4 address* / *ipv6 address*} | **{mld-snooping | igmp-snooping} mac** *mac-address* **ip** {*ipv4 address* / *ipv6 address*} **vlan** *vlan-id* } **level** {**debug** | **error** | **info** | **verbose** | **warning**}

no debug platform condition feature multicast controlplane **{igmp-debug | pim} group-ip** {*ipv4 address* / *ipv6 address*} | **{mld-snooping | igmp-snooping} mac** *mac-address* **ip** {*ipv4 address* / *ipv6 address*} **vlan** *vlan-id* } **level** {**debug** | **error** | **info** | **verbose** | **warning**}

| Syntax | Description |
|---|---|
| igmp-debug | Enables IGMP control radioactive tracing. |
| pim | Enables Protocol Independent Multicast (PIM) control radioactive tracing. |
| mld-snooping | Enables MLD snooping control radioactive tracing. |
| igmp-snooping | Enables IGMP snooping control radioactive tracing. |
| mac <i>mac-address</i> | MAC address of the receiver. |
| group-ip { <i>ipv4 address</i> / <i>ipv6 address</i> } | IPv4 or IPv6 address of the igmp-debug or pim group. |
| ip { <i>ipv4 address</i> / <i>ipv6 address</i> } | IPv4 or IPv6 address of the mld-snooping or igmp-snooping group. |
| vlan <i>vlan-id</i> | VLAN ID. The range is from 1 to 4094. |
| level | Enables debug severity levels. |
| debug | Enables debugging level. |
| error | Enables error debugging. |
| info | Enables information debugging. |
| verbose | Enables detailed debugging. |
| warning | Enables warning debugging. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

The following example shows how to enable radioactive tracing for IGMP snooping:

```
Device# debug platform condition feature multicast controlplane igmp-snooping mac
000a.f330.344a ip 10.1.1.10 vlan 550 level warning
```

| Related Commands | Command | Description |
|------------------|---|--|
| | clear debug platform condition all | Removes the debug conditions applied to a platform. |
| | debug platform condition | Filters debugging output for debug commands on the basis of specified conditions. |
| | debug platform condition start | Starts conditional debugging on a system. |
| | debug platform condition stop | Stops conditional debugging on a system. |
| | show platform condition | Displays the currently active debug configuration. |

debug platform condition mac

To enable radioactive tracing for MAC learning, use the **debug platform condition mac** command in privileged EXEC mode. To disable radioactive tracing for MAC learning, use the **no** form of this command.

debug platform condition mac {*mac-address* {**control-plane** | **egress** | **ingress**} | **access-list** *access-list name* {**egress** | **ingress**}}
no debug platform condition mac {*mac-address* {**control-plane** | **egress** | **ingress**} | **access-list** *access-list name* {**egress** | **ingress**}}

| Syntax Description | | |
|--|--|---|
| mac <i>mac-address</i> | | Filters output on the basis of the specified MAC address. |
| access-list <i>access-list name</i> | | Filters output on the basis of the specified access list. |
| control-plane | | Displays messages about the control plane routines. |
| egress | | Filters output on the basis of outgoing packets. |
| ingress | | Filters output on the basis of incoming packets. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

The following example shows how to filter debugging output on the basis of a MAC address:

```
Device# debug platform condition mac bc16.6509.3314 ingress
```

| Related Commands | Command | Description |
|------------------|---|--|
| | show platform condition | Displays the currently active debug configuration. |
| | debug platform condition | Filters debugging output for debug commands on the basis of specified conditions. |
| | debug platform condition start | Starts conditional debugging on a system. |
| | debug platform condition stop | Stops conditional debugging on a system. |
| | clear debug platform condition all | Removes the debug conditions applied to a platform. |

debug platform rep

To enable debugging of Resilient Ethernet Protocol (REP) functions, use the **debug platform rep** command in privileged EXEC mode. To remove the specified condition, use the **no** form of this command.

debug platform rep {all | error | event | packet | verbose}
no debug platform rep {all | error | event | packet | verbose}

| Syntax Description | | |
|--------------------|----------------|--------------------------------------|
| | all | Enables all REP debugging functions. |
| | error | Enables REP error debugging. |
| | event | Enables REP event debugging. |
| | packet | Enables REP packet debugging. |
| | verbose | Enables REP verbose debugging. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

The following example shows how to enable debugging for all functions:

```
Device# debug platform rep all

debug platform rep verbose debugging is on
debug platform rep control pkt handle debugging is on
debug platform rep error debugging is on
debug platform rep event debugging is on
```

| Related Commands | Command | Description |
|------------------|---|--|
| | show platform condition | Displays the currently active debug configuration. |
| | debug platform condition | Filters debugging output for debug commands on the basis of specified conditions. |
| | debug platform condition start | Starts conditional debugging on a system. |
| | debug platform condition stop | Stops conditional debugging on a system. |
| | clear debug platform condition all | Removes the debug conditions applied to a platform. |

debug ilpower powerman

To enable debugging of the power controller and Power over Ethernet (PoE) system, use the **debug ilpower powerman** command in privileged EXEC mode. Use the no form of this command to disable debugging.

Command Default This command has no arguments or keywords.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

This example shows the output for the **debug ilpower powerman** command for releases prior to Cisco IOS XE Gibraltar 16.10.1:

```
Device# debug ilpower powerman
1. %ILPOWER-3-CONTROLLER_PORT_ERR: Controller port error, Interface
Gix/y/z: Power Controller reports power Imax error detected
Mar 8 16:35:17.801: ilpower_power_assign_handle_event: event 0, pwrassign
is done by proto CDP
Port Gil/0/48: Selected Protocol CDP

```

delete

To delete one or more files from the specified file system, use the **delete** command in boot loader mode.

delete *filesystem:/file-url...*

Syntax Description

filesystem: Alias for a file system. Use **usbflash0:** for USB memory sticks.

/file-url... Path (directory) and filename to delete. Separate each filename with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Filenames and directory names are case sensitive.

The device prompts you for confirmation before deleting each file.

Examples

This example shows how to delete two files:

```
Device: delete usbflash0:test2.text usbflash0:test5.text
Are you sure you want to delete "usbflash0:test2.text" (y/n)?y
File "usbflash0:test2.text" deleted
Are you sure you want to delete "usbflash0:test5.text" (y/n)?y
File "usbflash0:test2.text" deleted
```

You can verify that the files were deleted by entering the **dir usbflash0:** boot loader command.

dir

To display the list of files and directories on the specified file system, use the **dir** command in boot loader mode.

dir *filesystem:/file-url*

| Syntax Description | <i>filesystem:</i> Alias for a file system. Use flash: for the system board flash device; use usbflash0: for USB memory sticks. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| | <i>/file-url</i> (Optional) Path (directory) and directory name that contain the contents you want to display. Separate each directory name with a space. | | | | |
| Command Default | No default behavior or values. | | | | |
| Command Modes | Boot Loader Privileged EXEC | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |
| Usage Guidelines | Directory names are case sensitive. | | | | |
| Examples | This example shows how to display the files in flash memory: | | | | |

```
Device: dir flash:
Directory of flash:/
  2  -rwx      561   Mar 01 2013 00:48:15  express_setup.debug
  3  -rwx    2160256  Mar 01 2013 04:18:48  c2960x-dmon-mz-150-2r.EX
  4  -rwx      1048   Mar 01 2013 00:01:39  multiple-fs
  6  drwx      512   Mar 01 2013 23:11:42  c2960x-universalk9-mz.150-2.EX

Table 204: dir Field Descriptions

| Field | Description |
|-------|--|
| 2 | Index number of the file. |
| -rwx | File permission, which can be any or all of the following: <ul style="list-style-type: none"> • d—directory • r—readable • w—writable • x—executable |

| Field | Description |
|----------|-------------------------|
| 1644045 | Size of the file. |
| <date> | Last modification date. |
| env_vars | Filename. |

exit

To return to the previous mode or exit from the CLI EXEC mode, use the **exit** command.

exit

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes Privileged EXEC
Global configuration

| Command History | Release | Modification |
|-----------------|--------------------------------|---------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

This example shows how to exit the configuration mode:

```
Device(config)# exit  
Device#
```

factory-reset

To erase all customer-specific data and restore a device to its factory configuration, use the **factory-reset** command in privileged EXEC mode.

Note The erasure is consistent with the clear method, as described in NIST SP 800-88 Rev. 1.

Standalone Device

```
factory-reset { all [ secure ] [3-pass] | boot-vars | config }
```

Stacked Device

```
factory-reset { all [secure 3-pass] | boot-vars | config | switch switch_number | all { all [secure 3-pass] | boot-vars | config } }
```

Syntax Description

| | |
|---|---|
| all | Erases all the content from the NVRAM, all Cisco IOS images, including the current boot image, boot variables, startup and running configuration data, and user data. |
| all secure | Performs data sanitization and securely resets the device. Note This option implements guidelines for media sanitization as described in NIST SP 800-88 Rev. 1. |
| secure 3-pass | Erases all the content from the device with 3-pass overwrite. <ul style="list-style-type: none"> • Pass 1: Overwrites all addressable locations with binary zeroes. • Pass 2: Overwrites all addressable locations with binary ones. • Pass 3: Overwrites all addressable locations with a random bit pattern. |
| boot-vars | Erases only the user-added boot variables. |
| config | Erases only the startup configurations. |
| switch { <i>switch_number</i> all } | Erases content on the selected switch: <ul style="list-style-type: none"> • <i>switch-number</i>: Specifies the switch number. The range is from 1 to 16. • all: Selects all the switches in the stack. |

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|---------------------------|------------------------------|
| Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

| Release | Modification |
|-------------------------------|--|
| Cisco IOS XE Amsterdam 17.2.1 | The secure 3-pass and switch keyword was introduced. |
| Cisco IOS XE Dublin 17.10.1 | The all secure option was introduced. |

Usage Guidelines

The **factory-reset** command is used in the following scenarios:

- To return a device to Cisco for Return Material Authorization (RMA), use this command to remove all the customer-specific data before obtaining an RMA certificate for the device.
- If the key information or credentials that are stored on a device is compromised, use this command to reset the device to factory configuration, and then reconfigure the device.

After the factory reset process is successfully completed, the device reboots and enters ROMMON mode.

Examples

The following example shows how to erase all the content from a device using the **factory-reset all** command:

```
Device> enable
Device# factory-reset all

The factory reset operation is irreversible for all operations. Are you sure? [confirm]
The following will be deleted as a part of factory reset:
1: Crash info and logs
2: User data, startup and running configuration
3: All IOS images, including the current boot image
4: OBFL logs
5: User added rommon variables
6: Data on Field Replaceable Units(USB/SSD/SATA)
The system will reload to perform factory reset.
It will take some time to complete and bring it to rommon.
You will need to load IOS image using USB/TFTP from rommon after
this operation is completed.
DO NOT UNPLUG THE POWER OR INTERRUPT THE OPERATION
Are you sure you want to continue? [confirm]
```

The following examples show how to perform a factory reset on stacked devices:

```
Device> enable
Device# factory-reset switch all all

The factory reset operation is irreversible for all operations. Are you sure? [confirm]
The following will be deleted as a part of factory reset:
1: Crash info and logs
2: User data, startup and running configuration
3: All IOS images, including the current boot image
4: OBFL logs
5: User added rommon variables
6: Data on Field Replaceable Units(USB/SSD/SATA)
The system will reload to perform factory reset.
It will take some time to complete and bring it to rommon.
You will need to load IOS image using USB/TFTP from rommon after
this operation is completed.
DO NOT UNPLUG THE POWER OR INTERRUPT THE OPERATION
Are you sure you want to continue? [confirm]

flash_init

To initialize the flash: file system, use the **flash_init** command in boot loader mode.

flash_init

Syntax Description

This command has no arguments or keywords.

Command Default

The flash: file system is automatically initialized during normal system operation.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

During the normal boot process, the flash: file system is automatically initialized.

Use this command to manually initialize the flash: file system. For example, you use this command during the recovery procedure for a lost or forgotten password.

help

To display the available commands, use the **help** command in boot loader mode.

help

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes Boot loader

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Example

This example shows how to display a list of available boot loader commands:

```
Device:help
? -- Present list of available commands
arp -- Show arp table or arp-resolve an address
boot -- Load and boot an executable image
cat -- Concatenate (type) file(s)
copy -- Copy a file
delete -- Delete file(s)
dir -- List files in directories
emergency-install -- Initiate Disaster Recovery
...
...
...
unset -- Unset one or more environment variables
version -- Display boot loader version
```

hostname

To specify or modify the hostname for the network server, use the **hostname** command in global configuration mode.

hostname *name*

| | | |
|---------------------------|-------------|--------------------------------------|
| Syntax Description | <i>name</i> | New hostname for the network server. |
|---------------------------|-------------|--------------------------------------|

Command Default The default hostname is switch.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The hostname is used in prompts and default configuration filenames.

Do not expect case to be preserved. Uppercase and lowercase characters look the same to many internet software applications. It may seem appropriate to capitalize a name the same way you might do in English, but conventions dictate that computer names appear all lowercase. For more information, refer to RFC 1178, *Choosing a Name for Your Computer*.

The name must also follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names must be 63 characters or fewer. Creating an all numeric hostname is not recommended but the name will be accepted after an error is returned.

```
Device(config)#hostname 123
% Hostname contains one or more illegal characters.
123(config)#
```

A hostname of less than 10 characters is recommended. For more information, refer to RFC 1035, *Domain Names--Implementation and Specification*.

On most systems, a field of 30 characters is used for the hostname and the prompt in the CLI. Note that the length of your hostname may cause longer configuration mode prompts to be truncated. For example, the full prompt for service profile configuration mode is:

```
(config-service-profile)#
```

However, if you are using the hostname of “Switch,” you will only see the following prompt (on most systems):

```
Switch(config-service-profil)#
```

If the hostname is longer, you will see even less of the prompt:

```
Basement-rtr2(config-service)#
```

Keep this behavior in mind when assigning a name to your system (using the **hostname** global configuration command). If you expect that users will be relying on mode prompts as a CLI navigation aid, you should assign hostnames of no more than nine characters.

The use of a special character such as \" (backslash) and a three or more digit number for the character setting like **hostname**, results in incorrect translation:

```
Device(config)#
Device(config)#hostname \\99
% Hostname contains one or more illegal characters.
```

Examples

The following example changes the hostname to “host1”:

```
Device(config)# hostname host1
host1(config)#
```

hw-module subslot oir power-cycle

To reset or power-cycle a module from the CLI, use the **hw-module subslot oir power-cycle** command in privileged EXEC mode.

```
hw-module switch switch-no subslot slot / subslot oir power-cycle [ force ]
```

| Syntax Description | | |
|--------------------|--|--|
| <i>switch-no</i> | | The switch to access. Valid values are 1 and 2. |
| <i>slot</i> | | Specifies the Physical slot number on the chassis. |
| <i>subslot</i> | | Subslot is always 0. |
| force | | Performs the power cycle without prompting for confirmation. |

Command Default No default behavior or values.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.2 | This command was introduced. |

Usage Guidelines The **hw-module subslot oir power-cycle** command resets the specified module. This command is not supported on the supervisor slots. Do not use the command when the line cards are booting up.

Example

The following example shows how to power-cycle the module in slot 1 of the chassis:

```
Device# hw-module switch 1 subslot 1/0 oir power-cycle force
```

```
*Sep  3 20:11:05.219 UTC: %IOSXE_OIR-6-REMSPA: SPA removed from chassis 1 subslot 1/0,
interfaces disabled
*Sep  3 20:11:05.295 UTC: %SPA_OIR-6-OFFLINECARD: SPA (C9400-LC-24XS) offline in chassis 1
subslot 1/0
*Sep  3 20:11:36.812 UTC: %IOSXE_OIR-6-INSSPA: SPA inserted in chassis 1 subslot 1/0
*Sep  3 20:13:41.316 UTC: %SPA_OIR-6-ONLINECARD: SPA (C9400-LC-24XS) online in chassis 1
subslot 1/0
```

install

To install Software Maintenance Upgrade (SMU) packages, use the **install** command in privileged EXEC mode.

```
install {abort | activate | file {bootflash: | flash: | harddisk: | webui:} [{auto-abort-timer timer timer
prompt-level {all | none}}]} | add file {bootflash: | flash: | ftp: | harddisk: | http: | https: | rcp: | scp:
| tftp: | webui:} [{activate [{auto-abort-timer timer prompt-level {all | none}commit}}]}] | commit |
auto-abort-timer stop | deactivate file {bootflash: | flash: | harddisk: | webui:} | label id{description
description | label-name name} | remove {file {bootflash: | flash: | harddisk: | webui:} | inactive } |
rollback to {base | committed | id {install-ID} | label {label-name}}
```

| Syntax Description | | |
|--|--|---|
| abort | | Terminates the current install operation. |
| activate | | Validates whether the SMU is added through the install add command. This keyword runs a compatibility check, updates package status, and if the package can be restarted, triggers post-install scripts to restart the necessary processes, or triggers a reload for nonrestartable packages. |
| file | | Specifies the package to be activated. |
| { bootflash: flash: harddisk: webui: } | | Specifies the location of the installed package. |
| auto-abort-timer <i>timer</i> | | (Optional) Installs an auto-abort timer. |
| prompt-level { all none } | | (Optional) Prompts a user about installation activities. For example, the activate keyword automatically triggers a reload for packages that require a reload. Before activating the package, a message prompts users about wanting to continue or not. The all keyword allows you to enable prompts. The none keyword disables prompts. |
| add | | Copies files from a remote location (through FTP or TFTP) to a device and performs SMU compatibility check for the platform and image versions. This keyword runs base compatibility checks to ensure that a specified package is supported on a platform. |
| { bootflash: flash: ftp: harddisk: http: https: rcp: scp: tftp: webui: } | | Specifies the package to be added. |

| | |
|------------------------------|---|
| commit | Makes SMU changes persistent over reloads. You can perform a commit after activating a package while the system is up, or after the first reload. If a package is activated, but not committed, it remains active after the first reload, but not after the second reload. |
| auto-abort-timer stop | Stops the auto-abort timer. |
| deactivate | Deactivates an installed package. Note Deactivating a package also updates the package status and might trigger a process restart or reload. |
| label id | Specifies the ID of the install point to label. |
| description | Adds a description to the specified install point. |
| label-name name | Adds a label name to the specified install point. |
| remove | Removes the installed packages. The remove keyword can only be used on packages that are currently inactive. |
| inactive | Removes all the inactive packages from the device. |
| rollback | Rolls back the data model interface (DMI) package SMU to the base version, the last committed version, or a known commit ID. |
| to base | Returns to the base image. |
| committed | Returns to the installation state when the last commit operation was performed. |
| id install-ID | Returns to the specific install point ID. Valid values are from 1 to 4294967295. |

Command Default Packages are not installed.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|------------------------|-----------------------------|---|
| | Cisco IOS XE Everest 16.6.3 | This command was introduced. |
| | Cisco IOS XE Fuji 16.9.1 | Hot-patching support is introduced. Sample output updated with hot SMU outputs. |

Usage Guidelines

An SMU is a package that can be installed on a system to provide a patch fix or security resolution to a released image. This package contains a minimal set of files for patching the release along with metadata that describes the contents of the package.

Packages must be added before the SMU is activated.

A package must be deactivated before it is removed from Flash. A removed packaged must be added again.

The following example shows how to add an install package to a device:

```
Device# install add file
flash:cat9k_iosxe.BLD_SMU_20180302_085005_TWIG_LATEST_20180306_013805.3.SSA.smu.bin

Related Commands

| Command | Description |
|---------------------|--|
| show install | Displays information about the install packages. |

ip http banner

Note The **ip http banner** command is not available in Cisco IOS XE Cupertino 17.9.6 release and later Cisco IOS XE Cupertino 17.9.x releases.

To enable the HTTP or HTTP Secure (HTTPS) server banner, use the **ip http banner** command in global configuration mode. To disable the HTTP or HTTPS server banner, use the **no** form of this command.

ip http banner
no ip http banner

Syntax Description This command has no arguments or keywords.

Command Default The HTTP or HTTPS server banner is not enabled.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|-------------------------------|--|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Cupertino 17.9.6 | This command was removed. It is not available in Cisco IOS XE Cupertino 17.9.6 release and later Cisco IOS XE Cupertino 17.9.x releases. |

Usage Guidelines While the HTTP server processes a request, if the session ID is invalid or expired, the server redirects the user to a banner page. The banner page allows the user to log in with credentials. The server validates the credentials and processes the request.

Examples The following example shows how to enable the HTTP or HTTPS server banner:

```
Device> enable
Device# configure terminal
Device(config)# ip http banner
Device(config)# end
```

| Related Commands | Command | Description |
|------------------|----------------------------|---|
| | ip http banner-path | Sets a custom path for the HTTP or HTTPS banner page. |

ip http banner-path

Note The **ip http banner-path** command is not available in Cisco IOS XE Cupertino 17.9.6 release and later Cisco IOS XE Cupertino 17.9.x releases.

To set a custom path for the HTTP or HTTP Secure (HTTPS) banner page, use the **ip http banner-path** command in global configuration mode. To disable the custom path for the HTTP or HTTPS banner page, use the **no** form of this command.

ip http banner-path *path-name*
no ip http banner-path *path-name*

Syntax Description

| | |
|------------------|---|
| <i>path-name</i> | Custom path for the HTTP or HTTPS banner. |
|------------------|---|

Command Default

The custom path for the HTTP or HTTPS banner is not set.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-------------------------------|--|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Cupertino 17.9.6 | This command was removed. It is not available in Cisco IOS XE Cupertino 17.9.6 release and later Cisco IOS XE Cupertino 17.9.x releases. |

Usage Guidelines

Use the **ip http banner-path** command to direct the user to the banner path.

If the command is not configured or if the custom banner path does not exist, the server directs the user to the default banner page.

Examples

The following example shows how to set the path to the HTTP or HTTPS banner page:

```
Device> enable
Device# configure terminal
Device(config)# ip http banner-path welcome
Device(config)# end
```

Related Commands

| Command | Description |
|-----------------------|--|
| ip http banner | Enables the HTTP or HTTPS server banner. |

ip ssh bulk-mode

To enable the Secure Shell (SSH) bulk data transfer mode, use the **ip ssh bulk-mode** command in global configuration mode. To disable this mode, use the **no** form of this command.

```
ip ssh bulk-mode [ window-size ]
no ip ssh bulk-mode [ window-size ]
```

Syntax Description

window-size (Optional) The SSH window size. The range is from 131072 to 1073741824. The default is 131072.

Command Default

SSH bulk mode is enabled.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|-------------------------------|---|
| Cisco IOS XE Amsterdam 17.2.1 | This command was introduced. |
| Cisco IOS XE Bengaluru 17.6.1 | This command was modified. The <i>window-size</i> variable option was introduced. |
| Cisco IOS XE Dublin 17.10.1 | SSH bulk mode is enabled by default. |

Usage Guidelines

SSH bulk mode enables optimizing the throughput performance of procedures that involve the transfer of large amounts of data. The Secure Copy feature has been enhanced to leverage bulk mode optimizations.

Beginning from Cisco IOS XE Dublin 17.10.1, SSH bulk mode is enabled by default with the default window size of 128KB.

Note

- Bulk data transfer mode does not support the time or volume-based SSH rekey functionality.
- Bulk data transfer mode is not supported with SSH Version 1.

Examples

The following example shows how to enable bulk data transfer mode on an SSH server:

```
Device> enable
Device# configure terminal
Device(config)# ip ssh bulk-mode
Device(config)# exit
```

l2 traceroute

To enable the Layer 2 traceroute server, use the **l2 traceroute** command in global configuration mode. Use the **no** form of this command to disable the Layer 2 traceroute server.

l2 traceroute
no l2 traceroute

Syntax Description This command has no arguments or keywords.

Command Modes Global configuration (config#)

| Command History | Release | Modification |
|------------------------|-----------------------------|-----------------------------|
| | Cisco IOS XE Everest 16.6.1 | The command was introduced. |

Usage Guidelines Layer 2 traceroute is enabled by default and opens a listening socket on User Datagram Protocol (UDP) port 2228. To close the UDP port 2228 and disable Layer 2 traceroute, use the **no l2 traceroute** command in global configuration mode.

The following example shows how to configure Layer 2 traceroute using the **l2 traceroute** command.

```
Device# configure terminal  
Device(config)# l2 traceroute
```

license air level

To configure AIR licenses on a wireless controller that is connected to Cisco Catalyst Access, Core, and Aggregation Switches, enter the **license air level** command in global configuration mode. To revert to the default setting, use the **no** form of this command.

```
license air level { air-network-advantage [ addon air-dna-advantage ] | air-network-essentials [ addon air-dna-essentials ] }
```

no license air level

Syntax Description

| | |
|---------------------------------|--|
| air-network-advantage | Configures the AIR network advantage license level. |
| addon air-dna-advantage | (Optional) Configures the add-on AIR DNA advantage license level. This add-on option is available with the AIR network advantage license, and is the default license. |
| air-network-essentials | Configures the AIR network essential license level. |
| addon air-dna-essentials | (Optional) Configures the add-on AIR DNA essentials license level. This add-on option is available with the AIR network essential license. |

Command Default

AIR DNA Advantage is the default license

Command Modes

Global configuration (Device(config)#)

Command History

| Release | Modification |
|--------------------------------|---|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| Cisco IOS XE Amsterdam 17.3.2a | This command continues to be available and applicable with the introduction of Smart Licensing Using Policy in this release. See the <i>Usage Guidelines</i> section below for details. |

Usage Guidelines

In the Smart Licensing Using Policy environment, you can use the **license air level** command to change the license level being used on the product instance, or to additionally configure an add-on license on the product instance. The change is effective after a reload.

The licenses that can be configured are:

- AIR Network Essential
- AIR Network Advantage
- AIR DNA Essential
- AIR DNA Advantage

You can configure AIR DNA Essential or AIR DNA Advantage license level, and on term expiry, you can move to the Network Advantage or Network Essentials license level, if you do not want to renew the DNA license.

Every connecting Access Point requires a Cisco DNA Center License to leverage the unique value properties of the controller.

For more information, see the [Cisco Catalyst 9800 Series Wireless Controller Software Configuration Guide](#) for the required release.

Examples

The following example shows how to configure the AIR DNA Essential license level:

```
Device# configure terminal
Device(config)# license air level network-essentials addon air-dna-essentials
```

The following example shows how to configure the AIR DNA Advantage license level:

```
Device# configure terminal
Device(config)# license air level air-network-advantage addon air-dna-advantage
```

license boot level

To boot a new software license on the device, use the **license boot level** command in global configuration mode. Use the **no** form of this command to remove all software licenses from the device.

```
license boot level { network-advantage [ addon dna-advantage ] | network-essentials [ addon dna-essentials ] }
```

```
no license boot level
```

Syntax Description

| | |
|---|--|
| network-advantage [addon dna-advantage] | Configures the Network Advantage license. Optionally, you can also configure the Digital Networking Architecture (DNA) Advantage license. |
| network-essentials [addon dna-essentials] | Configures the Network Essentials license. Optionally, you can also configure the Digital Networking Architecture (DNA) Essentials license. |

Command Default

Network Essentials

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|--------------------------------|---|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| Cisco IOS XE Amsterdam 17.3.2a | This command continues to be available and applicable with the introduction of Smart Licensing Using Policy in this release. See the <i>Usage Guidelines</i> section below for details. |

Usage Guidelines

The software features available on Cisco Catalyst 9000 Series Switches fall under these base or add-on license levels:

Base Licenses:

- Network Essentials
- Network Advantage—Includes features available with the Network Essentials license and more.

Add-on Licenses:

- DNA Essentials
- DNA Advantage—Includes features available with the Network Essentials license and more.

Base licenses are permanent or perpetual licenses.

Add-on licenses are subscription or term licenses and can be purchased for a three, five, or seven year period. Base licenses are a prerequisite for add-on licenses. See the release notes for more information about this.

The sections below provide information about using the **license boot level** command in the earlier Smart Licensing environment, and in the Smart Licensing Using Policy environment.

Smart Licensing: If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, Smart Licensing is enabled by default and you can use the **license boot level** command for these purposes:

- Downgrade or upgrade licenses
- Enable or disable an evaluation or extension license
- Clear an upgrade license

This command forces the licensing infrastructure to boot the configured license level instead of the license hierarchy maintained by the licensing infrastructure for a given module:

- When the switch reloads, the licensing infrastructure checks the configuration in the startup configuration for licenses, if any. If there is a license in the configuration, the switch boots with that license. If there is no license, the licensing infrastructure follows the image hierarchy to check for licenses.
- If the forced boot evaluation license expires, the licensing infrastructure follows the regular hierarchy to check for licenses.
- If the configured boot license has already expired, the licensing infrastructure follows the hierarchy to check for licenses.

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, Smart Licensing Using Policy is enabled by default and you can use the **license boot level** command for these purposes:

- To change the base or add-on license levels being used on the product instance.

For example, if you are using Network Essentials and you want to use Network Advantage with the next reload, or if you are using DNA Advantage and you want to use DNA Essentials with the next reload.

- To add or remove add-on license levels being used on the product instance.

For example, if you are using only Network Essentials and you want to use DNA Essentials with the next reload, or if you are using DNA Advantage and you do not want to use the add-on after the next reload.

The notion of evaluation or expired licenses does not exist in Smart Licensing Using Policy.

After the command is configured, the configured license is effective after the next reload. License usage continues to be recorded on device and this changed licensing consumption information may have to be sent via the next Resource Utilization Measurement Report (RUM report), to CSSM. The reporting requirements and frequency are determined by the policy that is applied. See the *Usage Reporting*: section of the **show license status** command output. For more information about Smart Licensing Using Policy, in the software configuration guide of the required release, see *System Management > Smart Licensing Using Policy*.

Examples

The following example shows how to configure the Network Essentials license at the next reload:

```
Device# configure terminal
Device(config)# license boot level network-essentials
Device(config)# exit
Device# copy running-config startup-config
Device# reload
```

The following example shows how to activate the DNA Essentials license at the next reload:

```
Device# configure terminal  
Device(config)# license boot level network-essentials add-on dna-essentials  
Device(config)# exit  
Device# copy running-config startup-config  
Device# reload
```

license smart (global config)

To configure licensing-related settings such as the mode of transport and the URL that the product instance uses to communicate with Cisco Smart Software Manager (CSSM), or Cisco Smart Licensing Utility (CSLU), or Smart Software Manager On-Prem (SSM On-Prem), to configure the usage reporting interval, to configure the information that must be excluded or included in a license usage report (RUM report), enter the **license smart** command in global configuration mode. Use the **no** form of the command to revert to default values.

```
license smart { custom_id ID | enable | privacy { all | hostname | version } | proxy { address
address_hostname | port port } | reservation | server-identity-check | transport { automatic | callhome
| cslu | off | smart } | url { url | cslu cslu_or_on-prem_url | default | smart smart_url | utility secondary_url
} | usage { customer-tags { tag1 | tag2 | tag3 | tag4 } tag_value | interval interval_in_days } | utility [
customer_info { city city | country country | postalcode postalcode | state state | street street } ] }
```

```
no license smart { custom_id | enable | privacy { all | hostname | version } | proxy { address
address_hostname | port port } | reservation | server-identity-check | transport | url { url | cslu
cslu_or_on-prem_url | default | smart smart_url | utility secondary_url } | usage { customer-tags { tag1
| tag2 | tag3 | tag4 } tag_value | interval interval_in_days } | utility [ customer_info { city city | country
country | postalcode postalcode | state state | street street } ] }
```

| Syntax Description | | |
|----------------------------|--|---|
| custom_id <i>ID</i> | | Although available on the CLI, this option is not supported. |
| enable | | Although visible on the CLI, configuring this keyword has no effect. Smart licensing is always enabled. |

privacy { all | hostname | version }

Sets a privacy flag to prevent the sending of the specified data privacy related information.

When the flag is disabled, the corresponding information is sent in a message or offline file created by the product instance.

Depending on the topology this is sent to one or more components, including CSSM, CSLU, and SSM On-Prem.

All data privacy settings are disabled by default. You must configure the option you want to exclude from all communication:

- **all**: All data privacy related information is excluded from any communication.

The **no** form of the command causes all data privacy related information to be sent in a message or offline file.

Note The Product ID (PID) and serial number are *included in the RUM report* regardless of whether data privacy is enabled or not.

- **hostname**: Excludes hostname information from any communication. When hostname privacy is enabled, the *UDI* of the product instance is displayed on the applicable user interfaces (CSSM, CSLU, and SSM On-Prem).

The **no** form of the command causes hostname information to be sent in a message or offline file. The hostname is displayed on the applicable user interfaces (CSSM, CSLU, and SSM On-Prem).

- **version**: Excludes the Cisco IOS-XE software version running on the product instance and the Smart Agent version from any communication.

The **no** form of the command causes version information to be sent in a message or offline file.

proxy { **address** *address_hostname* | **port** *port* } Configures a proxy for license usage synchronization with CSLU or CSSM. This means that you can use this option to configure a proxy only if the transport mode is **license smart transport smart** (CSSM), or **license smart transport cslu** (CSLU).

However, you cannot configure a proxy for license usage synchronization in an SSM On-Prem deployment, which also uses **license smart transport cslu** as the transport mode.

Configure the following options:

- **address** *address_hostname*: Configures the proxy address.

For *address_hostname*, enter the IP address or hostname of the proxy.

- **port***port*: Configures the proxy port.

For *port*, enter the proxy port number.

reservation Enables or disables a license reservation feature.

Note Although available on the CLI, this option is not applicable because license *reservation* is not applicable in the Smart Licensing Using Policy environment.

server-identity-check Enables or disables the HTTP secure server identity check.

transport { **automatic** | **callhome** | **cslu** | **off** | **smart** } Configures the mode of transport the product instance uses to communicate with CSSM. Choose from the following options:

- **automatic**: Sets the transport mode **cslu**.
- **callhome**: Enables Call Home as the transport mode.
- **cslu**: Enables CSLU as the transport mode. This is the default transport mode.

The same keyword applies to both CSLU *and* SSM On-Prem, but the URLs are different. See **cslu***cslu_or_on-prem_url* in the following row.

- **off**: Disables all communication from the product instance.
 - **smart**: Enables Smart transport.
-

```
url { url | cslu cslu_url | default | smart  
smart_url | utility secondary_url }
```

Sets a URL for the configured transport mode. Choose from the following options:

- **url**: If you have configured the transport mode as **callhome**, configure this option. Enter the CSSM URL exactly as follows:

```
https://tools.cisco.com/its/service/odbae/services/DCEService
```

The **no license smart url url** command reverts to the default URL.

- **cslu cslu_or_on-prem_url**: If you have configured the transport mode as **cslu**, configure this option, with the URL for CSLU or SSM On-Prem, as applicable:

- If you are using CSLU, enter the URL as follows:

```
http://<cslu_ip_or_host>:8182/cslu/v1/pi
```

For <cslu_ip_or_host>, enter the hostname or the IP address of the windows host where you have installed CSLU. 8182 is the port number and it is the only port number that CSLU uses.

The **no license smart url cslu cslu_or_on-prem_url** command reverts to

```
http://cslu-local:8182/cslu/v1/pi
```

- If you are using SSM On-Prem, enter the URL as follows:

```
http://<ip>/cslu/v1/pi/<tenant ID>
```

For <ip>, enter the hostname or the IP address of the server where you have installed SSM On-Prem. The <tenantID> must be the default local virtual account ID.

Tip You can retrieve the entire URL from SSM On-Prem. In the software configuration guide of the required release (17.3.x onwards), see *System Management > Smart Licensing Using Policy > Task Library for Smart Licensing Using Policy > Retrieving the Transport URL (SSM On-Prem UI)*.

The **no license smart url cslu cslu_or_on-prem_url** command reverts to

```
http://cslu-local:8182/cslu/v1/pi
```

- **default**: Depends on the configured transport mode. Only the **smart** and **cslu** transport modes are supported with this option.

If the transport mode is set to **cslu**, and you configure

license smart url default, the CSLU URL is configured automatically

(<https://cslu-local:8182/cslu/v1/pi>).

If the transport mode is set to **smart**, and you configure **license smart url default**, the Smart URL is configured automatically

(<https://smartreceiver.cisco.com/licservice/license>).

- **smart** *smart_url*: If you have configured the transport type as **smart**, configure this option. Enter the URL exactly as follows:

<https://smartreceiver.cisco.com/licservice/license>

When you configure this option, the system automatically creates a duplicate of the URL in **license smart url url**. You can ignore the duplicate entry, no further action is required.

The **no license smart url smartsmart_url** command reverts to the default URL.

- **utility** *smart_url*: Although available on the CLI, this option is not supported.
-

usage { **customer-tags** { **tag1** | **tag2** | **tag3** | **tag4** } *tag_value* | **interval** *interval_in_days* } Configures usage reporting settings. You can set the following options:

- **customer-tags** { **tag1** | **tag2** | **tag3** | **tag4** } *tag_value*: Defines strings for inclusion in data models, for telemetry. Up to 4 strings (or tags) may be defined.
For *tag_value*, enter the string value for each tag that you define.
- **interval** *interval_in_days*: Sets the reporting interval in days. By default the RUM report is sent every 30 days. The valid value range is 1 to 3650.

If you set the value to zero, RUM reports are not sent, regardless of what the applied policy specifies - this applies to topologies where CSLU or CSSM may be on the receiving end.

If you set a value that is greater than zero and the transport type is set to **off**, then, between the *interval_in_days* and the policy value for `Ongoing reporting frequency(days) :`, the lower of the two values is applied. For example, if *interval_in_days* is set to 100, and the value in the in the policy says `Ongoing reporting frequency (days):90`, RUM reports are sent every 90 days.

If you do not set an interval, and the default is effective, the reporting interval is determined entirely by the policy value. For example, if the default value is effective and only unenforced licenses are in use, if the policy states that reporting is not required, then RUM reports are not sent.

utility [**customer_info** { **city** *city* | **country** *country* | **postalcode** *postalcode* | **state** *state* | **street** *street* }] Although visible on the CLI, this option is not supported on any of the Cisco Catalyst Access, Core, and Aggregation Switches.

Command Default

Cisco IOS XE Amsterdam 17.3.1 or earlier: Smart Licensing is enabled by default

Cisco IOS XE Amsterdam 17.3.2a and later: Smart Licensing Using Policy is enabled by default.

Command Modes

Global config (Device(config)#)

Command History

| Release | Modification |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

| Release | Modification |
|-----------------------------------|--|
| Cisco IOS XE Amsterdam 17.3.2a | <p>The following keywords and variables were introduced with Smart Licensing Using Policy:</p> <ul style="list-style-type: none"> Under the url keyword, these options were introduced: <pre>{ cslu <i>cslu_url</i> smart <i>smart_url</i> }</pre> Under the transport keyword, these options were introduced: <pre>{ cslu off }</pre> <p>Further, the default transport type was changed from callhome, to cslu.</p> usage { customer-tags { tag1 tag2 tag3 tag4 } <i>tag_value</i> interval <i>interval_in_days</i> } <p>The following keywords and variables under the license smart global command are deprecated and no longer available on the CLI: enable and conversion automatic.</p> |
| Cisco IOS XE Amsterdam 17.3.3 | <p>SSM On-Prem support was introduced. For product instance-initiated communication in an SSM On-Prem deployment, the existing [no] license smart url cslu <i>cslu_or_on-prem_url</i> command supports the configuration of a URL for SSM On-Prem as well. But the required URL format for SSM On-Prem is: <pre>http://<ip>/cslu/v1/pi/<tenant ID>.</pre> </p> <p>The corresponding transport mode that must be configured is also an existing command (license smart transport cslu).</p> |
| Cisco IOS XE Cupertino 17.7.1 | <p>If version privacy is disabled (no license smart privacy version global configuration command), the Cisco IOS-XE software version running on the product instance and the Smart Agent version is <i>included</i> in the RUM report.</p> <p>To exclude version information from the RUM report, version privacy must be enabled (license smart privacy version).</p> |
| Cisco IOS XE Cupertino 17.9.1 | <ul style="list-style-type: none"> Support for sending hostname information was introduced. <p>If the privacy setting for the hostname is disabled (no license smart privacy hostname global configuration command), hostname information is sent from the product instance, in a separate sync message, or offline file. Depending on the topology you have implemented, the hostname information is received by CSSM, CSLU, or SSM On-Prem. It is also displayed on the corresponding user interface.</p> <ul style="list-style-type: none"> A new mechanism to send all data privacy related information was introduced. This information is no longer included in a RUM report. <p>If data privacy is disabled (no license smart privacy {all hostname version} global configuration command), data privacy related information is sent in a separate sync message or offline file.</p> |

When you disable a privacy setting, the topology you have implemented determines the recipient and how the information reaches its destination:

- The recipient of the information may be one or more of the following: CSSM, CSLU, and SSM On-Prem. The privacy setting has no effect on a controller (Cisco DNA Center).

In case of the **hostname** keyword, after the hostname information is received by CSSM, CSLU, or SSM On-Prem, it is also displayed on the corresponding UIs – as applicable. If you then *enable* privacy the corresponding UIs revert to displaying the UDI of the product instance.

- How the information is sent.
 - In case of a topology where the product instance initiates communication, the product instance initiates the sending of this information in a message, to CSSM, or CSLU, or SSM On-Prem.

The product instance sends the hostname sent every time one of the following events occur: the product instance boots up, the hostname changes, there is a switchover in a High Availability set-up.
 - In case of a topology where CSLU or SSM On-Prem initiate communication, the corresponding component initiates the retrieval of privacy information from the product instance.

The hostname is retrieved at the frequency you configure in CSLU or SSM On-Prem, to retrieve information.
 - In case of a topology where the product instance is in an air-gapped network, privacy information is included in the offline file that is generated when you enter the **license smart save usage** privileged EXEC command.

Note For all topologies, data privacy related information is *not* included in the RUM report.

Data privacy related information it is not stored by the product instance *prior* to sending or saving. This ensures that if and when information is sent, it is consistent with the data privacy setting at the time of sending or saving.

Communication failure and reporting

The reporting interval that you configure (**license smart usage interval** *interval_in_days* command), determines the date and time at which the product instance sends out the RUM report. If the scheduled interval coincides with a communication failure, the product instance attempts to send out the RUM report for up to four hours after the scheduled time has expired. If it is still unable to send out the report (because the communication failure persists), the system resets the interval to 15 minutes. Once the communication failure is resolved, the system reverts the reporting interval to the value that you last configured.

The system message you may see in case of a communication failure is %SMART_LIC-3-COMM_FAILED. For information about resolving this error and restoring the reporting interval value, in the software configuration guide of the required release (17.3.x onwards), see *System Management > Smart Licensing Using Policy > Troubleshooting Smart Licensing Using Policy*.

Proxy server acceptance

When configuring the **license smart proxy** {**address** *address_hostname* | **port***port*} command, note the change in the criteria for the acceptance of proxy servers, starting with Cisco IOS XE Bengaluru 17.6.1: only the status code of the proxy server response is verified by the system and not the reason phrase. The RFC

format is `status-line = HTTP-version SP status-code SP reason-phrase CRLF`, where the status code is a three-digit numeric code. For more information about the status line, see [section 3.1.2 of RFC 7230](#).

- [Examples for Data Privacy, on page 2054](#)
- [Examples for Transport Type and URL, on page 2055](#)
- [Examples for Usage Reporting Options, on page 2055](#)

Examples for Data Privacy

The following examples show how to configure data privacy related information using **license smart privacy** command in global configuration mode. The accompanying **show license status** output displays configured information.

Note The output of the **show** command only tells you if a particular option is enabled or disabled.

Here, no data privacy related information is sent:

```
Device# configure terminal
Device(config)# license smart privacy all
Device(config)# exit
Device# show license status
<output truncated>
Data Privacy:
  Sending Hostname: no
  Callhome hostname privacy: ENABLED
  Smart Licensing hostname privacy: ENABLED
  Version privacy: ENABLED

Transport:
  Type: Callhome
<output truncated>
```

Here, hostname is included and version information is excluded in the message initiated from the product instance. The product instance is directly connected to CSSM (transport type is **smart**, with the corresponding URL).

```
Device# configure terminal
Device(config)# license smart privacy version
Device(config)# no license smart privacy hostname
Device(config)# exit

Device# show license all
<output truncated>

Data Privacy:
  Sending Hostname: no
  Callhome hostname privacy: DISABLED
  Smart Licensing hostname privacy: ENABLED
  Version privacy: DISABLED

Transport:
  Type: Smart
  URL: https://smartreceiver.cisco.com/licservice/license
  Proxy:
  Not Configured
```

```
VRF:
  Not Configured
```

<output truncated>

Examples for Transport Type and URL

The following examples show how to configure some of the transport types using the **license smart transport** and the **license smart url** commands in global configuration mode. The accompanying **show license all** output displays configured information.

Transport: **cslu**:

```
Device# configure terminal
Device(config)# license smart transport cslu
Device(config)# license smart url default
Device(config)# exit
Device# show license all
<output truncated>
Transport:
  Type: cslu
  Cslu address: http://192.168.0.1:8182/cslu/v1/pi
  Proxy:
    Not Configured
<output truncated>
```

Transport: **smart**:

```
Device# configure terminal
Device(config)# license smart transport smart
Device(config)# license smart url smart https://smartreceiver.cisco.com/licservice/license
Device(config)# exit
Device# show license all
<output truncated>
Transport:
  Type: Smart
  URL: https://smartreceiver-stage.cisco.com/licservice/license
  Proxy:
    Not Configured
<output truncated>
```

Examples for Usage Reporting Options

The following examples show how to configure some of the usage reporting settings using the **license smart usage** command in global configuration mode. The accompanying **show running-config** output displays configured information.

Configuring the **customer-tag** option:

```
Device# configure terminal
Device(config)# license smart usage customer-tags tag1 SA/VA:01
Device(config)# exit
Device# show running-config | include tag1
license smart usage customer-tags tag1 SA/VA:01
```

Configuring a narrower reporting interval than the currently applied policy:

```
Device# show license status
<output truncated>
Usage Reporting:
Last ACK received: Sep 22 13:49:38 2020 PST
Next ACK deadline: Dec 21 12:02:21 2020 PST
Reporting push interval: 30 days
```

```
Next ACK push check: Sep 22 12:20:34 2020 PST
Next report push: Oct 22 12:05:43 2020 PST
Last report push: Sep 22 12:05:43 2020 PST
Last report file write: <none>
<output truncated>
```

```
Device# configure terminal
Device(config)# license smart usage interval 20
Device(config)# exit
Device# show license status
<output truncated>
```

```
Usage Reporting:
Last ACK received: Sep 22 13:49:38 2020 PST
Next ACK deadline: Nov 22 12:02:21 2020 PST
Reporting push interval: 20 days
Next ACK push check: Sep 22 12:20:34 2020 PST
Next report push: Oct 12 12:05:43 2020 PST
Last report push: Sep 22 12:05:43 2020 PST
Last report file write: <none>
<output truncated>
```

license smart (privileged EXEC)

To configure licensing functions such as requesting or returning authorization codes, saving Resource Utilization Measurement reports (RUM reports), importing a file on to a product instance, establishing trust with Cisco Smart Software Manager (CSSM), synchronizing the product instance with CSSM, or Cisco Smart License Utility (CSLU), or Smart Software Manager On-Prem (SSM On-Prem), and removing licensing information from the product instance, enter the **license smart** command in privileged EXEC mode with the corresponding keyword or argument.

```
license smart { authorization { request { add | replace | save path } feature_name { all | local } | return
{ all | local } } { offline [ path ] | online } } | clear eventlog | export return { all | local } feature_name
| factory reset | import file_path | save { trust-request filepath_filename | usage { all | days days | rum-id
rum-ID | unreported } { file file_path } } | sync { all | local } | trust idtoken id_token_value { local | all
} [ { force } ] }
```

| Syntax Description | smart | Provides options for Smart Licensing. |
|--------------------|-------------------------------|--|
| | authorization | Provides the option to request for, or return, authorization codes. Authorization codes are required <i>only</i> if you use licenses with enforcement type: export-controlled or enforced. |
| | request | Requests an authorization code from CSSM, CSLU (CSLU in-turn fetches it from CSSM), or SSM On-Prem and installs it on the product instance. |
| | add | Adds the requested license to the existing authorization code. The new authorization code will contain all the licenses of the existing authorization code and the requested license. |
| | replace | Replaces the existing authorization code. The new authorization code will contain only the requested license. All licenses in the current authorization code are returned. When you enter this option, the product instance verifies if licenses that correspond to the authorization codes that will be removed, are in-use. If licenses are being used, an error message tells you to first disable the corresponding features. |
| | save filepath_filename | Saves the authorization code request to a file. For <i>filepath_filename</i> , specify the absolute path to the file, including the filename. |
| | <i>feature_name</i> | Name of the license for which you are requesting an authorization code. |
| | all | Performs the action for all product instances in a High Availability or stacking set-up. |
| | local | Performs the action for the <i>active</i> product instance. This is the default option. |
| | return | Returns an authorization code back to the license pool in CSSM. |

| | |
|--|--|
| offline <i>filepath_filename</i> | <p>Means the product instance is not connected to CSSM. The authorization code is returned offline. This option requires you to print the return code to a file.</p> <p>Optionally, you can also specify a path to save the file. The file format can be any readable format, such as <code>.txt</code>.</p> <p>If you choose the offline option, you must complete the additional step of copying the return code from the CLI or the saved file and entering it in CSSM.</p> |
| online | Means that the product instance is in a connected mode. The authorization code is returned to CSLU or CSSM directly. |
| clear eventlog | Clears all event log files from the product instance. |
| export return | Although visible on the CLI, this command is not applicable in the Smart Licensing Using Policy environment. Use the license smart authorization return privileged EXEC command to return an authorization code instead. |
| factory reset | Clears all saved licensing information from the product instance. |
| import <i>filepath_filename</i> | <p>Imports a file on to the product instance. The file may be that of an authorization code, a trust code, or, or a policy.</p> <p>For <i>filepath_filename</i>, specify the location, including the filename.</p> |
| save | Provides options to save RUM reports or trust code requests. |
| trust-request <i>filepath_filename</i> | <p>Saves the trust code request for the active product instance in the specified location.</p> <p>For <i>filepath_filename</i>, specify the absolute path to the file, including the filename.</p> |
| usage { all days <i>days</i> rum-id <i>rum-ID</i> unreported } { file <i>file_path</i> } | <p>Saves RUM reports (license usage information) in the specified location. You must specify one of these options:</p> <ul style="list-style-type: none"> • all: Saves all RUM reports. • days <i>days</i>: Saves RUM report for the last <i>n</i> number of days (excluding the current day). Enter a number. The valid range is 0 to 4294967295. For example, if you enter 3, RUM reports of the last three days are saved. • rum-Id <i>rum-ID</i>: Saves a specified RUM ID. The valid value range is 0 to 18446744073709551615. • unreported: Saves all unreported RUM reports. <p>file <i>filepath_filename</i>: Saves the specified usage information to a file. Specify the absolute path to the file, including the filename.</p> |

sync { all | local } Synchronizes with CSSM or CSLU, or SSM On-Prem, to send and receive any pending data. This includes uploading pending RUM reports, downloading the ACK response, any pending authorization codes, trust codes, and policies for the product instance.

Specify the product instance by entering one of these options:

- **all**: Performs synchronization for all the product instances in a High Availability or stacking set-up. If you choose this option, the product instance also sends the list of all the UDIs in the synchronization request.
- **local**: Performs synchronization only for the active product instance sending the request, that is, its own UDI. This is the default option.

trust idtoken
id_token_value Establishes a trusted connection with CSSM.
To use this option, you must first generate a token in the CSSM portal. Provide the generated token value for *id_token_value*.

force Submits a trust code request even if a trust code already exists on the product instance.
A trust code is node-locked to the UDI of a product instance. If the UDI is already registered, CSSM does not allow a new registration for the same UDI. Entering the **force** keyword overrides this behavior.

Command Default

Cisco IOS XE Amsterdam 17.3.1 and earlier: Smart Licensing is enabled by default.

Cisco IOS XE Amsterdam 17.3.2a and later: Smart Licensing Using Policy is enabled by default.

Command Modes

Privileged EXEC (Device#)

Command History

| Release | Modification |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |

| Release | Modification |
|-----------------------------------|--|
| Cisco IOS XE Amsterdam 17.3.2a | <p>The following keywords and variables were introduced with Smart Licensing Using Policy:</p> <ul style="list-style-type: none"> • authorization { request { add replace } <i>feature_name</i> { all local } return { all local } { offline [<i>path</i>] online } } • import <i>file_path</i> • save { trust-request <i>filepath_filename</i> usage { all days <i>days</i> rum-id <i>rum-ID</i> unreported } { file <i>file_path</i> } } • sync { all local } • trust idtoken <i>id_token_value</i> { local all } [force] <p>The following keywords and variables under the license smart command are deprecated and no longer available on the CLI:</p> <ul style="list-style-type: none"> • register idtoken <i>token_id</i> [force] • deregister • renew id { ID auth } • debug { error debug trace all } • mfg reservation { request install install file cancel } • conversion { start stop } |
| Cisco IOS XE Amsterdam 17.3.3 | Support for SSM On-Prem was introduced. You can perform licensing-related tasks such as saving Resource Utilization Measurement reports (RUM reports), importing a file on to a product instance, synchronizing the product instance, returning authorization codes, and removing licensing information from the product instance in an SSM On-Prem deployment. |
| Cisco IOS XE Bengaluru 17.6.2 | Support for the Export Control Key for High Security (HSECK9 key) was introduced on the Cisco Catalyst 9300X Series Switches. The authorization code related commands (license smart authorization request and license smart authorization return) can be used to request and return the Smart Licensing Authorization Code (SLAC) for the HSECK9 key, on supported platforms. |
| Cisco IOS XE Cupertino 17.7.1 | <p>The following enhancements were introduced in this release:</p> <ul style="list-style-type: none"> • The save path keyword and variable were added to the license smart authorization request command string. You can use this option to generate a SLAC request and save it to a file. The new options are displayed as follows: <ul style="list-style-type: none"> license smart authorization request { add replace save path } <i>feature_name</i> { all local } <i>request_count</i> • The existing license smart save usage command was enhanced to automatically include a trust code request if it doesn't already exist. |

| Release | Modification |
|-------------------------------|--|
| Cisco IOS XE Cupertino 17.8.1 | <p>The authorization code related commands (license smart authorization request and license smart authorization return) were implemented on the following products:</p> <ul style="list-style-type: none"> • Cisco Catalyst 9600 Series 40-Port 50G, 2-Port 200G, 2-Port 400G Line Card (C9600-LC-40YL4CD) • Cisco Catalyst 9500X Series Switches <p>You can use the above commands to request and return the Smart Licensing Authorization Code (SLAC) for the HSECK9 key on supported platforms.</p> |
| Cisco IOS XE Dublin 17.11.1 | <p>The HSECK9 key was implemented on Cisco Catalyst 9400 Series Supervisor 2 and 2XL Modules (C9400X-SUP-2 and C9400X-SUP-2XL)</p> <p>The authorization code related commands (license smart authorization request and license smart authorization return) can be used to request and return the Smart Licensing Authorization Code (SLAC) for the HSECK9 key, on supported platforms.</p> |

Usage Guidelines

Requesting a Trust Code in an Air-Gapped Network

Starting with Cisco IOS XE Cupertino 17.7.1 if a trust code is not available on the product instance, the product instance automatically includes a trust code request in the RUM report when you enter the **license smart save usage** command. This is supported in a standalone set-up, as well as a High Availability and stacking set-up. In a High Availability and stacking set-up, the active product instance requests and installs the trust code for all members or standbys where a trust code is missing. CSSM includes the trust code in the ACK which is available for download from the CSSM Web UI. You then have to install the ACK on the product instance. You can verify trust code installation by entering the **show license status** command in privileged EXEC mode - check for the updated timestamp in the `Trust Code Installed` field.

Overwriting a Trust Code

Use cases for the **force** option when configuring the **license smart trust idtoken** command:

- You use same token for all the product instances that are part of one Virtual Account. If the product instance has moved from one account to another (for instance, because it was added to a High Availability set-up, which is part of another Virtual Account), then there may be an existing trust code you have to overwrite.
- There is already a factory-installed trust code on the product instance, but you want to implement a topology where the product instance is directly connected to CSSM. A factory-installed trust code cannot be used for secure communication with CSSM. You must generate an ID token in the CSSM Web UI and download a trust code file. When you install this new trust code, you must overwrite the existing factory-installed trust code.

Removing Licensing Information

Entering the **license smart factory reset** command removes all licensing information (except the licenses in-use) from the product instance, including any authorization codes, RUM reports etc. Therefore, we recommend the use of this command only if the product instance is being returned (Return Material Authorization, or RMA), or being decommissioned permanently. We also recommend that you return any authorization codes and send a RUM report to CSSM, before you remove licensing information from the product instance - this is to ensure that CSSM has up-to-date usage information.

Requesting and Returning Authorization Codes:

- Requesting and returning SLAC - when the product instance is connected to CSSM, or CSLU or SSM On-Prem:
 - Use the following command to request SLAC on supported product instances. In a stacking set-up, you can request SLAC for either the active (**local**), or the entire stack (**all**). You cannot request SLAC for just one member or standby. Here the product instance is connected to CSSM, or CSLU or SSM On-Prem. For air-gapped networks, you must enter the required details directly in CSSM to generated SLAC.

```
license smart authorization request { add | replace } feature_name { all | local }
```

- Use the following command to return a SLAC or an SLR authorization code:

```
license smart authorization return { all | local } { online }
```

- Requesting and returning a SLAC when the product instance is in an air-gapped network.
 - Starting from Cisco IOS XE Cupertino 17.7.1

You can request and install a SLAC without having to enter the required PIDs or generating a SLAC in the CSSM Web UI. Instead, save a SLAC request in a file by configuring the **license smart authorization request** { **add** | **replace** } *feature_name* { **all** | **local** }, followed by the **license smart authorization request save** [*path*] commands.

Upload the SLAC request file, to the CSSM Web UI (in the same location and just as you would, a RUM report). After the request is processed, a SLAC file is available on the CSSM Web UI. Download, and import the SLAC file into the product instance.

Similarly, to return a SLAC configure the **license smart authorization return** command with the **offline** [*path*] option to save the file. Upload the file to the CSSM Web UI in the same location and just as you would, a RUM report).

- Prior to Cisco IOS XE Cupertino 17.7.1:

To request SLAC on a product instance in an air-gapped network, you must enter the required details directly in the CSSM Web UI to generate SLAC.

To return a SLAC or an SLR authorization code:

```
license smart authorization return { all | local } { offline [ path ] | online }
```

Copy the return code that is displayed on the CLI and enter it in CSSM. If you save the return code to a file, you can copy the code from the file and enter the same in CSSM.

For SLR authorization codes in the Smart Licensing Using Policy environment, note that you cannot request a new SLR in the Smart Licensing Using Policy environment, because the notion of “reservation” does not apply. If you are in an air-gapped network, the *No Connectivity to CSSM* and *No CSLU* topology applies instead.

Authorization Codes in an SSM On-Prem Deployment

When requesting SLAC in an SSM On-Prem Deployment, ensure that you meet the following prerequisites before you configure the **license smart authorization request** command:

- The product instance must be added to SSM On-Prem. The process of addition validates and maps the product instance to the applicable Smart Account and Virtual account in CSSM.
- The authorization codes required for export-controlled and enforced licenses must be generated in CSSM and imported into SSM On-Prem.

Examples

- [Example for Requesting SLAC \(Connected Directly to CSSM\), on page 2063](#)
- [Example for Saving Licensing Usage Information, on page 2064](#)
- [Example for Installing a Trust Code, on page 2064](#)
- [Example for Returning an SLR Authorization Code, on page 2065](#)

Example for Requesting SLAC (Connected Directly to CSSM)

The following example shows how you can request and install SLAC on a product instance that is directly connected to CSSM. This example is of a stacking set-up with an active, a standby, and a member - all the devices in the stack are C9300X and support the HSECK9 key and IPsec. IPsec is a cryptographic feature which requires the HSECK9 key. A SLAC is requested for all the product instances in the set-up.

```
Device# license smart authorization request add hseck9 all
Device#

```

Example: Requesting a SLAC and Returning a SLAC (No Connectivity to CSSM and No CSLU)

The following examples show you how to generate and save a SLAC request on the product instance and also how to return a SLAC to the CSSM Web UI, for a product instance in an air-gapped network. The software version running on the product instance is Cisco IOS XE Cupertino 17.7.1, which introduces support for a more simplified way of requesting and returning SLAC in an air-gapped network.

Requesting a SLAC

```
Device# license smart authorization request add hseck9 local
Device# license smart authorization request save bootflash:slac-request.txt
```

After the above steps, upload the file to the CSSM Web UI. From the CSSM Web UI, download the file containing the SLAC. To import and install the file on the product instance, enter the following commands:

```
Device# copy tftp://10.8.0.6/user01/slac_code.txt bootflash:
Device# license smart import bootflash:slac_code.txt
```

Returning a SLAC

```
Device# license smart authorization return local offline bootflash:auth_return.txt
```

After the above step, upload the file to the CSSM Web UI. A file is available for download after this, but import and installation of this file is optional.

Example for Saving Licensing Usage Information

The following example shows how you can save license usage information on the product instance. You can use this option to fulfil reporting requirements in an air-gapped network. In the example, the file is first save to flash memory and then copied to a TFTP location:

```
Device> enable
Device# license smart save usage unreported file flash:RUM-unrep.txt
Device# copy flash:RUM-unrep.txt tftp://192.168.0.1//auto/tftp-user/user01/
Address or name of remote host [192.168.0.1]?
Destination filename [//auto/tftp-user/user01/RUM-unrep.txt]?
!!
15128 bytes copied in 0.161 secs (93963 bytes/sec)
```

After you save RUM reports to a file, you must upload it to CSSM (from a workstation that has connectivity to the internet, and Cisco).

Example for Installing a Trust Code

The following example shows how to install a trust code even if one is already installed on the product instance. This requires connectivity to CSSM. The accompanying **show license status** output shows sample output after successful installation:

Before you can install a trust code, you must generate a token and download the corresponding file from CSSM.

Use the **show license status** command (Trust Code Installed:) to verify results.

```

Device> enable
Device# license smart trust idtoken
NGMwMjk5mYtNZaxMS00NzMZmtgWm local force
Device# show license status
<output truncated>
Trust Code Installed:
  Active: PID:C9500-24Y4C,SN:CAT2344L4GH
         INSTALLED on Sep 04 01:01:46 2020 EDT
  Standby: PID:C9500-24Y4C,SN:CAT2344L4GJ
         INSTALLED on Sep 04 01:01:46 2020 EDT
<output truncated>

```

Example for Returning an SLR Authorization Code

The following example shows how to remove and return an SLR authorization code. Here the code is returned offline (no connectivity to CSSM). The accompanying **show license all** output shows sample output after successful return:

```

Device> enable
Device# license smart authorization return local offline
Enter this return code in Cisco Smart Software Manager portal:
UDI: PID:C9500-16X,SN:FCW2233A5ZV
Return code: Cr9JHx-L1x5Rj-ftwzgl-h9QZAU-LE5DT1-babWeL-FABPt9-Wr1Dn7-Rp7
Device# configure terminal
Device(config)# no license smart reservation

Device# show license all
<output truncated>
License Authorizations
=====
Overall status:
  Active: UDI: PID:C9500-16X,SN:FCW2233A5ZV
         Status: NOT INSTALLED
         Last return code: Cr9JHx-L1x5Rj-ftwzgl-h9QZAU-LE5DT1-babWeL-FABPt9-Wr1Dn7-Rp7
<output truncated>

```

Since the product instance is in an air-gapped network, you must copy the return code from the CLI, locate the product instance in the CSSM Web UI and enter the return code there to complete the return process.

line auto-consolidation

To consolidate multiple line configurations of the same submode into a single line, use the **line auto-consolidation** command in global configuration mode. Auto-consolidation of line configurations is enabled by default. Starting with the Cisco IOS XE Bengaluru 17.4.1 you can disable auto consolidation by using the **no** form of the command.

line auto-consolidation
no line auto-consolidation

| | | |
|---------------------------|--|---|
| Syntax Description | auto-consolidation | Consolidates multiple line configurations of the same submode into a single line. |
| Command Default | Autoconsolidation is enabled by default. | |
| Command Modes | Global configuration mode (config) | |
| Command History | Release | Modification |
| | Cisco IOS XE Bengaluru 17.4.1 | The command was introduced. |

The following example shows the nonvolatile generation (NVGEN) process output with **line auto-consolidation** configured:

```
Device# show run | sec line
line con 0
stopbits 1
line vty 0 4
transport input ssh
line vty 5 9
transport input all
Device# configure terminal
Device(config)# line vty 10 15
Device(config-line)# transport input all
Device(config-line)# end
Device# show run | sec line
line con 0
stopbits 1
line vty 0 4
transport input ssh
line vty 5 15
transport input all
```

The following example shows the nonvolatile generation (NVGEN) process output after **no line auto-consolidation** is configured:

```
Device# show run | sec line
line con 0
stopbits 1
line vty 0 4
transport input ssh
line vty 5 9
transport input all
Device# configure terminal
```

```
Device(config)#no line auto-consolidation
Device(config)# line vty 10 15
Device(config-line)# transport input all
Device(config-line)# end
Device# show run | sec line
no line auto-consolidation
line con 0
stopbits 1
line vty 0 4
transport input ssh
line vty 5 9
transport input all
line vty 10 15
transport input all
```

location

To configure location information for an endpoint, use the **location** command in global configuration mode. To remove the location information, use the **no** form of this command.

```
location {admin-tag string | civic-location identifier {hostid} | civic-location identifier {hostid} |
elin-location {string | identifier id} | geo-location identifier {hostid} | prefer {cdp weight
priority-value | lldp-med weight priority-value | static config weight priority-value}
no location {admin-tag string | civic-location identifier {hostid} | civic-location identifier {hostid} |
elin-location {string | identifier id} | geo-location identifier {hostid} | prefer {cdp weight
priority-value | lldp-med weight priority-value | static config weight priority-value}
```

| Syntax Description | | |
|-----------------------|---------------|---|
| admin-tag | <i>string</i> | Configures administrative tag or site information. Site or location information in alphanumeric format. |
| civic-location | | Configures civic location information. |
| identifier | | Specifies the name of the civic location, emergency, or geographical location. |
| host | | Defines the host civic or geo-spatial location. |
| <i>id</i> | | Name of the civic, emergency, or geographical location. |
| | Note | The identifier for the civic location in the LLDP-MED switch TLV is limited to 250 bytes or less. To avoid error messages about available buffer space during switch configuration, be sure that the total length of all civic-location information specified for each civic-location identifier does not exceed 250 bytes. |
| elin-location | | Configures emergency location information (ELIN). |
| geo-location | | Configures geo-spatial location information. |
| prefer | | Sets location information source priority. |

Command Default No default behavior or values.

Command Modes Global configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines After entering the **location civic-location identifier** global configuration command, you enter civic location configuration mode. After entering the **location geo-location identifier** global configuration command, you enter geo location configuration mode.

The civic-location identifier must not exceed 250 bytes.

The host identifier configures the host civic or geo-spatial location. If the identifier is not a host, the identifier only defines a civic location or geo-spatial template that can be referenced on the interface.

The **host** keyword defines the device location. The civic location options available for configuration using the **identifier** and the **host** keyword are the same. You can specify the following civic location options in civic location configuration mode:

- **additional-code**—Sets an additional civic location code.
- **additional-location-information**—Sets additional civic location information.
- **branch-road-name**—Sets the branch road name.
- **building**—Sets building information.
- **city**—Sets the city name.
- **country**—Sets the two-letter ISO 3166 country code.
- **county**—Sets the county name.
- **default**—Sets a command to its defaults.
- **division**—Sets the city division name.
- **exit**—Exits from the civic location configuration mode.
- **floor**—Sets the floor number.
- **landmark**—Sets landmark information.
- **leading-street-dir**—Sets the leading street direction.
- **name**—Sets the resident name.
- **neighborhood**—Sets neighborhood information.
- **no**—Negates the specified civic location data and sets the default value.
- **number**—Sets the street number.
- **post-office-box**—Sets the post office box.
- **postal-code**—Sets the postal code.
- **postal-community-name**—Sets the postal community name.
- **primary-road-name**—Sets the primary road name.
- **road-section**—Sets the road section.
- **room**—Sets room information.
- **seat**—Sets seat information.
- **state**—Sets the state name.
- **street-group**—Sets the street group.
- **street-name-postmodifier**—Sets the street name postmodifier.
- **street-name-premodifier**—Sets the street name premodifier.
- **street-number-suffix**—Sets the street number suffix.
- **street-suffix**—Sets the street suffix.
- **sub-branch-road-name**—Sets the sub-branch road name.
- **trailing-street-suffix**—Sets the trailing street suffix.
- **type-of-place**—Sets the type of place.
- **unit**—Sets the unit.

You can specify the following geo-spatial location information in geo-location configuration mode:

- **altitude**—Sets altitude information in units of floor, meters, or feet.
- **latitude**—Sets latitude information in degrees, minutes, and seconds. The range is from -90 degrees to 90 degrees. Positive numbers indicate locations north of the equator.

- **longitude**—Sets longitude information in degrees, minutes, and seconds. The range is from -180 degrees to 180 degrees. Positive numbers indicate locations east of the prime meridian.
- **resolution**—Sets the resolution for latitude and longitude. If the resolution value is not specified, default value of 10 meters is applied to latitude and longitude resolution parameters. For latitude and longitude, the resolution unit is measured in meters. The resolution value can also be a fraction.
- **default**—Sets the geographical location to its default attribute.
- **exit**—Exits from geographical location configuration mode.
- **no**—Negates the specified geographical parameters and sets the default value.

Use the **no lldp med-tlv-select location information** interface configuration command to disable the location TLV. The location TLV is enabled by default.

This example shows how to configure civic location information on the switch:

```
Device(config)# location civic-location identifier 1
Device(config-civic)# number 3550
Device(config-civic)# primary-road-name "Cisco Way"
Device(config-civic)# city "San Jose"
Device(config-civic)# state CA
Device(config-civic)# building 19
Device(config-civic)# room C6
Device(config-civic)# county "Santa Clara"
Device(config-civic)# country US
Device(config-civic)# end
```

You can verify your settings by entering the **show location civic-location** privileged EXEC command.

This example shows how to configure the emergency location information on the switch:

```
Device(config)# location elin-location 14085553881 identifier 1
```

You can verify your settings by entering the **show location elin** privileged EXEC command.

The example shows how to configure geo-spatial location information on the switch:

```
Device(config)# location geo-location identifier host
Device(config-geo)# latitude 12.34
Device(config-geo)# longitude 37.23
Device(config-geo)# altitude 5 floor
Device(config-geo)# resolution 12.34
```

You can use the **show location geo-location identifier** command to display the configured geo-spatial location details.

location plm calibrating

To configure path loss measurement (CCX S60) request for calibrating clients, use the **location plm calibrating** command in global configuration mode.

location plm calibrating {**multiband** | **uniband**}

| Syntax Description | multiband | uniband |
|--------------------|---|--|
| | Specifies the path loss measurement request for calibrating clients on the associated 802.11a or 802.11b/g radio. | Specifies the path loss measurement request for calibrating clients on the associated 802.11a/b/g radio. |

Command Default No default behavior or values.

Command Modes Global configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The uniband is useful for single radio clients (even if the radio is a dual band and can operate in the 2.4-GHz and the 5-GHz bands). The multiband is useful for multiple radio clients.

This example shows how to configure the path loss measurement request for calibrating clients on the associated 802.11a/b/g radio:

```
Device# configure terminal
Device(config)# location plm calibrating uniband
Device(config)# end
```

mac address-table move update

To enable the MAC address table move update feature, use the **mac address-table move update** command in global configuration mode on the switch stack or on a standalone switch. To return to the default setting, use the **no** form of this command.

```
mac address-table move update {receive | transmit}
no mac address-table move update {receive | transmit}
```

| Syntax Description | receive Specifies that the switch processes MAC address-table move update messages. | | | | |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| | transmit Specifies that the switch sends MAC address-table move update messages to other switches in the network if the primary link goes down and the standby link comes up. | | | | |
| Command Default | By default, the MAC address-table move update feature is disabled. | | | | |
| Command Modes | Global configuration | | | | |
| Command History | | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines The MAC address-table move update feature allows the switch to provide rapid bidirectional convergence if a primary (forwarding) link goes down and the standby link begins forwarding traffic.

You can configure the access switch to send the MAC address-table move update messages if the primary link goes down and the standby link comes up. You can configure the uplink switches to receive and process the MAC address-table move update messages.

Examples

This example shows how to configure an access switch to send MAC address-table move update messages:

```
Device# configure terminal
Device(config)# mac address-table move update transmit
Device(config)# end
```

This example shows how to configure an uplink switch to get and process MAC address-table move update messages:

```
Device# configure terminal
Device(config)# mac address-table move update receive
Device(config)# end
```

You can verify your setting by entering the **show mac address-table move update** privileged EXEC command.

mgmt_init

To initialize the Ethernet management port, use the **mgmt_init** command in boot loader mode.

mgmt_init

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes Boot loader

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **mgmt_init** command only during debugging of the Ethernet management port.

Examples This example shows how to initialize the Ethernet management port:

```
Device: mgmt_init
```

mkdir

To create one or more directories on the specified file system, use the **mkdir** command in boot loader mode.

mkdir *filesystem:/directory-url...*

| | |
|---------------------------|--|
| Syntax Description | <i>filesystem:</i> Alias for a file system. Use usbflash0: for USB memory sticks. |
| | <i>/directory-url...</i> Name of the directories to create. Separate each directory name with a space. |

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-------------|
| Command Modes | Boot loader |
|----------------------|-------------|

| | | |
|------------------------|-----------------------------|------------------------------|
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | <p>Directory names are case sensitive.</p> <p>Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.</p> |
|-------------------------|---|

Example

This example shows how to make a directory called Saved_Configs:

```
Device: mkdir usbflash0:Saved_Configs
Directory "usbflash0:Saved_Configs" created
```

more

To display the contents of one or more files, use the **more** command in boot loader mode.

more *filesystem:/file-url...*

Syntax Description

filesystem: Alias for a file system. Use **flash**: for the system board flash device.

/file-url... Path (directory) and name of the files to display. Separate each filename with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Filenames and directory names are case sensitive.

If you specify a list of files, the contents of each file appears sequentially.

Examples

This example shows how to display the contents of a file:

```
Device: more flash:image_file_name
version_suffix: universal-122-xx.SEx
version_directory: image_file_name
image_system_type_id: 0x00000002
image_name: image_file_name.bin
ios_image_file_size: 8919552
total_image_file_size: 11592192
image_feature: IP|LAYER_3|PLUS|MIN_DRAM_MEG=128
image_family: family
stacking_number: 1.34
board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b
info_end:
```

no debug all

To disable debugging on a switch, use the **no debug all** command in Privileged EXEC mode.

no debug all

Command Default No default behavior or values.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|------------------------|---------------------------|------------------------------|
| | Cisco IOS XE Release 16.1 | This command was introduced. |

Examples

This example shows how to disable debugging on a switch.

```
Device: no debug all
All possible debugging has been turned off.
```

power budget mode

To configure the system to reserve power for a single supervisor, use the **power budget mode** command in global configuration mode

```
power budget mode
single-sup
no power budget mode
single-sup
```

Command Default The system reserves power for both supervisor modules.

Command Modes Global configuration mode (config)

| Command History | Release | Modification |
|-----------------|---------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

Usage Guidelines Before you configure the command to reserve power for a single supervisor, ensure that these prerequisites are met:

- You have installed only one supervisor module in the chassis
- You have installed a blank in the second supervisor slot

Further guidelines related to power budgeting are available in the [software configuration guide](#). In applicable version of the guide, go to **Contents** → **System Management** → **Environmental Monitoring and Power Management** → **Power Budgeting for Supervisor Modules**.

Examples

The following example shows how you can reserve power for a single supervisor module:

```
Device# configure terminal
Device(config)# power budget mode single-sup
Device(config)# end
```

power supply autolc

To configure automatic line card (autoLC) shutdown in the event of a power constraint, and to configure line card power priority, use the **power supply autolc** command in global configuration mode. To disable automatic line card shutdown and to use default line card power priority, use the **no** form of this command.

```
power supply autolc [ priority physical-slot-number ] [ shutdown ]
no power supply autolc [ priority physical-slot-number ] [ shutdown ]
```

Syntax Description

priority *physical-slot-number* Configures line card power priority. Enter the physical line card slot numbers to indicate line card power priority. Valid values are from 1 to 10.

The system assigns the highest priority (0) to the slot number you enter first, and this is the *last* to be shut down in case of a failure.

The system does not accept a partial list of line card slot numbers. For example, for a 7-slot chassis, you must indicate the order by including all the five line card slots.

If you do not specify an order and autoLC shutdown is enabled, then by default the system shuts down line cards from the highest to the lowest physical slot number. Accordingly, default configuration is as follows:

- 4-slot chassis: power supply autoLC priority 1 4
- 7-slot chassis: power supply autoLC priority 1 2 5 6 7
- 10-slot chassis: power supply autoLC priority 1 2 3 4 7 8 9 10

shutdown Enables automatic shutdown of line cards in case of a power supply failure event.

Command Default

- Cisco IOS XE Gibraltar 16.11.x and all earlier releases: autoLC shutdown is disabled by default.
- Cisco IOS XE Gibraltar 16.12.1 and all later releases: autoLC shutdown is perpetually enabled and cannot be disabled.

Command Modes

Global configuration (config)

Command History

| Release | Modification |
|--------------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Gibraltar 16.11.x | Starting from this release, the power supply autolc shutdown command is always enabled and cannot be disabled. The no form of the command is also obsolete from this release. |

Examples

The following example shows you how to configure line card power priority.

The first part of the example shows sample output of default configuration on a 10-slot chassis. The second part of the example shows how to specify power priority on the same 10-slot chassis and sample output of the **show** command to display and verify changed configuration.

The following sample output displays default line card power priority configuration. Here, in case of a power failure:

- Physical slot number 10 (C9400-LC-24XS) will be shut down first, because has the lowest priority (7)
- Physical slot number 1 (C9400-LC-48U) will be shut down last, because it has the highest priority (0).

```
Device# show power module
Automatic Linecard Shutdown : Enabled

Power Budget Mode           : Dual Sup
```

| Mod | Model No | autoLC Priority | Power State | Budget | Instantaneous | Peak | Out of Reset | In Reset |
|-------|---------------|--------------------|----------------|--------|---------------|------|-----------------|-------------|
| 1 | C9400-LC-48U | 0 | accepted | 500 | 36 | 37 | 500 | 5 |
| 2 | C9400-LC-48H | 1 | accepted | 240 | 34 | 39 | 240 | 5 |
| 3 | C9400-LC-48P | 2 | accepted | 500 | 36 | 41 | 500 | 5 |
| 4 | C9400-LC-48UX | 3 | accepted | 500 | 137 | 149 | 500 | 15 |
| 5 | C9400-SUP-1XL | 0 | accepted | 400 | 253 | 270 | 400 | 130 |
| 6 | C9400-SUP-1XL | 0 | accepted | 400 | 251 | 270 | 400 | 130 |
| 7 | C9400-LC-48T | 4 | accepted | 240 | 34 | 35 | 240 | 5 |
| 8 | C9400-LC-48S | 5 | accepted | 240 | 39 | 39 | 240 | 5 |
| 9 | C9400-LC-24S | 6 | accepted | 240 | 34 | 35 | 240 | 5 |
| 10 | C9400-LC-24XS | 7 | accepted | 240 | 95 | 96 | 240 | 10 |
| -- | Fan Tray | 0 | accepted | 700 | -- | -- | 700 | -- |
| Total | 4200 | | | | | | | |

The following sample configuration shows how to specify line card power priority on a 10-slot chassis. Here, in case of a power failure:

- Physical slot number 1 (C9400-LC-48U) will be shut down first, because it has the lowest priority (7)
- Physical slot number 10 (C9400-LC-24XS) will be shut down last, because has the lowest priority (0).

```
Device# configure terminal
Device(config)# power supply autoLC priority 10 9 8 7 4 3 2 1
Device(config)# end
```

```
Device# show power module
Automatic Linecard Shutdown : Enabled
Power Budget Mode           : Dual Sup
```

| Mod | Model No | autoLC Priority | Power State | Budget | Instantaneous | Peak | Out of Reset | In Reset |
|-----|---------------|--------------------|----------------|--------|---------------|------|-----------------|-------------|
| 1 | C9400-LC-48U | 7 | accepted | 500 | 36 | 37 | 500 | 5 |
| 2 | C9400-LC-48H | 6 | accepted | 240 | 34 | 39 | 240 | 5 |
| 3 | C9400-LC-48P | 5 | accepted | 500 | 36 | 41 | 500 | 5 |
| 4 | C9400-LC-48UX | 4 | accepted | 500 | 137 | 149 | 500 | 15 |
| 5 | C9400-SUP-1XL | 0 | accepted | 400 | 253 | 270 | 400 | 130 |
| 6 | C9400-SUP-1XL | 0 | accepted | 400 | 251 | 270 | 400 | 130 |
| 7 | C9400-LC-48T | 3 | accepted | 240 | 34 | 35 | 240 | 5 |
| 8 | C9400-LC-48S | 2 | accepted | 240 | 39 | 39 | 240 | 5 |
| 9 | C9400-LC-24S | 1 | accepted | 240 | 34 | 35 | 240 | 5 |
| 10 | C9400-LC-24XS | 0 | accepted | 240 | 95 | 96 | 240 | 10 |

```
-- Fan Tray          0      accepted 700  --          -- 700  --  
-----  
Total 4200
```

rename

To rename a file, use the **rename** command in boot loader mode.

```
rename filesystem:/source-file-url filesystem:/destination-file-url
```

Syntax Description

| | |
|------------------------------|---|
| <i>filesystem:</i> | Alias for a file system. Use usbflash0: for USB memory sticks. |
| <i>/source-file-url</i> | Original path (directory) and filename. |
| <i>/destination-file-url</i> | New path (directory) and filename. |

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Filenames and directory names are case sensitive.

Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Filenames are limited to 127 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Examples

This example shows a file named *config.text* being renamed to *config1.text*:

```
Device: rename usbflash0:config.text usbflash0:config1.text
```

You can verify that the file was renamed by entering the **dir filesystem:** boot loader command.

request consent-token accept-response shell-access

To submit the Consent Token response to a previously generated challenge, use the **request consent-token accept-response shell-access** command.

request consent-token accept-response shell-access *response-string*

Syntax Description

| Syntax | Description |
|------------------------|---|
| <i>response-string</i> | Specifies the character string representing the response. |

Command Modes Privileged EXEC mode (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

Usage Guidelines You must enter the response string within 30 minutes of challenge generation. If it is not entered, the challenge expires and a new challenge must be requested.

Example

The following is sample output from the **request consent-token accept-response shell-access** *response-string* command:

```
Device# request consent-token accept-response shell-access
% Consent token authorization success
*Jan 18 02:51:37.807: %CTOKEN-6-AUTH_UPDATE: Consent Token Update (authentication success:
Shell access 0).
```

request consent-token generate-challenge shell-access

To generate a Consent Token challenge for system shell access, use the **request consent-token generate-challenge shell-access** command.

request consent-token generate-challenge shell-access auth-timeout *time-validity-slot*

Syntax Description

| Syntax | Description |
|---|---|
| auth-timeout <i>time-validity-slot</i> | Specifies the time slot in minutes for which shell-access is requested. |

Command Modes Privileged EXEC mode (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

Usage Guidelines When the requested time-slot for system shell expires, the session gets terminated automatically.
The maximum authorization timeout for system shell access is seven days.

Example

The following is sample output from the **request consent-token generate-challenge shell-access auth-timeout *time-validity-slot*** command:

```
Device# request consent-token generate-challenge shell-access auth-timeout 900
Device#
*Jan 18 02:47:06.733: %CTOKEN-6-AUTH_UPDATE: Consent Token Update (challenge generation
attempt: Shell access 0).
```

request consent-token terminate-auth

To terminate the Consent Token based authorization to system shell, use the **request consent-token terminate-auth** command.

request consent-token terminate-auth

Command Modes Privileged EXEC mode (#)

| Command History | Release | Modification |
|------------------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

Usage Guidelines In system shell access scenario, exiting the shell does not terminate authorization until the authorization timeout occurs.

We recommend that you force terminate system shell authorization by explicitly issuing the **request consent-token terminate-auth** command once the purpose of system shell access is complete.

If the current authentication is terminated using the **request consent-token terminate-auth** command, the user will have to repeat the authentication process to gain access to system shell.

Example

The following is sample output from the **request consent-token terminate-auth** command:

```
Device# request consent-token terminate-auth shell-access
% Consent token authorization termination success

Device#
*Mar 13 01:45:39.197: %CTOKEN-6-AUTH_UPDATE: Consent Token Update (terminate authentication:
Shell access 0).
Device#
```

reset

To perform a hard reset on the system, use the **reset** command in boot loader mode. A hard reset is similar to power-cycling the device; it clears the processor, registers, and memory.

reset

| | |
|---------------------------|--|
| Syntax Description | This command has no arguments or keywords. |
|---------------------------|--|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-------------|
| Command Modes | Boot loader |
|----------------------|-------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

This example shows how to reset the system:

```
Device: reset
Are you sure you want to reset the system (y/n)? y
System resetting...
```

rmdir

To remove one or more empty directories from the specified file system, use the **rmdir** command in boot loader mode.

rmdir *filesystem:/directory-url...*

Syntax Description

filesystem: Alias for a file system. Use **usbflash0:** for USB memory sticks.

/directory-url... Path (directory) and name of the empty directories to remove. Separate each directory name with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Directory names are case sensitive and limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Before removing a directory, you must first delete all of the files in the directory.

The device prompts you for confirmation before deleting each directory.

Example

This example shows how to remove a directory:

```
Device: rmdir usbflash0:Test
```

You can verify that the directory was deleted by entering the **dir** *filesystem:* boot loader command.

sdm prefer

To specify the SDM template for use on the switch, use the **sdm prefer** command in global configuration mode.

```
sdm prefer
{ advanced }
```

| | |
|---------------------------|---|
| Syntax Description | advanced Supports advanced features such as NetFlow. |
|---------------------------|---|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|----------------------|
| Command Modes | Global configuration |
|----------------------|----------------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

In a stack, all stack members must use the same SDM template that is stored on the active .

When a new is added to a stack, the SDM configuration that is stored on the active overrides the template configured on an individual .

Example

This example shows how to configure the advanced template:

```
Device(config)# sdm prefer advanced
Device(config)# exit
Device# reload
```

service private-config-encryption

To enable private configuration file encryption, use the **service private-config-encryption** command. To disable this feature, use the **no** form of this command.

service private-config-encryption
no service private-config-encryption

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes Global configuration (config)

| Command History | Release | Modification |
|-----------------|---------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

Examples

The following example shows how to enable private configuration file encryption:

```
Device> enable
Device# configure terminal
Device(config)# service private-config-encryption
```

Related Commands

| Command | Description |
|--|---|
| show parser encrypt file status | Displays the private configuration encryption status. |

set

To set or display environment variables, use the **set** command in boot loader mode. Environment variables can be used to control the boot loader or any other software running on the device.

set *variable value*

Syntax Description

| | |
|---------------------------------|--|
| <i>variable</i> <i>value</i> | <p>Use one of the following keywords for <i>variable</i> and the appropriate value for <i>value</i>:</p> <p>MANUAL_BOOT—Decides whether the device boots automatically or manually.</p> <p>Valid values are 1/Yes and 0/No. If it is set to 0 or No, the boot loader attempts to automatically boot the system. If it is set to anything else, you must manually boot the device from the boot loader mode.</p> |
| | <p>BOOT <i>filesystem:/file-url</i>—Identifies a semicolon-separated list of executable files to try to load and execute when automatically booting.</p> <p>If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash: file system.</p> |
| | <p>ENABLE_BREAK—Allows the automatic boot process to be interrupted when the user presses the Break key on the console.</p> <p>Valid values are 1, Yes, On, 0, No, and Off. If set to 1, Yes, or On, you can interrupt the automatic boot process by pressing the Break key on the console after the flash: file system has initialized.</p> |
| | <p>HELPER <i>filesystem:/file-url</i>—Identifies a semicolon-separated list of loadable files to dynamically load during the boot loader initialization. Helper files extend or patch the functionality of the boot loader.</p> |
| | <p>PS1 <i>prompt</i>—Specifies a string that is used as the command-line prompt in boot loader mode.</p> |
| | <p>CONFIG_FILE flash: <i>/file-url</i>—Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.</p> |
| | <p>BAUD <i>rate</i>—Specifies the number of bits per second (b/s) that is used for the baud rate for the console. The Cisco IOS software inherits the baud rate setting from the boot loader and continues to use this value unless the configuration file specifies another setting. The range is from 0 to 128000 b/s. Valid values are 50, 75, 110, 150, 300, 600, 1200, 1800, 2000, 2400, 3600, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 56000, 57600, 115200, and 128000.</p> <p>The most commonly used values are 300, 1200, 2400, 9600, 19200, 57600, and 115200.</p> |
| | <p>SWITCH_NUMBER <i>stack-member-number</i>—Changes the member number of a stack member.</p> |
| | <p>SWITCH_PRIORITY <i>priority-number</i>—Changes the priority value of a stack member.</p> |

Command Default

The environment variables have these default values:

MANUAL_BOOT: No (0)

BOOT: Null string

ENABLE_BREAK: No (Off or 0) (the automatic boot process cannot be interrupted by pressing the **Break** key on the console).

HELPER: No default value (helper files are not automatically loaded).

PS1 device:

CONFIG_FILE: config.text

BAUD: 9600 b/s

SWITCH_NUMBER: 1

SWITCH_PRIORITY: 1

Note Environment variables that have values are stored in the flash: file system in various files. Each line in the files contains an environment variable name and an equal sign followed by the value of the variable.

A variable has no value if it is not listed in these files; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value.

Many environment variables are predefined and have default values.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Environment variables are case sensitive and must be entered as documented.

Environment variables that have values are stored in flash memory outside of the flash: file system.

Under typical circumstances, it is not necessary to alter the setting of the environment variables.

The MANUAL_BOOT environment variable can also be set by using the **boot manual** global configuration command.

The BOOT environment variable can also be set by using the **boot system filesystem:/file-url** global configuration command.

The ENABLE_BREAK environment variable can also be set by using the **boot enable-break** global configuration command.

The HELPER environment variable can also be set by using the **boot helper filesystem: /file-url** global configuration command.

The CONFIG_FILE environment variable can also be set by using the **boot config-file flash: /file-url** global configuration command.

The SWITCH_NUMBER environment variable can also be set by using the **switch current-stack-member-number renumber new-stack-member-number** global configuration command.

The SWITCH_PRIORITY environment variable can also be set by using the device *stack-member-number* **priority** *priority-number* global configuration command.

The boot loader prompt string (PS1) can be up to 120 printable characters not including the equal sign (=).

Example

This example shows how to set the SWITCH_PRIORITY environment variable:

```
Device: set SWITCH_PRIORITY 2
```

You can verify your setting by using the **set** boot loader command.

show avc client

To display information about top number of applications, use the **show avc client** command in privileged EXEC mode.

show avc client *client-mac* **top n application** [**aggregate** | **upstream** | **downstream**]

| Syntax Description | client <i>client-mac</i> Specifies the client MAC address. | | | | |
|---------------------------|--|---------|--------------|--|------------------------------|
| | top n application Specifies the number of top "N" applications for the given client. | | | | |
| Command Default | No default behavior or values. | | | | |
| Command Modes | Privileged EXEC | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td></td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | | This command was introduced. |
| Release | Modification | | | | |
| | This command was introduced. | | | | |

The following is sample output from the **show avc client** command:

```
# sh avc client 0040.96ae.65ec top 10 application aggregate
```

Cumulative Stats:

show bootflash:

To display information about the bootflash: file system, use the **show bootflash:** command in user EXEC or privileged EXEC mode.

show bootflash: [{**all** | **fileys** | **namesort** | **sizesort** | **timesort** }]

| Syntax Description | |
|--------------------|---|
| all | (Optional) Displays all possible Flash information. |
| fileys | (Optional) Displays Flash system information. |
| namesort | (Optional) Sorts the output by file name. |
| sizesort | (Optional) Sorts the output by file size. |
| timesort | (Optional) Sorts the output by time stamp. |

| Command Default | |

show cable-diagnostics tdr

To display the Time Domain Reflector (TDR) results, use the **show cable-diagnostics tdr** command in privileged EXEC mode.

show cable-diagnostics tdr interface *interface-id*

| | |
|---------------------------|--|
| Syntax Description | <i>interface-id</i> Specifies the interface on which TDR is run. |
|---------------------------|--|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-----------------|
| Command Modes | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|---|
| Usage Guidelines | TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and small form-factor pluggable (SFP) module ports. |
|-------------------------|---|

Examples

This example shows the output from the **show cable-diagnostics tdr interface** *interface-id* command on a device:

```
Device# show cable-diagnostics tdr interface gigabitethernet1/0/23
TDR test last run on: March 01 00:04:08
Interface  Speed  Local pair  Pair length          Remote pair  Pair status
-----
Gi1/0/23  1000M  Pair A     1 +/- 1 meters      Pair A      Normal
          Pair B     1 +/- 1 meters      Pair B      Normal
          Pair C     1 +/- 1 meters      Pair C      Normal
          Pair D     1 +/- 1 meters      Pair D      Normal
```

Table 205: Field Descriptions for the show cable-diagnostics tdr Command Output

| Field | Description |
|------------|---|
| Interface | The interface on which TDR is run. |
| Speed | The speed of connection. |
| Local pair | The name of the pair of wires that TDR is testing on the local interface. |

| Field | Description |
|-------------|---|
| Pair length | The location of the problem on the cable, with respect to your device. TDR can only find the location in one of these cases: <ul style="list-style-type: none"> • The cable is properly connected, the link is up, and the interface speed is 1000 Mb/s. • The cable is open. • The cable has a short. |
| Remote pair | The name of the pair of wires to which the local pair is connected. TDR can learn about the remote pair only when the cable is properly connected and the link is up. |
| Pair status | The status of the pair of wires on which TDR is running: <ul style="list-style-type: none"> • Normal—The pair of wires is properly connected. • Not completed—The test is running and is not completed. • Not supported—The interface does not support TDR. • Open—The pair of wires is open. • Shorted—The pair of wires is shorted. • ImpedanceMis—The impedance is mismatched. • Short/Impedance Mismatched—The impedance mismatched or the cable is short. • InProgress—The diagnostic test is in progress. |

This example shows the output from the **show interface** *interface-id* command when TDR is running:

```
Device# show interface gigabitethernet1/0/2
gigabitethernet1/0/2 is up, line protocol is up (connected: TDR in Progress)
```

This example shows the output from the **show cable-diagnostics tdr interface** *interface-id* command when TDR is not running:

```
# show cable-diagnostics tdr interface gigabitethernet1/0/2
% TDR test was never issued on gigabitethernet1/0/2
```

If an interface does not support TDR, this message appears:

```
% TDR test is not supported on device 1
```

show consistency-checker mcast

To run a consistency-checker and detect inconsistent states of software entries on Layer 2 multicast forwarding tables and Layer 3 multicast forwarding tables, run the **show consistency-checker mcast** command in privileged EXEC mode.

```
show consistency-checker mcast { l2m | l3m } start { all | vlan vlan-id { ipv4-address |
ipv6-address } } [{ recursive }]
```

| Syntax Description | |
|---|--|
| l2m | Layer 2 multicast forwarding tables are selected to run a consistency-checker. |
| l3m | Layer 3 multicast forwarding tables are selected to run a consistency-checker. |
| start | Starts the consistency-checker for Layer 2 multicast. <ul style="list-style-type: none"> • all : Starts the checker for entire table • vlan vlan-id { ipv4-address ipv6-address } : Starts the checker for the specified VLAN. |
| all | Starts the checker for entire table. |
| vlan vlan-id { ipv4-address ipv6-address } | Starts the checker for the specified VLAN. |
| recursive | Runs a recursive consistency-checker. |

Command Default No default behavior or values.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-------------------------------|--|
| | Cisco IOS XE Bengaluru 17.6.1 | This command was introduced. |
| | Cisco IOS XE Cupertino 17.7.1 | The keyword l3m was introduced to run consistency checker on Layer 3 multicast forwarding tables. |

Usage Guidelines The consistency checker has the following limitations:

- There is no command to abort or terminate the consistency checker. It will stop only once the full report has been displayed.
- FED hardware checks are partially implemented. Only errors in programming hardware will be reported.
- False Positive cases: When the consistency checker is running and a large number of feature table entry delete/add/modify actions occur (triggered via clear * or relearn), the consistency checker may report inconsistent or missing entries across processes. It can also switch off the stale reporting due to a large number of changes in table entries.

Example

The following is a sample output for the **show consistency-checker mcast l2m** command:

```
Device# show consistency-checker mcast l2m start vlan 900 229.1.1.1 recursive
Single entry scan started with Run_id: 2

*Feb 17 06:54:09.880: %IOSXE_FMANRP_CCK-6-FMANRP_COMPLETED: Consistency Check for Run-Id 2
is completed. Check 'show consistency-checker run-id 2'.

```

show consistency-checker mcast l3m

To run a consistency-checker and detect inconsistent states of software entries on the Layer 3 multicast forwarding tables, run the **show consistency-checker mcast l3m** command in privileged EXEC mode.

```
show consistency-checker mcast l3m start { all | vrf vrf-name { ipv4-address | ipv6-address } }
[ { recursive } ]
```

| Syntax Description | | |
|---|--|--|
| start | | Starts the consistency-checker for Layer 3 multicast. <ul style="list-style-type: none"> • all : Starts the checker for entire table • vrf vrf-name { ipv4-address ipv6-address }: Starts the checker for the specified VRF. |
| all | | Starts the checker for entire table. |
| vrf vrf-name { ipv4-address ipv6-address } | | Starts the checker for the specified VRF. |
| recursive | | Runs a recursive consistency-checker. |

Command Default No default behavior or values.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Cupertino 17.7.1 | This command was introduced. |

Usage Guidelines The consistency checker has the following limitations:

- There is no command to abort or terminate the consistency checker. It will stop only once the full report has been displayed.
- FED hardware checks are partially implemented. Only errors in programming hardware will be reported.
- False Positive cases: When the consistency checker is running and a large number of feature table entry delete/add/modify actions occur (triggered via clear * or relearn), the consistency checker may report inconsistent or missing entries across processes. It can also switch off the stale reporting due to a large number of changes in table entries.

You can run an end to end consistency checker using the **show diagnostic content switch all** command for Layer 2 multicast and Layer 3 multicast.

Example

The following is a sample output for the **show consistency-checker mcast l3m start all** command:

```

Device# show consistency-checker mcast l3m start all
L3 multicast Full scan started. Run_id: 1
Use 'show consistency-checker run-id 1 status' for completion status.

This gives the status of consistency check for multicast

show consistency-checker objects

To run a consistency-checker and detect inconsistent states of software entries on objects, run the **show consistency-checker objects** command in privileged EXEC mode.

```
show consistency-checker objects { adjacency | interface | l2m_group | l2m_vlan | l3_entry | l3m_entry } [{ run-id }][{ detail }]
```

Syntax Description

| | |
|------------------|---|
| adjacency | Runs the consistenc-checker on adjacency entries. |
| interface | Runs the consistenc-checker on interface entries. |
| l2m_group | Runs the consistenc-checker on Layer 2 Multicast group entries. |
| l2m_vlan | Runs the consistenc-checker on Layer 2 Multicast VLAN entries. |
| l3_entry | Runs the consistenc-checker on Layer 3 Unicast entries. |
| l3m_entry | Runs the consistenc-checker on Layer 3 Multicast entries. |
| <i>run-id</i> | Runs the consistency-checker by run ID. |
| detail | Displays detailed output for the run ID. |

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Bengaluru 17.6.1 | This command was introduced. |

Usage Guidelines

The consistency checker has the following limitations:

- There is no command to abort or terminate the consistency checker. It will stop only once the full report has been displayed.
- FED hardware checks are partially implemented. Only errors in programming hardware will be reported.
- False Positive cases: When the consistency checker is running and a large number of feature table entry delete/add/modify actions occur (triggered via clear * or relearn), the consistency checker may report inconsistent or missing entries across processes. It can also switch off the stale reporting due to a large number of changes in table entries.

Example

The following is sample output for the **show consistency-checker objects l2m_group** command:

```
Device# show consistency-checker objects l2m_group
Process: IOSD
```

| Run-id | Start-time | Exception |
|--------|---------------------|-----------|
| 1 | 2021/02/17 05:20:42 | 0 |
| 2 | 2021/02/17 06:19:05 | 0 |

Process: FMAN-FP

*Statistics(A/I/M/S/Oth): Actual/Inherited/Missing/Stale/Others

| Run-id | Start-time | State | A/ | I/ | M/ | S/Oth |
|--------|---------------------|------------|----|----|----|-------|
| 1 | 2021/02/17 05:20:42 | Consistent | 0/ | 0/ | 0/ | 0/ 0 |
| 2 | 2021/02/17 06:19:05 | Consistent | 0/ | 0/ | 0/ | 0/ 0 |

Device#

show consistency-checker run-id

To run a consistency-checker and detect inconsistent states of software entries by run ID, run the **show consistency-checker run-id** *run-id* command in privileged EXEC mode.

show consistency-checker run-id *run-id* [{ **detail** | **status** }]

| Syntax Description | |
|--------------------|--|
| run-id | Specifies the run ID. |
| detail | Displays detailed output for the run ID. |
| status | Displays the completion status of the checker. |

Command Default No default behavior or values.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Bengaluru 17.6.1 | This command was introduced. |

Usage Guidelines The consistency checker has the following limitations:

- There is no command to abort or terminate the consistency checker. It will stop only once the full report has been displayed.
- FED hardware checks are partially implemented. Only errors in programming hardware will be reported.
- False Positive cases: When the consistency checker is running and a large number of feature table entry delete/add/modify actions occur (triggered via clear * or relearn), the consistency checker may report inconsistent or missing entries across processes. It can also switch off the stale reporting due to a large number of changes in table entries.

Example

The following is sample output for the **show consistency-checker run-id** *run-id* command:

```
Device# show consistency-checker run-id 6
Process: IOSD
Flags:    F - Full Table Scan, S - Single Entry Run
          RE - Recursive Check, GD - Garbage Detector
          Hw - Hardware Check, HS - Hardware Shadow Copy
Object-Type  Start-time          Entries  Exceptions  Flags
l2m_vlan    2021/07/19 15:19:41      30       0      F Hw HS
l2m_group   2021/07/19 15:19:42      10       0      F Hw HS

Process: FMAN-FP
*Statistics (A/I/M/S/Oth): Actual/Inherited/Missing/Stale/Others

```

Device#

The following is sample output for the **show consistency-checker run-id run-id status** command:

```

Device# show consistency-checker run-id 6 status
Process: IOSD
  Object-Type   Status           Time (sec)   Exceptions
  l2m_vlan     Completed        13           No
  l2m_group    Completed        13           No

Process: FMAN-FP
  Object-Type   Status           Time (sec)   State
  l2m_vlan     Completed        12           Consistent
  l2m_group    Completed        11           Consistent

Process: FED
  Object-Type   Status           Time (sec)   State
  l2m_vlan     Completed        12           Consistent
  l2m_group    Completed        11           Consistent

Device#

```

show debug

To display all the debug commands available on a switch, use the **show debug** command in Privileged EXEC mode.

show debug

show debug condition *Condition identifier* | *All conditions*

| | |
|---------------------------|---|
| Syntax Description | <i>Condition identifier</i> Sets the value of the condition identifier to be used. Range is between 1 and 1000. |
| | <i>All conditions</i> Shows all conditional debugging options available. |

Command Default No default behavior or values.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|------------------------|---------------------------|------------------------------|
| | Cisco IOS XE Release 16.1 | This command was introduced. |

Usage Guidelines Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

Examples This example shows the output of a **show debug** command:

```
Device# show debug condition all
```

To disable debugging, use the **no debug all** command.

show env

To display the list of sensors and all details like location, operational counters, status, history and so on, for the sensors, use the **show env** command in EXEC modes.

```
show env { all | counters | history sensor-name | location sensor-name | sensor sensor-name
| status | summary | table sensor-name }
```

| Syntax Description | |
|-----------------------------------|---|
| all | Displays a list of sensors on the switch. |
| counters | Displays the operational counters. |
| history <i>sensor-name</i> | Displays the sensor state change history. |
| location | Displays sensors by location. |
| sensor <i>sensor-name</i> | Displays sensor summary. |
| status | Displays the environmental status of the power fan units (PFU). |
| summary | Displays a summary of all environmental monitoring sensors. |
| table <i>sensor-name</i> | Displays sensor state table. |

Command Default No default behavior or values.

Command Modes User EXEC
Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Use the **show env** privileged EXEC command to display the device sensor information.

The following example shows how to display information for a sensor:

```
Switch#show env sensor Temp
Sensor Summary: Environmental Monitoring
Sensor: Temp: Coretemp      Location: R0
Current State: Normal      Reading: 46 Celsius

Sensor: Temp: DopplerD     Location: R0
Current State: Normal      Reading: 86 Celsius

Sensor: Temp: outlet      Location: R0
Current State: Normal      Reading: 43 Celsius

Sensor: Temp: inlet       Location: R0
Current State: Normal      Reading: 43 Celsius
```

```

Sensor: Temp:   Outlet   Location: 6/0
Current State: Normal           Reading: 39 Celsius

Sensor: Temp:   Inlet    Location: 6/0
Current State: Normal           Reading: 36 Celsius

Sensor: Temp:   Outlet   Location: 5/0
Current State: Normal           Reading: 33 Celsius

Sensor: Temp:   Inlet    Location: 5/0
Current State: Normal           Reading: 28 Celsius

```

The following example shows how to display the status of different sensors:

```

Switch#show env status
Power
Supply  Model No                Type  Capacity  Status        Fan States
-----  -----
PS2     WS-XP3200AC                AC    3200 W    active        good  good  good  good
PS3     WS-XP3200AC                AC    3200 W    active        good  good  good  good

PS Current Configuration Mode : Combined
PS Current Operating State    : Combined

Power supplies currently active   : 2
Power supplies currently available : 2

Fantray : good
Power consumed by Fantray : 350 Watts
Fantray airflow direction : side-to-side
Fantray beacon LED: off
Fantray status LED: green
SYSTEM : GREEN

```

The following example shows how to display the sensor state table:

```

Switch#show env table Temp
Sensor State Table: Environmental Monitoring
Sensor: Temp: Coretemp   Location: R0
Current State: Normal           Reading: 46 Celsius

show env xps

To display budgeting, configuration, power, and system power information for the Cisco eXpandable Power System (XPS) 2200, use the **show env xps** command in privileged EXEC mode.

```
show env xps { budgeting | configuration | port [ all | number ] | power | system |
thermal | upgrade | version }
```

| Syntax Description | | |
|-----------------------------|--|---|
| budgeting | | Displays XPS power budgeting, the allocated and budgeted power of all switches in the power stack. |
| configuration | | Displays the configuration resulting from the power xps privileged EXEC commands. The XPS configuration is stored in the XPS. Enter the show env xps configuration command to retrieve the non-default configuration. |
| port [all number] | | Displays the configuration and status of all ports or the specified XPS port. Port numbers are from 1 to 9. |
| power | | Displays the status of the XPS power supplies. |
| system | | Displays the XPS system status. |
| thermal | | Displays the XPS thermal status. |
| upgrade | | Displays the XPS upgrade status. |
| version | | Displays the XPS version details. |

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-------------|------------------------------|
| | 12.2(55)SE1 | This command was introduced. |

Usage Guidelines Use the **show env xps** privileged EXEC command to display the information for XPS 2200.

Examples

This is an example of output from the show env xps budgeting command:

```
Switch#
=====

XPS 0101.0100.0000 :

Table 206: Related Commands

| Command | Description |
|---|--------------------------------------|
| power xps(global configuration command) | Configures XPS and XPS port names. |
| power xps(privileged EXEC command) | Configures the XPS ports and system. |

show flow monitor

To display the status and statistics for a flow monitor, use the **show flow monitor** command in privileged EXEC mode.

| Syntax Description | name | (Optional) Specifies the name of a flow monitor. |
|--------------------|---------------------|--|
| | <i>monitor-name</i> | (Optional) Name of a flow monitor that was previously configured. |
| | cache | (Optional) Displays the contents of the cache for the flow monitor. |
| | format | (Optional) Specifies the use of one of the format options for formatting the display output. |
| | csv | (Optional) Displays the flow monitor cache contents in comma-separated variables (CSV) format. |
| | record | (Optional) Displays the flow monitor cache contents in record format. |
| | table | (Optional) Displays the flow monitor cache contents in table format. |
| | statistics | (Optional) Displays the statistics for the flow monitor. |

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **cache** keyword uses the record format by default.

The uppercase field names in the display output of the **show flowmonitor** *monitor-name* **cache** command are key fields that uses to differentiate flows. The lowercase field names in the display output of the **show flow monitor** *monitor-name* **cache** command are nonkey fields from which collects values as additional data for the cache.

Examples

The following example displays the status for a flow monitor:

```
# show flow monitor FLOW-MONITOR-1

Flow Monitor FLOW-MONITOR-1:
  Description:      Used for basic traffic analysis
  Flow Record:     flow-record-1
  Flow Exporter:   flow-exporter-1
                  flow-exporter-2

  Cache:
    Type:           normal
    Status:         allocated
    Size:           4096 entries / 311316 bytes
    Inactive Timeout: 15 secs
    Active Timeout: 1800 secs
```

This table describes the significant fields shown in the display.

Table 207: show flow monitor monitor-name Field Descriptions

| Field | Description |
|------------------|---|
| Flow Monitor | Name of the flow monitor that you configured. |
| Description | Description that you configured or the monitor, or the default description User defined. |
| Flow Record | Flow record assigned to the flow monitor. |
| Flow Exporter | Exporters that are assigned to the flow monitor. |
| Cache | Information about the cache for the flow monitor. |
| Type | Flow monitor cache type. The value is always normal, as it is the only supported cache type. |
| Status | Status of the flow monitor cache. The possible values are: <ul style="list-style-type: none"> • allocated—The cache is allocated. • being deleted—The cache is being deleted. • not allocated—The cache is not allocated. |
| Size | Current cache size. |
| Inactive Timeout | Current value for the inactive timeout in seconds. |
| Active Timeout | Current value for the active timeout in seconds. |

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1:

This table describes the significant fields shown in the display.

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1 in a table format:

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-IPv6 (the cache contains IPv6 data) in record format:

The following example displays the status and statistics for a flow monitor:

show idprom module

To display the identification programmable read-only memory (IDPROM) information for a specific module, use the **show idprom module** command in privileged EXEC mode.

show idprom module *slot-number* **eeeprom** [**detail** | **dump**]

| Syntax Description | | |
|--------------------|-----------------------------|---|
| <i>slot-number</i> | | Specifies the slot number. |
| eeeprom | | Specifies EEPROM information. |
| detail | | (Optional) Specifies detailed EEPROM information. |
| dump | | (Optional) Specifies EEPROM information in hexadecimal or ASCII format. |
| Command Modes | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

The following is sample output from the **show idprom module** command:

```
Device# show idprom module 1 eeeprom detail

show install

To display information about install packages, use the **show install** command in privileged EXEC mode.

show install {**active** | **committed** | **inactive** | **log** | **package** {**bootflash:** | **flash:** | **webui:**} | **rollback** | **summary** | **uncommitted**}

| Syntax Description | | |
|--|--|--|
| active | | Displays information about active packages. |
| committed | | Displays package activations that are persistent. |
| inactive | | Displays inactive packages. |
| log | | Displays entries stored in the logging installation buffer. |
| package | | Displays metadata information about the package, including description, restart information, components in the package, and so on. |
| { bootflash: flash: harddisk: webui: } | | Specifies the location of the install package. |
| rollback | | Displays the software set associated with a saved installation. |
| summary | | Displays information about the list of active, inactive, committed, and superseded packages. |
| uncommitted | | Displays package activations that are nonpersistent. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.3 | This command was introduced. |

Usage Guidelines Use the show commands to view the status of the install package.

Example

The following is sample output from the **show install package** command:

```
Device# show install package bootflash:cat3k-universalk9.2017-01-10_13.15.1.
CSCxxx.SSA.dmp.bin
Name: cat3k-universalk9.2017-01-10_13.15.1.CSCxxx.SS
Version: 16.6.1.0.199.1484082952..Everest
Platform: Catalyst3k
Package Type: dmp
Defect ID: CSCxxx
Package State: Added
Supersedes List: {}
Smu ID: 1
```

The following is sample output from the **show install summary** command:

```
Device# show install summary

Active Packages:
  bootflash:cat3k-universalk9.2017-01-10_13.15.1.CSCxxx.SSA.dmp.bin
Inactive Packages:
  No packages
Committed Packages:
  bootflash:cat3k-universalk9.2017-01-10_13.15.1.CSCxxx.SSA.dmp.bin
Uncommitted Packages:
  No packages
Device#
```

The table below lists the significant fields shown in the display.

Table 208: show install summary Field Descriptions

| Field | Description |
|----------------------|--|
| Active Packages | Name of the active install package. |
| Inactive Packages | List of inactive packages. |
| Committed Packages | Install packages that have saved or committed changes to the harddisk, so that the changes become persistent across reloads. |
| Uncommitted Packages | Intall package activations that are nonpersistent. |

The following is sample output from the **show install log** command:

```
Device# show install log

Related Commands

| Command | Description |
|----------------|------------------------|
| install | Installs SMU packages. |

show license all

To display all licensing information enter the **show license all** command in privileged EXEC mode. This command displays status, authorization, UDI, and usage information, all combined.

show license all

Syntax Description This command has no arguments or keywords.

Command Default Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|--|
| | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| | Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to display information relating to Smart Licensing Using Policy. Command output no longer displays Smart Account and Virtual account information. |
| | Cisco IOS XE Cupertino 17.7.1 | The output of the command was enhanced to display the following information: <ul style="list-style-type: none"> • RUM report statistics, in section <code>Usage Report Summary</code>. • Smart Account and Virtual Account information, in section <code>Account Information</code>. |

Usage Guidelines This command concatenates the output of other show license commands, enabling you to display different kinds of licensing information together. For field descriptions, refer to the corresponding commands.

Smart Licensing: If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing (whether smart licensing is enabled, all associated licensing certificates, compliance status, and so on).

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

- The `Smart Licensing Status` section corresponds with the output of the **show license status** command.
- The `License Usage` section corresponds with the output of the **show license usage** command.
- The `Product Information` section corresponds with the output of the **show license udi** command.
- The `Agent Version` section of the show license all command displays the Smart Agent version and is available only in this command.
- The `License Authorizations` section corresponds with the output of the **show license authorization** command.
- The `Usage Report Summary` section corresponds with the output in the **show license tech** command.

Examples

- [show license all for Smart Licensing Using Policy \(Cisco Catalyst 9300 Series Switches\)](#), on page 2123
- [show license all for Smart Licensing Using Policy \(Cisco Catalyst 9500 Series Switches\)](#), on page 2125
- [show license all for Smart Licensing](#), on page 2127

show license all for Smart Licensing Using Policy (Cisco Catalyst 9300 Series Switches)

The following is sample output of the **show license all** command in a stacking set-up. All the product instances in the stack are C9300X switches, which support the Export Control Key for High Security (HSECK9) starting from Cisco IOS XE Bengaluru 17.6.2. An HSECK9 key is used here and the requisite Smart Licensing Authorization Code (SLAC) is installed (SMART AUTHORIZATION INSTALLED on Oct 29 17:45:28 2021 UTC).

```

Related Commands

| Command | Description |
|-----------------------------------|--|
| show license status | Displays compliance status of a license. |
| show license authorization | Displays authorization code-related information. |
| show license summary | Displays summary of all active licenses. |
| show license udi | Displays UDI. |
| show license usage | Displays license usage information |
| show license tech support | Displays the debug output. |

show license authorization

To display authorization-related information for (export-controlled and enforced) licenses, enter the **show license authorization** command in privileged EXEC mode.

show license authorization

This command has no arguments or keywords.

Command Modes Privileged EXEC (Device#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.2a | This command was introduced. |

Usage Guidelines Use this command to display information about authorization codes. This includes SLR authorization codes and Smart Licensing Authorization Codes (SLAC).

Examples

For information about fields shown in the display, see [Table 209: show license authorization Field Descriptions, on page 2131](#).

For sample outputs, see:

- [Displaying SLAC, on page 2133](#)
- [Displaying SLR Authorization Code, on page 2133.](#)

Table 209: show license authorization Field Descriptions

| Field | Description |
|---------------------|--|
| Overall Status | <p>Header for UDI information for all product instances in the set-up, the type of authorization that is installed, and configuration errors, if any.</p> <p>In a High Availability set-up, all UDIs in the set-up are listed.</p> |
| Active: Status: | <p>The active product instance UDI, followed by the status of the authorization code installation for this UDI.</p> <p>If the status indicates that the authorization code is installed and there is a confirmation code, this is also displayed.</p> |
| Standby: Status: | <p>The standby product instance UDI, followed by the status of the authorization code installation for this UDI.</p> <p>If the status indicates that the authorization code is installed and there is a confirmation code, this is also displayed.</p> |
| Member: Status: | <p>The member product instance UDI, followed by the status of the authorization code installation for this UDI.</p> <p>If the status indicates that the authorization code is installed and there is a confirmation code, this is also displayed.</p> |
| ERROR: | <p>Configuration errors or discrepancies in the High Availability set-up, if any.</p> |

| Field | Description |
|------------------------|---|
| Authorizations | <p>Header for detailed license authorization information. All licenses, their enforcement types, and validity durations are displayed. Errors are displayed for each product instance if its authorization or mode does not match what is installed on the active.</p> <p>This section is displayed only if the product instance is using a license with an authorization code.</p> |
| (): | License name and a shortened form of the license name. |
| Description | License description. |
| Total available count: | <p>Total count of licenses that are <i>available</i> to consume.</p> <p>This includes licenses of all durations (perpetual and subscription), including expired subscription licenses, for all the product instances in a High Availability setup.</p> |
| Enforcement type | <p>Enforcement type for the license. This may be one of the following:</p> <ul style="list-style-type: none"> • Enforced • Not enforced • Export-Controlled |
| Term information: | <p>Header providing license duration information. The following fields maybe included under this header:</p> <ul style="list-style-type: none"> • Active: The active product instance UDI, followed by the status of the authorization code installation for this UDI. • Authorization type: Type of authorization code installed and date of installation. The type can be: SLAC, UNIVERSAL, SPECIFIED, PAK, RTU. • Start Date: Displays validity start date if the license is for a specific term or time period. • Start Date: Displays validity end date if the license is for a specific term or time period. • Term Count: License count. • Subscription ID: Displays ID if the license is for a specific term or time period. • License type: License duration. This can be: SUBSCRIPTION or PERPETUAL. • Standby: The standby product instance UDI, followed by the status of the authorization code installation for this UDI. • Member: The member product instance UDI, followed by the status of the authorization code installation for this UDI. |

| Field | Description |
|--------------------|---|
| Purchased Licenses | Header for license purchase information. |
| Active: | The active product instance and its the UDI. |
| Count: | License count. |
| Description: | License description. |
| License type: | License duration. This can be: SUBSCRIPTION or PERPETUAL. |
| Standby: | The standby product instance UDI. |
| Member: | The member product instance UDI. |

Displaying SLAC

The following is sample output of the **show license authorization** command on a C9300X model switch. Here SLAC is installed only on the active product instance in a stacking set-up:

```
Device# show license authorization
Overall status:
  Active: PID:C9300X-24HX,SN:FOC2519L8R7
           Status: SMART AUTHORIZATION INSTALLED on Oct 29 17:45:28 2021 UTC
           Last Confirmation code: 6746c5b5
  Standby: PID:C9300X-48HXN,SN:FOC2524L39P
           Status: NOT INSTALLED
  Member: PID:C9300X-48HX,SN:FOC2516LC92
           Status: NOT INSTALLED

Authorizations:
  C9K HSEC (Cat9K HSEC):
    Description: HSEC Key for Export Compliance on Cat9K Series Switches
    Total available count: 1
    Enforcement type: EXPORT RESTRICTED

```

show license data conversion

To display license data conversion information, enter the **show license data** command in privileged EXEC mode.

show license data conversion

Syntax Description

This command has no keywords or arguments

Command Modes

Privileged EXEC (Device#)

Command History

| Release | Modification |
|--------------------------------|---|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to display information relating to Smart Licensing Using Policy. Command output no longer displays Smart Account and Virtual account information. |

Usage Guidelines

Smart Licensing: If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

Device-led conversion is not supported on Cisco Catalyst Access, Core, and Aggregation Switches.

show license eventlog

To display event logs relating to Smart Licensing Using Policy, enter the **show license eventlog** command in privileged EXEC mode.

show license eventlog [*days*]

| | | |
|---------------------------|---|---|
| Syntax Description | <i>days</i> Enter the number of days for which you want to display event logs. The valid value range is from 0 to 2147483647. | |
| Command Modes | Privileged EXEC (Device#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| | Cisco IOS XE Amsterdam 17.3.2a | Additional events were added with the introduction of Smart Licensing Using Policy: <ul style="list-style-type: none"> • Installation and removal of a policy • Request, installation and removal of an authorization code. • Installation and removal of a trust code. • Addition of authorization source information for license usage. |

Usage Guidelines

Smart Licensing: If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

Examples

[show license eventlog for One Day, for Smart Licensing Using Policy, on page 2136](#)

[show license eventlog for All Events, for Smart Licensing Using Policy, on page 2137](#)

show license eventlog for One Day, for Smart Licensing Using Policy

The following is sample output from the **show license eventlog** command on a Cisco Catalyst 9500 switch. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches. The command is configured to display events for one day.

```
Device# show license eventlog 1

show license history message

To display communication history between the product instance and CSSM or CSLU (as the case may be), enter the **show license history message** command in privileged EXEC mode. The output of this command is used by the technical support team, for troubleshooting.

show license history message

Syntax Description

This command has no keywords or arguments.

Command Modes

Privileged EXEC (Device#)

Command History

| Release | Modification |
|--------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.2a | This command was introduced. |

Usage Guidelines

When you encounter an error message that you are not able to resolve, along with a copy of the message that appears on the console or in the system log, provide your Cisco technical support representative with sample output of these commands: **show license tech support**, **show license history message**, and the **show platform software sl-infra all** privileged EXEC commands.

show license reservation

To display license reservation information, enter the **show license reservation** command in privileged EXEC mode.

show license reservation

This command has no arguments or keywords.

Command Modes

Privileged EXEC (Device#)

Command History

| Release | Modification |
|--------------------------------|---|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| Cisco IOS XE Amsterdam 17.3.2a | The command continues to be available on the CLI, but is no longer applicable because the notion of reservation does not exist in the Smart Licensing Using Policy environment. |

Usage Guidelines

The command continues to be available on the CLI and corresponding output is displayed, but with the introduction of Smart Licensing Using Policy, the notion of reservation is no longer applicable. Use the **show license all** command in privileged EXEC mode, to display *migrated* SLR licenses instead (the SLR authorization code is migrated to Smart Licensing Using Policy).

show license rum

To display information about Resource Utilization Measurement reports (RUM report) available on the product instance, including report IDs, the current processing state of a report, error information (if any), and to save the detailed or summarized view that is displayed, enter the **show license rum** command in privileged EXEC mode.

```
show license rum { feature { license_name | all } | id { rum_id | all } } [ detail ] [ save path ]
```

Syntax Description

| | |
|---|---|
| feature { <i>license_name</i> all } | Displays RUM report information based on the license name. Specify a particular license name to display all RUM reports for that license, or use the all keyword to display all RUM reports available on the product instance. |
| id { <i>rum_id</i> all } | Displays RUM report information based on the RUM report ID. Specify a report ID to display information for a single report, or use the all keyword to display all RUM reports available on the product instance. |
| detail | Displays detailed RUM report information. You can use this to display detailed information by license name and detailed information by RUM report ID. |
| save path | Saves the information that is displayed. This can be the simplified or detailed version and depends on the preceding keywords you have entered. Information about 200 RUM reports can be displayed. If there are more 200 RUM reports on the product instance, you can view information about all the RUM reports by saving it to a text (.txt) file. Note This option saves the information <i>about</i> RUM reports and is not for reporting purposes. It does not save the RUM report, which is an XML file containing usage information. |

Command Modes

Privileged EXEC (Device#)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Cupertino 17.7.1 | This command was introduced. |

Usage Guidelines

A RUM report is a license usage report, which the product instance generates, to fulfil reporting requirements as specified by the policy. An acknowledgement (ACK) is a response from CSSM and provides information about the status of a RUM report. Once the ACK for a report is available on the product instance, it indicates

that the corresponding RUM report is no longer required and can be deleted. You can use the **show license rum** command to:

- Display information about the available RUM reports on the product instance - filtered by ID or license name.
- Display a short summary of the information or display a detailed view of the information.
- Track a RUM report throughout its lifecycle (from the time it is first generated until its acknowledgement from CSSM). By displaying the current processing state and condition of a report you can ascertain if and when there is a problem in the reporting workflow.
- Save the displayed information. The CLI displays information about up to 200 reports. If there are more than 200 reports on the product instance and you want to view information about all of them, save the displayed info in a .txt file and export to the desired location to view.

To display a statistical view of RUM report information (the total number of reports on the product instance, the number of reports that have a corresponding ACK, the number of reports waiting for an ACK etc.) refer to the `Usage Report Summary`: section of the **show license all** and **show license tech** privileged EXEC commands.

The **show license tech** command also provides RUM report related information that the Cisco technical support team can use to troubleshoot, if there are problems with RUM reporting.

Examples

For information about fields shown in the display, see [Table 210: show license rum \(simplified view\) Field Descriptions, on page 2141](#) and [Table 211: show license rum \(detailed view\) Field Descriptions, on page 2143](#)

For examples of the **show license rum** command, see:

- [show license rum feature: Simplified and Detailed View, on page 2144](#)
- [Saving RUM Report View, on page 2147](#)

Table 210: show license rum (simplified view) Field Descriptions

| Field Name | Description |
|------------|---|
| Report Id | A numeric field that identifies a RUM report. The product instance automatically assigns an ID to every RUM report it generates. An ID may be up to 20 characters long. |

| Field Name | Description |
|--------------|---|
| State | <p>This field displays the current processing state of a RUM report, and can be only one of the following:</p> <ul style="list-style-type: none"> • OPEN: This means new measurements are being added to this report. • CLOSED: This means no further measurements can be added to this report, and the report is ready for communication to CSSM. • PENDING: This is a transitional status that you may see if you display a report while it is being transmitted. • UNACK: This means the report was transmitted and is waiting for confirmation from CSSM, that it is processed. • ACK: This means the report was processed or acknowledged by CSSM and is eligible for deletion. |
| Flag | <p>Indicates the condition of the RUM report, and is displayed in the form of a character. Each character represents a specific condition, and can be only one of the following values:</p> <ul style="list-style-type: none"> • N: Normal; This means no errors have been detected and the report is going through normal operation. • P: Purged; This means the report was removed due to system resource limitation, and can refer to a shortage of disk space or insufficient memory. If this flag is displayed, refer to the <code>State Change Reason</code> field in the detailed view for more information. • E: Error; This means an error was detected in the RUM report. If this flag is displayed, refer to the detailed view for more information. Possible workflow issues include and are not limited to the following: <ul style="list-style-type: none"> • RUM report was dropped by CSSM. If this is the issue, the <code>State</code> field displays value <code>ACK</code>, but the <code>State Change Reason</code> does not change to <code>ACKED</code>. • RUM Report data is missing. If this is the issue, the <code>Storage State</code> field displays value <code>MISSING</code>. • Tracking information is missing. If this is the case the <code>State</code> field displays value <code>UNACK</code> and the <code>Transaction ID</code> field has no information. <p>Note Occasional errors in RUM reports do not require any action from you and are not an indication of a problem. It is only if you see a large number of reports (greater than 10) with errors that you must contact the Cisco technical support team.</p> |
| Feature Name | The name of the license that the RUM report applies to. |

Table 211: show license rum (detailed view) Field Descriptions

| Field Name | Description |
|----------------------|--|
| Report Id | A numeric field that identifies a RUM report. The product instance automatically assigns an ID to every RUM report it generates. An ID may be up to 20 characters long. |
| Metric Name: | Shows the type of data that is recorded. For a RUM report, the only possible value is ENTITLEMENT, and refers to measurement of license usage. |
| Feature Name: | The name of the license that the RUM report applies to. |
| Metric Value | A unique identifier for the data that is recorded. This is the same as the “Entitlement Tag” in the output of the show license tech commad and it displays information about the license being tracked. |
| UDI | Composed of the Product ID (PID) and serial number of the product instance. |
| Previous Report Id: | ID of the previous RUM report that the product instance generated for a license. |
| Next Report Id: | The ID that the product instance will use for the next RUM report it generates for a llicense. |
| State: | Displays the current processing state of a RUM report. The value displayed here is always the same as the value displayed in the simplified view. For the list of possible values see Table 210: show license rum (simplified view) Field Descriptions, on page 2141 above. |
| State Change Reason: | Displays the reason for a RUM report state change. Not all state changes provide a reason. <ul style="list-style-type: none"> • NONE: This means the RUM report is going through its normal lifecycle (for instance, from OPEN → CLOSED → ACK). This state change reason is usually accompanied by an N flag (meaning Normal) in the simplified view and requires no action from you. • ACKED: RUM report was processed normally by CSSM. • REMOVED: RUM report was received and requested to be removed by CSSM. • RELOAD: RUM report state was changed due to some type of device reload. • DECONFIG: License was removed from configuration. |
| Start Time: | Timestamps for measurement start and measurement end for a RUM report. |
| End Time: | Together, the start time and end time provide the time duration that the measurements cover. |

| Field Name | Description |
|----------------------|--|
| Storage State: | <p>Displays current storage state of the RUM report and can be one of the following values:</p> <ul style="list-style-type: none"> • EXIST: This means the data for the RUM report is located in storage. • DELETED: This means the data was intentionally deleted. Refer to the <code>Storage State Change Reason</code> in the output of the show license tech command for more information about this storage state. • PURGED: This means the data was deleted due to a system resource limitation. Refer to the <code>Storage State Change Reason</code> in the output of the show license tech command for more information about this storage state. • MISSING: This means data is missing from storage. If reports are identified as missing, there is no recovery process. |
| Transaction ID: | <p>Contains tracking information for the RUM report. This information can be either polling information or ACK import information.</p> <p>The Transaction Message contains the error message, if the product instance receives one when importing an ACK.</p> <p>The information in these fields is used by the Cisco technical support team when troubleshooting problems with RUM reports.</p> |
| Transaction Message: | |

show license rum feature: Simplified and Detailed View

The following is sample output of the **show license rum feature *license-name*** and **show license rum feature *license-name* detail** commands on a Cisco Catalyst 9500 Series Switch. Similar output is displayed on all other Catalyst switches.

The output is filtered to display all RUM reports for the DNA Advantage license, followed by a detailed view of all RUM reports for the DNA Advantage license.

Saving RUM Report View

The following example shows you how to save a simplified view of the **show license rum feature all** command.

By using the **feature** and **all** keywords, the output is filtered to display all RUM reports for all licenses being used on the product instance. You can then transfer it to a location from where you can open the text file and view the information.

```

Device# show license rum feature all save bootflash:all-rum-stats.txt
Device# copy bootflash:all-rum-stats.txt tftp://10.8.0.6/user01/

```

show license status

To display information about licensing settings such as data privacy, policy, transport, usage reporting and trust codes, enter the **show license status** command in privileged EXEC mode.

show license status

Syntax Description This command has no arguments or keywords.

Command Default Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|--|
| | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| | Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to reflect new fields that are applicable to Smart Licensing Using Policy. This includes <code>Trust code installed:</code> , <code>Policy in use</code> , <code>Policy name:</code> , reporting requirements as in the policy, and <code>Usage Reporting:</code> . Command output no longer displays Smart Account and Virtual account information. |
| | Cisco IOS XE Cupertino 17.7.1 | Command output was updated to display Smart Account and Virtual account information. |

Usage Guidelines **Smart Licensing:** If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

Account Information in the output

Starting with Cisco IOS XE Cupertino 17.7.1, every ACK includes the Smart Account and Virtual Account that was reported to, in CSSM. When it receives the ACK, the product instance securely stores only the latest version of this information - as determined by the timestamp in the ACK. The Smart Account and Virtual Account information that is displayed in the `Account Information` section of this command's output is therefore always as per the latest available ACK on the product instance.

If a product instance is moved from one Smart Account and Virtual Account to another, the next ACK after the move will have this updated information. The output of this command is updated once this ACK is available on the product instance.

The ACK may be received directly (where the product instance is connected to CSSM), or indirectly (where the product instance is connect to CSSM through CSLU, Cisco DNA Center, or SSM On-Prem), or by manually importing the ACK (where a product instance is in an air-gapped network).

Examples

For information about fields shown in the display, see [Table 212: show license status Field Descriptions for Smart Licensing Using Policy, on page 2149](#)

For sample outputs, see:

- [show license status for Smart Licensing Using Policy, on page 2154](#)
- [show license status for Smart Licensing, on page 2155](#)

Table 212: show license status Field Descriptions for Smart Licensing Using Policy

| Field | Description | |
|-------------------------------|--|---|
| Utility | Header for utility settings that are configured on the product instance. | |
| | Status: | Status |
| | Utility report: | Last attempt: |
| | Customer Information: | The following fields are displayed: <ul style="list-style-type: none"> • Id: • Name: • Street • City: • State: • Country: • Postal Code: |
| Smart Licensing Using Policy: | Header for policy settings on the product instance. | |
| | Status: | Indicates if Smart Licensing Using Policy is enabled. Smart Licensing Using Policy is supported starting from Cisco IOS XE Amsterdam 17.3.2 and is always enabled on supported software images. |
| Account Information: | Header for account information that the product instance belongs to, in CSSM. This section is displayed only if the software version on the product instance is Cisco IOS XE Cupertino 17.7.1 or a later release. If an ACK is not installed on the product instance, these fields display <none>. | |
| | Smart Account: | The Smart Account that the product instance is part of. This information is always as per the latest available ACK on the product instance. |
| | Virtual Account: | The Virtual Account that the product instance is part of. This information is always as per the latest available ACK on the product instance. |

| Field | Description |
|-----------------------------------|---|
| Data Privacy: | Header for privacy settings that are configured on the product instance. |
| Sending Hostname: | A <i>yes</i> or <i>no</i> value which shows if the hostname is sent in usage reports. |
| Callhome hostname privacy: | Indicates if the Call Home feature is configured as the mode of transport for reporting. If configured, one of these values is displayed: <ul style="list-style-type: none"> • ENABLED • DISABLED |
| Smart Licensing hostname privacy: | One of these values is displayed: <ul style="list-style-type: none"> • ENABLED • DISABLED |
| Version privacy: | One of these values is displayed: <ul style="list-style-type: none"> • ENABLED • DISABLED |
| Transport: | Header for transport settings that are configured on the product instance. |
| Type: | Mode of transport that is in use. Additional fields are displayed for certain transport modes. For example, if transport type is set to CSLU, the CSLU address is also displayed. |

| Field | Description |
|--|---|
| Policy: | Header for policy information that is applicable to the product instance. |
| Policy in use: | Policy that is applied This can be one of the following: Cisco default, Product default, Permanent License Reservation, Specific License Reservation, PAK license, Installed on <date>, Controller. |
| Policy name: | Name of the policy |
| Reporting ACK required: | A <i>yes</i> or <i>no</i> value which specifies if the report for this product instance requires CSSM acknowledgement (ACK) or not. The default policy is always set to “yes”. |
| Unenforced/Non-Export Perpetual Attributes | Displays policy values for perpetual licenses. <ul style="list-style-type: none"> • First report requirement (days): The maximum amount of time available before the first report must be sent, followed by policy name. • Reporting frequency (days): The maximum amount of time available before the subsequent report must be sent, followed by policy name. • Report on change (days): he maximum amount of time available to send a report in case of a change in license usage, followed by policy name |
| Unenforced/Non-Export Subscription Attributes | Displays policy values for subscription licenses. <ul style="list-style-type: none"> • First report requirement (days): The maximum amount of time available before the first report must be sent, followed by policy name. • Reporting frequency (days): The maximum amount of time available before the subsequent report must be sent, followed by policy name. • Report on change (days): he maximum amount of time available to send a report in case of a change in license usage, followed by policy name |
| Enforced (Perpetual/Subscription) License Attributes | |

| Field | | Description |
|---------------|--|--|
| | | <p>Displays policy values for enforced licenses.</p> <ul style="list-style-type: none"> • First report requirement (days): The maximum amount of time available before the first report must be sent, followed by policy name. • Reporting frequency (days): The maximum amount of time available before the subsequent report must be sent, followed by policy name. • Report on change (days): The maximum amount of time available to send a report in case of a change in license usage, followed by policy name |
| | Export (Perpetual/Subscription) License Attributes | <p>Displays policy values for export-controlled licenses.</p> <ul style="list-style-type: none"> • First report requirement (days): The maximum amount of time available before the first report must be sent, followed by policy name. • Reporting frequency (days): The maximum amount of time available before the subsequent report must be sent, followed by policy name. • Report on change (days): The maximum amount of time available to send a report in case of a change in license usage, followed by policy name |
| Miscellaneous | Header for custom ID. | |
| | Custom Id: | ID |

| Field | Description |
|-------------------------|--|
| Usage Reporting: | Header for usage reporting (RUM reports) information. |
| Last ACK received: | Date and time of last ACK received, in the local time zone. |
| Next ACK deadline: | Date and time for next ACK. If the policy states that an ACK is not required then this field displays <code>none</code> . Note If an ACK is required and is not received by this deadline, a syslog is displayed. |
| Reporting Interval: | Reporting interval in days The value displayed here depends on what you configure in the license smart usage interval <code>interval_in_days</code> and the policy value. For more information, see the corresponding Syntax Description: Table 212: show license status Field Descriptions for Smart Licensing Using Policy, on page 2149 . |
| Next ACK push check: | Date and time when the product instance will submit the next polling request for an ACK. Date and time are in the local time zone. This applies only to product instance- initiated communication to CSSM or CSLU. If the reporting interval is zero, or if no ACK polling is pending, then this field displays <code>none</code> . |
| Next report push: | Date and time when the product instance will send the next RUM report. Date and time are in the local time zone. If the reporting interval is zero, or if there are no pending RUM reports, then this field displays <code>none</code> . |
| Last report push: | Date and time for when the product instance sent the last RUM report. Date and time are in the local time zone. |
| Last report file write: | Date and time for when the product instance last saved an offline RUM report. Date and time are in the local time zone. |
| Last report pull: | Date and time for when usage reporting information was retrieved using data models. Date and time are in the local time zone. |

| Field | Description |
|--------------------------|--|
| Trust Code Installed: | Header for trust code-related information. Displays date and time if trust code is installed. Date and time are in the local time zone. If a trust code is not installed, then this field displays <i>none</i> . |
| Active: | Active product instance. In a High Availability set-up, the the UDIs of all product instances in the set-up, along with corresponding trust code installation dates and times are displayed. |
| Standby: | Standby product instance. |
| Member: | Member product instance |

show license status for Smart Licensing Using Policy

The following is sample output of the **show license status** command on a Cisco Catalyst 9500 switch where the software version running on the product instance is Cisco IOS XE Cupertino 17.7.1. Note the Smart Account and Virtual Account fields in the output starting from this release.

An ACK has not been installed on this product instance (Last ACK received: <none>). The account information fields therefore display <none>:

```

Related Commands

| Command | Description |
|-----------------------------------|--|
| show license all | Displays entitlements information. |
| show license authorization | Displays authorization code-related information. |
| show license summary | Displays summary of all active licenses. |
| show license udi | Displays UDI. |
| show license usage | Displays license usage information |
| show tech-support license | Displays the debug output. |

show license summary

To display a brief summary of license usage, which includes information about licenses being used, the count, and status, use the **show license summary** command in privileged EXEC mode.

show license summary

Syntax Description This command has no arguments or keywords.

Command Default Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|---|
| | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| | Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to reflect valid license status for Smart Licensing Using Policy. Valid license statuses are now only <code>IN USE</code> , <code>NOT IN USE</code> , <code>NOT AUTHORIZED</code> . Command output was also updated to remove registration and authorization information. Command output no longer displays Smart Account and Virtual account information. |
| | Cisco IOS XE Cupertino 17.7.1 | Command output was updated to display Smart Account and Virtual account information. |

Usage Guidelines

Smart Licensing: If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

License status

- The **unenforced licenses** that are available on Cisco Catalyst Access, Core, and Aggregation Switches are never `NOT AUTHORIZED` or `NOT IN USE`.
- The **export-controlled license**, Export Control Key for High Security (HSECK9 key), which is supported on the switches listed below, displays status `NOT IN USE` if an HSECK9 key is available on the product instance and the requisite Smart Licensing Authorization Code (SLAC) is installed, but the cryptographic feature that requires the HSECK9 key is not configured.
 - Cisco Catalyst 9300X Series Switches, from Cisco IOS XE Bengaluru 17.6.2
 - Cisco Catalyst 9600 Series 40-Port 50G, 2-Port 200G, 2-Port 400G Line Card (C9600-LC-40YL4CD) from Cisco IOS XE Cupertino 17.8.1
 - Cisco Catalyst 9500X Series Switches from Cisco IOS XE Cupertino 17.8.1

Configure the applicable cryptographic feature for the count and status fields to change to 1 and IN USE respectively.

For more detailed license usage information, see the output of the **show license usage** privileged EXEC command.

Usage Count

In a stacking setup, even if you install SLAC on more than one device, the usage count remains 1. This is because only one HSECK9 key is used at a given point in time - the one on the active. The license on the standby comes into effect when a switchover occurs. The count remains 1 with the new active as well, because it is still only one HSECK9 key that is being used.

In case of a modular chassis, the usage count must display only 1 because only one HSECK9 key is required for each chassis UDI - regardless of the number of supervisors installed.

Account information in the output

Starting with Cisco IOS XE Cupertino 17.7.1, every ACK includes the Smart Account and Virtual Account that was reported to, in CSSM. When it receives the ACK, the product instance securely stores only the latest version of this information - as determined by the timestamp in the ACK. The Smart Account and Virtual Account information that is displayed in the `Account Information` section of this command's output is therefore always as per the latest available ACK on the product instance.

If a product instance is moved from one Smart Account and Virtual Account to another, the next ACK after the move will have this updated information. The output of this command is updated once this ACK is available on the product instance.

The ACK may be received directly (where the product instance is connected to CSSM), or indirectly (where the product instance is connect to CSSM through CSLU, Cisco DNA Center, or SSM On-Prem), or by manually importing the ACK (where a product instance is in an air-gapped network).

Examples

For information about fields shown in the display, see [Table 213: show license summary Field Descriptions for Smart Licensing Using Policy, on page 2158](#)

For sample outputs, see:

- [show license summary \(Cisco Catalyst 9500 Series Switches\), on page 2159](#)
- [show license summary \(Cisco Catalyst 9300X Series Switches\), on page 2159](#)

Table 213: show license summary Field Descriptions for Smart Licensing Using Policy

| Field | Description |
|--|--|
| Account Information: Smart Account: Virtual Account: | The Smart Account and Virtual Account that the product instance is part of. This information is always as per the latest available ACK on the product instance. This field is displayed only if the software version on the product instance is Cisco IOS XE Cupertino 17.7.1 or a later release. If an ACK is not installed on the product instance, these fields display <code><none></code> . |
| License | Name of the licenses in use |
| Entitlement Tag | Short name for license |

| Field | Description |
|--------|---|
| Count | License count |
| Status | <p>License status can be one of the following</p> <ul style="list-style-type: none"> • In-Use: Valid license, and in-use. • Not In-Use: An HSECK9 key is available on the product instance and the requisite Smart Licensing Authorization Code (SLAC) is installed, but the cryptographic feature that requires the HSECK9 key is disabled or not configured. <p>This status is a prerequisite when you want to <i>return</i> the SLAC for an HSECK9 license to CSSM.</p> <ul style="list-style-type: none"> • Not Authorized: Means that the license requires installation of SLAC before use. |

show license summary (Cisco Catalyst 9500 Series Switches)

The following is sample output of the **show license summary** command, on a product instance where the software version is Cisco IOS XE Cupertino 17.7.1. Note the account information fields displayed from this release onwards:

```
Device# show license summary
```

```
Account Information:
  Smart Account: Eg-SA
  Virtual Account: Eg-VA
```

```
License Usage:
```

| License | Entitlement Tag | Count | Status |
|------------------------|-----------------|-------|--------|
| network-advantage_250M | (ESR_P_250M_A) | 1 | IN USE |
| dna-advantage_250M | (DNA_P_250M_A) | 1 | IN USE |

show license summary (Cisco Catalyst 9300X Series Switches)

The following are sample outputs of the **show license summary** command, on a C9300X stack.

The Status and Count columns here, display `NOT IN USE` and `0` for the HSECK9 key. This means the HSECK9 key is available and SLAC is installed, but the cryptographic feature that requires the license is not configured:

```
Device# show license summary
```

```
License Usage:
```

| License | Entitlement Tag | Count | Status |
|-------------------|-----------------------------|----------|-------------------|
| network-advantage | (C9300-24 Network Advan...) | 1 | IN USE |
| dna-advantage | (C9300-24 DNA Advantage) | 1 | IN USE |
| network-advantage | (C9300-48 Network Advan...) | 2 | IN USE |
| dna-advantage | (C9300-48 DNA Advantage) | 2 | IN USE |
| C9K HSEC | (Cat9K HSEC) | 0 | NOT IN USE |

The Status and Count columns here display `IN USE` and `1` for the HSECK9 key. This means the cryptographic feature, which requires an HSECK9 key, is configured.

```
Device# show license summary
```

```
License Usage:
```

| License | Entitlement Tag | Count | Status |
|-------------------|-----------------------------|----------|---------------|
| network-advantage | (C9300-24 Network Advan...) | 1 | IN USE |
| dna-advantage | (C9300-24 DNA Advantage) | 1 | IN USE |
| network-advantage | (C9300-48 Network Advan...) | 2 | IN USE |
| dna-advantage | (C9300-48 DNA Advantage) | 2 | IN USE |
| hseck9 | (Cat9K HSEC) | 1 | IN USE |

show license tech

To display licensing information to help the technical support team troubleshoot a problem, enter the **show license tech** command in privileged EXEC mode. The output for this command includes outputs of several other **show license** commands and more.

```
show license tech { message | rum { feature { license_name | all } | id { rum_id | all } } [ detail ] [ save_path ] | support }
```

| Syntax Description | | |
|--|--|--|
| message | | Displays messages concerning trust establishment, usage reporting, result polling, authorization code requests and returns, and trust synchronization. This is the same information as displayed in the output of the show license history message command. |
| rum { feature { license_name all } id { rum_id all } } [detail] [save_path] | | Displays information about Resource Utilization Measurement reports (RUM reports) on the product instance, including report IDs, the current processing state of a report, error information (if any), and an option save the displayed RUM report information. Note This option saves the information <i>about</i> RUM reports and is not for reporting purposes. It does not save the RUM report, which is an XML file containing usage information. |
| support | | Displays licensing information that helps the technical support team to debug a problem. |

Command Modes Privileged EXEC (Device#)

| Command History | Release | Modification |
|-----------------|--------------------------------|---|
| | Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| | Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to reflect new fields that are applicable to Smart Licensing Using Policy. |

| Release | Modification |
|-------------------------------|---|
| Cisco IOS XE Cupertino 17.7.1 | <p>The rum keyword and additional options under this keyword were added:</p> <pre>{ feature { license_name all } id { rum_id all } }</pre> <p>The output of the show license tech support command was enhanced to display the following information:</p> <ul style="list-style-type: none"> • RUM report information, in section <code>License Usage</code> and <code>Usage Report Summary</code>. • Smart Account and Virtual account information, in section <code>Account Information</code>. <p>The data conversion, eventlog and reservation keywords were removed from this command. They continue to be available as separate show commands, that is, show license data, show license eventlog, and show license reservation respectively.</p> |

Usage Guidelines

Smart Licensing: If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing (whether smart licensing is enabled, all associated licensing certificates, compliance status, and so on).

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

- Troubleshooting with a Support Representative

When you encounter an error message that you are not able to resolve, along with a copy of the message that appears on the console or in the system log, provide your Cisco technical support representative with sample output of these commands: **show license tech support**, **show license history message**, and the **show platform software sl-infra all** privileged EXEC commands.

- RUM Report Information in the output

- The output of the **show license tech support** command displays the following sections pertaining to RUM reports:

[Table 214: show license tech support: Field Descriptions for Header "License Usage", on page 2162](#)

```
License Usage

|----------------|--|
| Interval: | This is a fixed measurement duration and is always 15 minutes. |
| Current Value: | Information about the current license count. |

| Field Name | Description |
|-----------------|---|
| Current Report: | ID of the currently OPEN report for the license. |
| Previous: | ID of the last OPEN report for the license. This report will have state CLOSED now. |

Table 215: show license tech support: Field Descriptions for Header "Usage Report Summary", on page 2163

Usage Report Summary:

=====

Total: 26, Purged: 0(0)

Total Acknowledged Received: 0, Waiting for Ack: 0(26)

Available to Report: 26 Collecting Data: 2

Maximum Display: 26 In Storage: 26, MIA: 0(0)

Table 215: show license tech support: Field Descriptions for Header "Usage Report Summary"

| Field Name | Description |
|------------------------------|--|
| Total: | Total number of reports that the product instance has ever generated. Note This total does not refer to the total number of reports <i>currently available</i> on and being tracked by the product instance. For this you must sum up the <code>Total Acknowledged Received:</code> and <code>Available to Report</code> fields. |
| Purged: | The number of reports deleted due to a system resource limitation. This number includes RUM reports where the product instance no longer has tracking information. |
| Total Acknowledged Received: | The number of RUM reports acknowledged on this product instance. |
| Waiting for Ack: | The number of RUM reports waiting for an ACK. This is the total number of reports in an <code>UNACK</code> state, where the product instance still has tracking information. |
| Available to Report: | The number of RUM reports that are available to send to CSSM. This is the total number of reports in an <code>OPEN</code> or <code>CLOSED</code> state, where the product instance still has tracking information. |
| Collecting Data: | Number of reports where the product instance is currently collecting measurements. |
| Maximum Display: | Number of reports available for display in a <code>show</code> command's output. |
| In Storage: | Number of reports currently stored on the disk |
| MIA: | The number of reports missing. |

- The output of the **show license tech rum** command displays the following fields pertaining to RUM reports: [Table 216: show license tech rum: Field Descriptions for Header "Smart Licensing Usage Report Detail", on page 2164](#)

The options available under the **show license tech rum** keyword are the same as the options available with the **show license rum** privileged EXEC command. The sample output that is displayed in the *simplified view* is also the same. But if you use the **detail** keyword (for example if you enter **show license tech rum feature license_name detail**), the detailed view is displayed and this has a few *additional* fields when compared to **show license rum**.

Table 216: show license tech rum: Field Descriptions for Header "Smart Licensing Usage Report Detail"

| Field Name | Description |
|----------------|--|
| Version: | Displays the format of the report during transmission. Starting with Cisco IOS XE Cupertino 17.7.1, RUM reports are stored in a new format that reduces processing time. This field indicates if the product instance is using the old format or the new format. |
| Storage State: | Indicates if a given report is currently in storage. In addition to the displaying the current storage state of the RUM report, with these possible values: EXIST, DELETED, PURGED, MISSING, if a "(1)" is displayed next to the label (Storage State (1)), this means the RUM report is in the older (pre-17.7.1 format) and will be processed accordingly. If the RUM report is in the new format, the field is displayed as Storage State - without any extra information. |

| Field Name | Description |
|---|---|
| Storage State Change Reason: | <p>Displays the reason for the change in the storage state change. Not all state changes provide a reason.</p> <ul style="list-style-type: none"> • NONE: This means no reason was recorded for the the storage state change. • PROCESSED: This means the RUM report was deleted after CISCO has processed the data. • LIMIT_STORAGE: This means the RUM report was deleted because the product instance reached it's storage limit. • LIMIT_TIME: This means the RUM report was deleted because the report reached the persisted time limit. |
| Transaction ID: Transaction Message: | <p>If the transaction ID displays a correlation ID and an error status is displayed, the product instance displays the error code field in this section. If there are no errors, no data is displayed here.</p> |
| Report Size | <p>This field displays two numbers. The first number is the size of raw report for communication, in bytes. The second number is the disk space used for saving the report, also in bytes. The second number is displayed only if report is stored in the new format.</p> |

Examples

Example: show license tech support (Cisco Catalyst 9400 Series Switches)

The following is sample output from the **show license tech support** command on a Cisco Catalyst 9400 switch running software version Cisco IOS XE Cupertino 17.7.1. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches.

```
Device# show license tech support

show license udi

To display Unique Device Identifier (UDI) information for a product instance, enter the **show license udi** command in Privileged EXEC mode. In a High Availability set-up, the output displays UDI information for all connected product instances.

show license udi

Syntax Description

This command has no arguments or keywords.

Command Default

Privileged EXEC (#)

Command History

| Release | Modification |
|--------------------------------|---|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| Cisco IOS XE Amsterdam 17.3.2a | The command continues to be available and applicable in the Smart Licensing Using Policy environment. |

Usage Guidelines

Smart Licensing: If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

In a High Availability or stacking set-up, the output of the **show license udi** command displays the UDI information for all connected product instances.

Examples

[show licensing udi for Smart Licensing Using Policy, on page 2179](#)

[show license udi for Smart Licensing, on page 2179](#)

show licensing udi for Smart Licensing Using Policy

The following is sample output of the **show license udi** command for a High Availability set-up on a Catalyst 9500 switch. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches.

```
Device# show license udi

UDI: PID:C9500-16X,SN:FCW2233A5ZV
HA UDI List:
Active:PID:C9500-16X,SN:FCW2233A5ZV
Standby:PID:C9500-16X,SN:FCW2233A5ZY
```

show license udi for Smart Licensing

The following is sample output of the **show license udi** command:

```
Device# show license udi
UDI: PID:C9410R,SN:FXS2132Q0GU
```

```
HA UDI List:  
Active:PID:C9410R,SN:FXS2132Q0GU  
Standby:PID:C9410R,SN:FXS2132Q0GU
```

show license usage

To display license usage information such as status, a count of licenses being used, and enforcement type, enter the **show license usage** command in privileged EXEC mode.

show license usage

This command has no arguments or keywords.

Command Default

Privileged EXEC (#)

Command History

| Release | Modification |
|--------------------------------|--|
| Cisco IOS XE Fuji 16.9.1 | This command was introduced. |
| Cisco IOS XE Amsterdam 17.3.2a | Command output was updated to reflect new fields that are applicable to Smart Licensing Using Policy. This includes the <code>Status</code> , <code>Enforcement type</code> fields. Command output was also updated to remove reservation related information, authorization status information, and export status information. |

Usage Guidelines

Smart Licensing: If the software version on the device is Cisco IOS XE Amsterdam 17.3.1 or an earlier release, command output displays fields pertinent to Smart Licensing.

Smart Licensing Using Policy: If the software version on the device (also referred to as a product instance) is Cisco IOS XE Amsterdam 17.3.2a or a later release, command output displays fields pertinent to Smart Licensing Using Policy.

License status

- The **unenforced licenses** that are available on Cisco Catalyst Access, Core, and Aggregation Switches are `never NOT AUTHORIZED OR NOT IN USE`.
- The **export-controlled license**, Export Control Key for High Security (HSECK9 key), which is supported on the switches listed below, displays status `NOT IN USE` if an HSECK9 key is available on the product instance and the requisite Smart Licensing Authorization Code (SLAC) is installed, but the cryptographic feature that requires the HSECK9 key is not configured.
 - Cisco Catalyst 9300X Series Switches, from Cisco IOS XE Bengaluru 17.6.2
 - Cisco Catalyst 9600 Series 40-Port 50G, 2-Port 200G, 2-Port 400G Line Card (C9600-LC-40YL4CD) from Cisco IOS XE Cupertino 17.8.1
 - Cisco Catalyst 9500X Series Switches from Cisco IOS XE Cupertino 17.8.1

Configure the applicable cryptographic feature for the count and status fields to change to 1 and `IN USE` respectively.

Usage Count

In a stacking setup, even if you install SLAC on more than one device, the usage count remains 1. This is because only one HSECK9 key is used at a given point in time - the one on the active. The license on the

standby comes into effect when a switchover occurs. The count remains 1 with the new active as well, because it is still only one HSECK9 key that is being used.

In case of a modular chassis, the usage count must display only 1 because only one HSECK9 key is required for each chassis UDI - regardless of the number of supervisors installed.

Examples

See [Table 217: show license usage Field Descriptions for Smart Licensing Using Policy, on page 2182](#) for information about fields shown in the display.

[show license usage for Smart Licensing Using Policy, on page 2183](#)

[show license usage for Smart Licensing, on page 2183](#)

Table 217: show license usage Field Descriptions for Smart Licensing Using Policy

| Field | Description |
|-----------------------------------|---|
| License Authorization: Status: | Displays overall authorization status. |
| (): | Name of the license as in CSSM. If this license is one that requires an authorization code, the name of the license includes the code. |
| Description | Description of the license as in CSSM. |
| Count | License count. If the license is not in-use, the count is reflected as zero. |
| Version | Version. |
| Status | License status can be one of the following <ul style="list-style-type: none"> • In-Use: Valid license, and in-use. • Not In-Use: An HSECK9 key is available on the product instance and a Smart Licensing Authorization Code (SLAC) is installed, but the key that requires the HSECK9 key is disabled or not configured. This status is a prerequisite when you want to <i>return</i> the SLAC for use to CSSM. • Not Authorized: The license requires installation of a SLAC before use. |
| Export Status: | Indicates if the license is export-controlled or not. Accordingly, one of the following is displayed: <ul style="list-style-type: none"> • RESTRICTED - ALLOWED • RESTRICTED - NOT ALLOWED • NOT RESTRICTED |
| Feature name | Name of the feature that uses this license. |

| Field | Description |
|--------------------------|--|
| Feature Description: | Description of the feature that uses this license. |
| Utility Subscription id: | ID Not applicable, because the corresponding configuration option is not |
| Enforcement type | Enforcement type status for the license. This may be one of the following: <ul style="list-style-type: none"> • ENFORCED: A license, which requires authorization before use. • NOT ENFORCED: A license, which does not require authorization. • EXPORT RESTRICTED - ALLOWED: An export-controlled license that requires authorization, that is, a SLAC is installed. • EXPORT RESTRICTED - NOT ALLOWED: An export-controlled license that does not require the required authorization. An export-controlled license requires use. |

show license usage for Smart Licensing Using Policy

The following is sample output of the **show license usage** command on a Cisco Catalyst 9500 switch. Unenforced licenses are in-use here. Similar output is displayed on all supported Cisco Catalyst Access, Core, and Aggregation Switches.

```
Device# show license usage
License Authorization:
  Status: Not Applicable
network-advantage (C9500 Network Advantage):
  Description: network-advantage
  Count: 2
  Version: 1.0
  Status: IN USE
  Export status: NOT RESTRICTED
  Feature Name: network-advantage
  Feature Description: network-advantage
  Enforcement type: NOT ENFORCED
  License type: Perpetual
dna-advantage (C9500-16X DNA Advantage):
  Description: C9500-16X DNA Advantage
  Count: 2
  Version: 1.0
  Status: IN USE
  Export status: NOT RESTRICTED
  Feature Name: dna-advantage
  Feature Description: C9500-16X DNA Advantage
  Enforcement type: NOT ENFORCED
  License type: Subscription
```

show license usage for Smart Licensing

This example shows a sample output from the **show license usage** command:

```
Device# show license usage
License Authorization:
  Status: AUTHORIZED on Jul 27 08:38:49 2018 EDT

C9400 DNA Advantage (dna_advantage-C9400):
```

show license usage

```

Description: C9400 DNA Advantage
Count: 1
Version: 1.0
Status: AUTHORIZED

```

```

C9400 Network Advantage (advantagek9-C9400):
Description: C9400 Network Advantage
Count: 2
Version: 1.0
Status: AUTHORIZED

```

Related Commands

| Command | Description |
|----------------------------------|--|
| show license all | Displays entitlements information. |
| show license status | Displays compliance status of a license. |
| show license summary | Displays summary of all active licenses. |
| show license udi | Displays UDI. |
| show tech-support license | Displays the debug output. |

show location

To display location information for an endpoint, use the **show location** command in privileged EXEC mode.

show location

```
[{admin-tag | civic-location{identifier identifier-string | interface type number | static} |
custom-location{identifier identifier-string | interface type number | static} | elin-location{identifier
identifier-string | interface type number | static} | geo-location{identifier identifier-string | interface
type number | static} | host}]
```

| Syntax Description | | |
|---|--|---|
| admin-tag | | Displays administrative tag or site information. |
| civic-location | | Specifies civic location information. |
| identifier <i>identifier-string</i> | | Information identifier of the civic location, custom location, or geo-spatial location. |
| interface <i>type number</i> | | Interface type and number. For information about the numbering syntax for your device, use the question mark (?) online help function. |
| static | | Displays configured civic, custom, or geo-spatial location information. |
| custom-location | | Specifies custom location information. |
| elin-location | | Specifies emergency location information (ELIN). |
| geo-location | | Specifies geo-spatial location information. |
| host | | Specifies the civic, custom, or geo-spatial host location information. |

Command Default No default behavior or values.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

The following sample output of the **show location civic-location** command displays civic location information for the specified identifier (*identifier 1*):

```
Device# show location civic-location identifier 1
Civic location information
-----
Identifier           : 1
County              : Santa Clara
Street number       : 3550
Building            : 19
Room                : C6
Primary road name   : Example
```

 show location

```
City           : San Jose
State          : CA
Country        : US
```

Related Commands

| Command | Description |
|-----------------|--|
| location | Configures location information for an endpoint. |

show logging onboard uptime

To display a history of all reset reasons for the supervisor modules in a system, use the **show logging onboard uptime** command.

show logging onboard {**rp** {**active** | **standby** } | **slot** *slot-number* } **uptime** [[**continuous** | **detail**] [**start** *hour day month* [*year*] [**end** *hour day month year*]]] | **summary**]

| Syntax Description | | |
|---|--|--|
| active | | Specifies the active instance. |
| standby | | Specifies the standby instance. |
| slot <i>slot-number</i> | | Displays slot information. Enter the slot number. |
| continuous | | (Optional) Displays continuous data. |
| detail | | (Optional) Displays detailed data. |
| start <i>hour day month year</i> | | (Optional) Specifies the start time to display data. |
| end <i>hour day month year</i> | | (Optional) Specifies the end time to display data. |
| summary | | (Optional) Displays summary data. |

Command Modes Privileged EXEC(#)

| Command History | Release | Modification |
|-----------------|--------------------------------|--|
| | Cisco IOS XE Everest 16.6.1 | This command was implemented on the Cisco Catalyst 9400 Series Switches |
| | Cisco IOS XE Gibraltar 16.10.1 | The output of this command was updated to display the reload reasons for switching modules in a chassis. |

Examples:

The following is a sample output from the **show logging onboard rp active uptime detail** command:

```
Device# show logging onboard rp active uptime detail
```

show mac address-table

To display the MAC address table, use the **show mac address-table** command in privileged EXEC mode.

```
show mac address-table [{ address mac-addr [ interface type/number | vlan vlan-id ] | aging-time
[ routed-mac | vlan vlan-id ] | control-packet-learn | count [ summary | vlan vlan-id ] |[ dynamic
| secure | static ] [ address mac-addr ] [ interface type/number | vlan vlan-id ] | interface type/number
| learning [ vlan vlan-id ] | multicast [ count ] [ igmp-snooping | mld-snooping | user ] [ vlan
vlan-id ] | notification { change [ interface [ type/number ] ] | mac-move | threshold } | vlan
vlan-id }]
```

| Syntax Description | | |
|--|--|--|
| address <i>mac-addr</i> | (Optional) Displays information about the MAC address table for a specific MAC address. | |
| interface <i>type/number</i> | (Optional) Displays addresses for a specific interface. | |
| vlan <i>vlan-id</i> | (Optional) Displays addresses for a specific VLAN. | |
| aging-time [routed-mac vlan <i>vlan-id</i>] | (Optional) Displays the aging time for the routed MAC or VLAN. | |
| control-packet-learn | (Optional) Displays the controlled packet MAC learning parameters. | |
| count | (Optional) Displays the number of entries that are currently in the MAC address table. | |
| dynamic | (Optional) Displays only the dynamic addresses. | |
| secure | (Optional) Displays only the secure addresses. | |
| static | (Optional) Displays only the static addresses. | |
| learning | (Optional) Displays learnings of a VLAN or interface. | |
| multicast | (Optional) Displays information about the multicast MAC address table entries only. | |
| igmp-snooping | (Optional) Displays the addresses learned by Internet Group Management Protocol (IGMP) snooping. | |
| mld-snooping | (Optional) Displays the addresses learned by Multicast Listener Discover version 2 (MLDv2) snooping. | |
| user | (Optional) Displays the manually entered (static) addresses. | |
| notification change | Displays the MAC notification parameters and history table. | |
| notification mac-move | Displays the MAC-move notification status. | |
| notification threshold | Displays the Counter-Addressable Memory (CAM) table utilization notification status. | |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|---|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.12.4 | The output of the show mac address-table vlan <i>vlan-id</i> command has been updated to show the MAC addresses used for Cisco Software-Defined Access (SD-Access) solution. |

Usage Guidelines The *mac-addr* value is a 48-bit MAC address. The valid format is H.H.H.

The interface *number* argument designates the module and port number. Valid values depend on the specified interface type and the chassis and module that are used. For example, if you specify a Gigabit Ethernet interface and have a 48-port 10/100BASE-T Ethernet module that is installed in a 13-slot chassis, valid values for the module number are from 1 to 13 and valid values for the port number are from 1 to 48.

The following is sample output from the **show mac address-table** command:

```
Device# show mac address-table
```

```

The table below describes the significant fields shown in the **show mac address-table** display.

Table 218: show mac address-table Field Descriptions

| Field | Description |
|---------------------|---|
| VLAN | VLAN number. |
| Mac Address | MAC address of the entry. |
| Type | Type of address. |
| Ports | Port type. |
| Total MAC addresses | Total MAC addresses in the MAC address table. |

Related Commands

| Command | Description |
|--------------------------------|---|
| clear mac address-table | Deletes dynamic entries from the MAC address table. |

show mac address-table move update

To display the MAC address-table move update information on the device, use the **show mac address-table move update** command in EXEC mode.

show mac address-table move update

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes User EXEC
Privileged EXEC

Command History **Release**
Cisco IOS XE Everest 16.6.1

Example

This example shows the output from the **show mac address-table move update** command:

```
Device# show mac address-table move update

Switch-ID : 010b.4630.1780
Dst mac-address : 0180.c200.0010
Vlans/Macs supported : 1023/8320
Default/Current settings: Rcv Off/On, Xmt Off/On
Max packets per min : Rcv 40, Xmt 60
Rcv packet count : 10
Rcv conforming packet count : 5
Rcv invalid packet count : 0
Rcv packet count this min : 0
Rcv threshold exceed count : 0
Rcv last sequence# this min : 0
Rcv last interface : Po2
Rcv last src-mac-address : 0003.fd6a.8701
Rcv last switch-ID : 0303.fd63.7600
Xmt packet count : 0
Xmt packet count this min : 0
Xmt threshold exceed count : 0
Xmt pak buf unavail cnt : 0
Xmt last interface : None
```

show parser encrypt file status

To view the private configuration encryption status, use the **show parser encrypt file status** command.

show parser encrypt file status

Syntax Description This command has no arguments or keywords.

Command Default None

Command Modes User EXEC

| Command History | Release | Modification |
|-----------------|---------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.8.1a | This command was introduced. |

Examples

The following command output indicates that the feature is available and the file is encrypted. The file is in 'cipher text' format.

```
Device> enable
Device# show parser encrypt file status
Feature:           Enabled
File Format:       Cipher text
Encryption Version: ver1
```

Related Commands

| Command | Description |
|--|--|
| service private-config-encryption | Enables private configuration file encryption. |

show platform integrity

To display checksum record for the boot stages , use the **show platform integrity** command in privileged EXEC mode.

```
show platform integrity [sign [nonce <nonce>]]
```

| | | |
|---------------------------|---------------------|--------------------------------|
| Syntax Description | sign | (Optional) Show signature |
| | nonce | (Optional) Enter a nonce value |
| Command Modes | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | | This command was introduced. |

Examples

This example shows how to view the checksum record for boot stages :

```
Device# show platform integrity sign

show platform software audit

To display the SE Linux Audit logs, use the **show platform software audit** command in privileged EXEC mode.

```
show platform software audit {all | summary | [switch {switch-number | active | standby}]
{0 | F0 | R0 | {FP | RP} {active}}}
```

Syntax Description

| | |
|----------------------|---|
| all | Shows the audit log from all the slots. |
| summary | Shows the audit log summary count from all the slots. |
| switch | Shows the audit logs for a slot on a specific switch. |
| <i>switch-number</i> | Selects the switch with the specified switch number. |
| switch active | Selects the active instance of the switch. |
| standby | Selects the standby instance of the switch. |
| 0 | Shows the audit log for the SPA-Inter-Processor slot 0. |
| F0 | Shows the audit log for the Embedded-Service-Processor slot 0. |
| R0 | Shows the audit log for the Route-Processor slot 0. |
| FP active | Shows the audit log for the active Embedded-Service-Processor slot. |
| RP active | Shows the audit log for the active Route-Processor slot. |

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

Usage Guidelines

This command was introduced in the Cisco IOS XE Gibraltar 16.10.1 as a part of the SELinux Permissive Mode feature. The **show platform software audit** command displays the system logs containing the access violation events.

In Cisco IOS XE Gibraltar 16.10.1, operation in a permissive mode is available - with the intent of confining specific components (process or application) of the IOS-XE platform. In the permissive mode, access violation events are detected and system logs are generated, but the event or operation itself is not blocked. The solution operates mainly in an access violation detection mode.

The following is a sample output of the **show software platform software audit summary** command:

```
Device# show platform software audit summary
```

```
=====
AUDIT LOG ON switch 1
-----
AVC Denial count: 58
=====
```

The following is a sample output of the **show software platform software audit all** command:

```
Device# show platform software audit all
```

```

show platform software fed punt cause

To display information about why the packets received on an interface are punted to the Router Processor (RP), use the **show platform software fed punt cpuq cause** command in privileged EXEC mode.

show platform software fed {**active** | **standby**} **punt**{*cause_id* | **clear** | **summary**}

Syntax Description

active | **standby** Displays information about the switch. You have the following options:

- **active**—Displays information relating to the active switch.
- **standby**—Displays information relating to the standby switch, if available.

Note This keyword is not supported.

| | |
|-----------------|--|
| <i>cause_id</i> | Specifies the ID of the cause for which the details have to be displayed. |
| clear | Clears the statistics for all the causes. Clearing the causes might result in inconsistent statistics. |
| summary | Displays a high-level overview of the punt reason. |

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|--------------------------------|------------------------------|
| Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

Usage Guidelines

None

Example

The following is sample output from the **show platform software fed active punt cause summary** command.

```
Device# show platform software fed active punt cause summary
Statistics for all causes
```

| Cause | Cause Info | Rcvd | Dropped |
|-------|-------------------------------|--------|---------|
| 7 | ARP request or response | 1 | 0 |
| 21 | RP<->QFP keepalive | 22314 | 0 |
| 55 | For-us control | 12 | 0 |
| 60 | IP subnet or broadcast packet | 21 | 0 |
| 96 | Layer2 control protocols | 133808 | 0 |

The following is sample output from the **show platform software fed active punt cause** *cause-id* command.

```
Device# show platform software fed active punt cause 21
Detailed Statistics
```

| Sub Cause | Rcvd | Dropped |
|-----------|-------|---------|
| 0 | 22363 | 0 |

show platform software fed punt cpuq

To display information about the punt traffic on CPU queues, use the **show platform software fed punt cpuq** command in privileged EXEC mode.

show platform software fed {**active** | **standby**} **punt cpuq** {*cpuq_id* | **all** | **brief** | **clear** | **rates**}

| | | |
|---------------------------|--------------------------------|---|
| Syntax Description | active standby | Displays information about the switch. You have the following options: <ul style="list-style-type: none"> • active—Displays information relating to the active switch. • standby—Displays information relating to the standby switch, if available. <p>Note This keyword is not supported.</p> |
| | punt | Displays the punt information. |
| | cpuq | Displays information about the CPU receive queue. |
| | <i>cpuq_id</i> | Specifies details specific to a particular CPU queue. |
| | all | Displays the statistics for all the CPU queues. |
| | brief | Displays summarized statistics for all the queues like details about punt packets received and dropped. |
| | clear | Clears the statistics for all the CPU queues. Clearing the CPU queue might result in inconsistent statistics. |
| | rates | Displays the rate at which the packets are punted. |
| Command Default | None | |
| Command Modes | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| Usage Guidelines | None | |

Example

The following is sample output from the **show platform software fed active punt cpuq brief** command.

```
Device#show platform software fed active punt cpuq brief
```

```
Punt CPU Q Statistics Brief
```

```
=====
```

show platform software sl-infra

To display troubleshooting information and for debugging, enter the **show platform software sl-infra** command in privileged EXEC mode. The output of this command is used by the technical support team, for troubleshooting and debugging.

```
show platform software sl-infra { all | current | debug | stored }
```

Syntax Description

| | |
|----------------|--|
| all | Displays current, debugging, and stored information. |
| current | Displays current license-related information. |
| debug | Enables debugging |
| stored | Displays information that is stored on the product instance. |

Command Modes

Privileged EXEC (Device#)

Command History

| Release | Modification |
|--------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.3.2a | This command was introduced. |

Usage Guidelines

When you encounter an error message that you are not able to resolve, along with a copy of the message that appears on the console or in the system log, provide your Cisco technical support representative with sample output of these commands: **show license tech support**, **show license history message**, and the **show platform software sl-infra all** privileged EXEC commands.

show platform sudi certificate

To display checksum record for the specific SUDI, use the **show platform sudi certificate** command in privileged EXEC mode.

show platform sudi certificate [**sign** [**nonce** <nonce>]]

| | | |
|---------------------------|---------------------|--------------------------------|
| Syntax Description | sign | (Optional) Show signature |
| | nonce | (Optional) Enter a nonce value |
| Command Modes | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | | This command was introduced. |

Examples

This example shows how to view the checksum record for a specific SUDI :

```
# show platform sudi certificate

show running-config

To display the contents of the current running configuration file or the configuration for a specific module, Layer 2 VLAN, class map, interface, map class, policy map, or virtual circuit (VC) class, use the **show running-config** command in privileged EXEC mode.

show running-config [*options*]

Syntax Description

options (Optional) Keywords used to customize output. You can enter more than one keyword.

- **aaa** [**accounting** | **attribute** | **authentication** | **authorization** | **diameter** | **group** | **ldap** | **miscellaneous** | **radius-server** | **server** | **tacacs-server** | **user-name** | **username**]: Displays AAA configurations.
 - **all**: Expands the output to include the commands that are configured with default parameters. If the **all** keyword is not used, the output does not display commands configured with default parameters.
 - **bridge-domain** {**id** | **parameterized vlan**}: Displays the running configuration for bridge domains.
 - **brief**: Displays the configuration without certification data and encrypted filter details.
 - **class-map** [*name*] [**linenum**]: Displays class map information.
 - **cts** [**interface** | **policy-server** | **rbm-rbac** | **server** | **sxp**]: Displays Cisco TrustSec configurations.
 - **deprecated**: Displays deprecated configuration along with the running configuration.
 - **eap** {**method** | **profiles**}: Displays EAP method configurations and profiles.
 - **flow** {**exporter** | **monitor** | **record**}: Displays global flow configuration commands.
 - **full**: Displays the full configuration.
 - **identity** {**policy** | **profile**}: Displays identity profile or policy information.
-

- **interface** *type number*: Displays interface-specific configuration information. If you use the **interface** keyword, you must specify the interface type and the interface number (for example, **interface GigabitEthernet 1/0/1**). Use the **show run interface ?** command to determine the interfaces available on your system.
- **ip dhcp pool** [*name*]: Displays IPv4 DHCP pool configuration.
- **ipv6 dhcp pool** [*name*]: Displays IPv6 DHCP pool configuration.
- **linenum** [**brief** | **full** | **partition**]: Displays line numbers in the output.
- **map-class** [**atm** | **dialer** | **frame-relay**] [*name*]: Displays map class information.
- **mdns-sd** [**gateway** | **location-group** | **service-definition** | **service-list** | **service-peer** | **service-policy**]: Displays Multicast DNS Service Discovery (mDNS-SD) configurations.
- **partition** {**access-list** | **class-map** | **common** | **global-cdp** | **interface** | **ip-as-path** | **ip-community** | **ip-prefix-list** | **ip-static-routes** | **line** | **policy-map** | **route-map** | **router** | **snmp** | **tacacs**}: Displays the configuration corresponding to a partition.
- **policy-map** [*name*] [**linenum**]: Displays policy map information.
- **switch** *number*: Displays configuration for the specified switch.
- **view** [**full**]: Enables the display of a full running configuration. This is for view-based users who typically can only view the configuration commands that they are entitled to access for that particular view.
- **vlan** [*vlan-id*]: Displays the specific VLAN information; valid values are from 1 to 4094.
- **vrf** [*vrf-name*]: Displays the Virtual routing and forwarding (VRF)-aware configuration module number .

Command Default

The default syntax, **show running-config**, displays the contents of the running configuration file, except commands configured using the default parameters.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **show running-config** command is technically a command alias (substitute or replacement syntax) of the **more system:running-config** command. Although the use of more commands is recommended (because of their uniform structure across platforms and their expandable syntax), the **show running-config** command remains enabled to accommodate its widespread use, and to allow typing shortcuts such as **show run**.

The **show running-config interface** command is useful when there are multiple interfaces and you want to look at the configuration of a specific interface.

The **linenum** keyword causes line numbers to be displayed in the output. This option is useful for identifying a particular portion of a very large configuration.

You can enter additional output modifiers in the command syntax by including a pipe character (|) after the optional keyword. For example, **show running-config interface GigabitEthernet 1/0/1 linenum | begin 3**.

To display the output modifiers that are available for a keyword, enter `| ?` after the keyword. Depending on the platform you are using, the keywords and the arguments for the *options* argument may vary.

The **show running-config all** command displays complete configuration information, including the default settings and values. For example, if the Cisco Discovery Protocol (abbreviated as CDP in the output) hold-time value is set to its default of 180:

- The **show running-config** command does not display this value.
- The **show running-config all** displays the following output: `cdp holdtime 180`.

If the Cisco Discovery Protocol holdtime is changed to a nondefault value (for example, 100), the output of the **show running-config** and **show running-config all** commands is the same; that is, the configured parameter is displayed.

The **show running-config** command displays ACL information. To exclude ACL information from the output, use the **show running | section exclude ip access | access list** command.

Examples

The following example shows the configuration for GigabitEthernet0/0 interface. The fields are self-explanatory.

```
Device# show running-config interface gigabitEthernet0/0

Building configuration...

Current configuration : 130 bytes
!
interface GigabitEthernet0/0
 vrf forwarding Mgmt-vrf
 ip address 10.5.20.10 255.255.0.0
 negotiation auto
 ntp broadcast
end
```

The following example shows how to set line numbers in the command output and then use the output modifier to start the display at line 10. The fields are self-explanatory.

```
Device# show running-config linenum | begin 10

Related Commands

| Command | Description |
|---|--|
| copy running-config startup-config | Copies the running configuration to the startup configuration. (Command alias for the copy system:running-config nvram:startup-config command.) |
| show startup-config | Displays the contents of NVRAM (if present and valid) or displays the configuration file pointed to by the CONFIG_FILE environment variable. (Command alias for the more:nvram startup-config command.) |

show sdm prefer

To display information about the templates that can be used to maximize system resources for a particular feature, use the **show sdm prefer** command in privileged EXEC mode. To display the current template, use the command without a keyword.

show sdm prefer [**advanced**]

| | |
|---------------------------|---|
| Syntax Description | advanced (Optional) Displays information on the advanced template. |
|---------------------------|---|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-----------------|
| Command Modes | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | If you did not reload the device after entering the sdm prefer global configuration command, the show sdm prefer privileged EXEC command displays the template currently in use and not the newly configured template. |
|-------------------------|--|

The numbers displayed for each template represent an approximate maximum number for each feature resource. The actual number might vary, depending on the actual number of other features configured. For example, in the default template if your device had more than 16 routed interfaces (subnet VLANs), the number of possible unicast MAC addresses might be less than 6000.

Example

The following is sample output from the **show sdm prefer** command:

```
Device# show sdm prefer

Showing SDM Template Info

This is the Advanced template.
Number of VLANs:          4094
Unicast MAC addresses:    32768
Overflow Unicast MAC addresses:  512
IGMP and Multicast groups:  8192
Overflow IGMP and Multicast groups:  512
Directly connected routes:  32768
Indirect routes:          7680
Security Access Control Entries:  3072
QoS Access Control Entries:  3072
Policy Based Routing ACEs:    1024
Netflow ACEs:                1024
Input Microflow policer ACEs:  256
Output Microflow policer ACEs: 256
Flow SPAN ACEs:             256
Tunnels:                     256
```

```
Control Plane Entries:      512
Input Netflow flows:       8192
Output Netflow flows:      16384
SGT/DGT entries:           4096
SGT/DGT Overflow entries:  512
```

These numbers are typical for L2 and IPv4 features.
Some features such as IPv6, use up double the entry size;
so only half as many entries can be created.

show tech-support confidential

To hide confidential information from the **show tech-support** output, use the **show tech-support confidential** command in privileged EXEC mode.

show tech-support confidential output *file-name*

| | | |
|---------------------------|--|---|
| Syntax Description | output <i>file-name</i> | Specifies the output file where the tech-support data is to be saved. |
| Command Default | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |
| Usage Guidelines | <p>The show tech-support confidential command will hide sensitive data like MAC addresses, IP addresses, and passwords. The output will be the same as that of the show tech-support command with all the customer-specific data masked.</p> <p>The output from the show tech-support confidential command is very long. To better manage this output, you can redirect the output to a file in the local writable storage file system or the remote file system by using the show tech-support confidential output <i>location:filename</i>). Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.</p> <pre>Device# show tech-support confidential output flash:tech_confidential Collecting tech-support without confidential info, it will take few min..</pre> <p>To view the output of the redirected file, use the command more <i>location:filename</i>.</p> | |

show tech-support monitor

To display the SPAN monitor information, use the **show tech-support monitor** command in privileged EXEC mode.

show tech-support monitor [**{switch** *switch-number* | **active** | **standby**}]

| Syntax Description | | |
|--------------------|----------------------|---|
| | <i>switch-number</i> | Specifies the switch. |
| | active | Specifies the active instance of the switch. |
| | standby | Specifies the standby instance of the switch. |

Command Default Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-------------------------------|------------------------------|
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |

Usage Guidelines The output from the **show tech-support monitor** command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support monitor** [**switch** *switch-number* | **active** | **standby**] | **redirect location:filename**) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.

To view the output of the redirected file, use the command **more location:filename**.

show tech-support platform

To display detailed information about a platform for use by technical support, use the **show tech-support platform** command in privileged EXEC mode.

show tech-support platform

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

Usage Guidelines This command is used for platform-specific debugging. The output provides detailed information about a platform, such as CPU usage, Ternary Content Addressable Memory (TCAM) usage, capacity, and memory usage.

The output of the **show tech-support platform** command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support platform | redirect flash:filename**) in the local writable storage file system or remote file system.

The output of the **show tech-support platform** command displays a list commands and their output. These commands may differ based on the platform.

Examples

The following is sample output from the **show tech-support platform** command:

```
Device# show tech-support platform
.
.
.
----- show platform hardware capacity -----

Load Average
  Slot  Status  1-Min  5-Min 15-Min
1-RP0 Healthy  0.25  0.17  0.12

Related Commands

| Command | Description |
|---|--|
| show tech-support platform evpn_vxlan | Displays EVPN-VXLAN-related platform information. |
| show tech-support platform fabric | Displays detailed information about the switch fabric. |
| show tech-support platform igmp_snooping | Displays IGMP snooping information about a group. |
| show tech-support platform layer3 | Displays Layer 3 platform forwarding information. |
| show tech-support platform mld_snooping | Displays MLD snooping information about a group. |

show tech-support platform evpn_vxlan

To display Ethernet VPN (EVPN)-Virtual eXtensible LAN (VXLAN)-related platform information for use by technical support, use the **show tech-support platform evpn_vxlan** command in privileged EXEC mode.

show tech-support platform evpn_vxlan switch *switch-number*

| | | |
|---------------------------|---|--|
| Syntax Description | switch <i>switch-number</i> | Displays information for the specified switch. Valid values are from 1 to 9. |
| Command Modes | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| Usage Guidelines | The output of this command is very long. To better manage this output, you can redirect the output to an external file (for example, show tech-support platform evpn_vxlan switch 1 redirect flash:filename) in the local writable storage file system or remote file system. | |

Examples

The following is sample output from the **show tech-support platform evpn_vxlan** command:

```
Device# show tech-support platform evpn_vxlan switch 1
.
.
.
    "show clock"
    "show version"
    "show running-config"switch no: 1

----- sh sdm prefer -----

MPLS L3 VPN Routes Prefix Mode:    3072
MVPN MDT Tunnels:                  256
L2 VPN EOMPLS Attachment Circuit:  256
MAX VPLS Bridge Domains :          64
MAX VPLS Peers Per Bridge Domain:  8
MAX VPLS/VPWS Pseudowires :       256

```

These numbers are typical for L2 and IPv4 features.
Some features such as IPv6, use up double the entry size;
so only half as many entries can be created.
* values can be modified by sdm cli.

Related Commands

| Command | Description |
|-----------------------------------|--|
| show tech-support platform | Displays detailed information about a platform for use by technical support. |

show tech-support platform fabric

To display information about the switch fabric, use the **show tech-support platform fabric** command in privileged EXEC mode.

```
show tech-support platform fabric [{display-cli | vrf vrf-name {ipv4 display-cli | ipv6 display-cli |
source instance-id instance-id {ipv4 ip-address/ip-prefix | ipv6 ipv6-address/ipv6-prefix | mac mac-address}
{dest instance-id instance-id} {ipv4 ip-address/ip-prefix | ipv6 ipv6-address/ipv6-prefix | mac mac-address}
[{display-cli}]}]]
```

| Syntax Description | | |
|---|--|--|
| display-cli | | (Optional) Displays the list of show commands available in the output of this command. |
| vrf <i>vrf-name</i> | | (Optional) Displays fabric-related information for the specified virtual routing and forwarding (VRF) instance. |
| ipv4 <i>ip-address/ip-prefix</i> | | (Optional) Displays fabric-related information for the source or destination IP VRF. |
| ipv6 <i>ipv6-address/ipv6-prefix</i> | | (Optional) Displays fabric-related information for the source or destination IPv6 VRF. |
| source | | (Optional) Displays fabric-related information for the source VRF. |
| instance-id <i>instance-id</i> | | (Optional) Displays information about the endpoint identifier (EID) of the source. |
| mac <i>mac-address</i> | | (Optional) Displays fabric-related information for the source and destination MAC VRF for Layer 2 extension deployments. |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

Usage Guidelines The output of this command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support platform fabric | redirect flash:filename**) in the local writable storage file system or remote file system.

The output of this command displays a list commands and their output. These commands may differ based on the platform.

Examples

The following is sample output from the **show tech-support platform fabric vrf source instance-id ipv4 dest instance-id ipv4** command:

```
Device# show tech-support platform fabric vrf DEFAULT_VN source instance-id

Related Commands

| Command | Description |
|-----------------------------------|--|
| show tech-support platform | Displays detailed information about a platform for use by technical support. |

show tech-support platform mld_snooping

To display Multicast Listener Discovery (MLD) snooping information about a group, use the **show tech-support platform mld_snooping** command in privileged EXEC mode.

```
show tech-support platform mld_snooping [{Group_ipv6Addr ipv6-address }][{vlan vlan-ID}]
```

| Syntax Description | Group_ipv6Addr | (Optional) Displays snooping information about the specified group address. |
|--------------------|----------------------------|---|
| | <i>ipv6-address</i> | (Optional) IPv6 address of the group. |
| | vlan <i>vlan-ID</i> | (Optional) Displays MLD snooping VLAN information. Valid values are from 1 to 4094. |

| Command Modes | Privileged EXEC (#) |
|---------------|---------------------|
|---------------|---------------------|

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

Usage Guidelines The output of this command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support platform mld_snooping | redirect flash:filename**) in the local writable storage file system or remote file system.

Examples

The following is sample output from the **show tech-support platform mld_snooping** command:

```
Device# show tech-support platform mld_snooping GroupIPv6Addr FF02::5:1
```

```
.
.

Related Commands

| Command | Description |
|-----------------------------------|--|
| ipv6 mld snooping | Enables MLDv2 protocol snooping globally. |
| show ipv6 mld snooping | Displays MLDv2 snooping information. |
| show tech-support platform | Displays detailed information about a platform for use by technical support. |

show tech-support port

To display port-related information for use by technical support, use the **show tech-support port** command in privileged EXEC mode.

show tech-support port

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |

Usage Guidelines The output of the **show tech-support port** command is very long. To better manage this output, you can redirect the output to an external file (for example, **show tech-support port | redirect flash:filename**) in the local writable storage file system or remote file system.

The output of this command displays the following commands:

Cisco Catalyst 9400 Series Switches with Stackwise Virtual Link

- **show clock**
- **show version**
- **show module**
- **show inventory**
- **show interface status**
- **show interface counters**
- **show interface counters errors**
- **show interfaces**
- **show interfaces capabilities**
- **show controllers**
- **show controllers utilization**
- **show idprom interface**
- **show controller ethernet-controller phy detail**
- **show switch**
- **show platform software fed switch active port summary**
- **show platform software fed switch ifm interfaces ethernet**
- **show platform software fed switch ifm mappings**

- **show platform software fed switch ifm mappings lpn**
- **show platform software fed switch ifm mappings gpn**
- **show platform software fed switch ifm mappings port-le**
- **show platform software fed switch ifm if-id**
- **show platform software fed switch active port if_id**

Cisco Catalyst 9400 Series Switches without Stackwise Virtual Link

- **show clock**
- **show version**
- **show module**
- **show inventory**
- **show interface status**
- **show interface counters**
- **show interface counters errors**
- **show interfaces**
- **show interfaces capabilities**
- **show controllers**
- **show controllers utilization**
- **show idprom interface**
- **show controller ethernet-controller phy detail**
- **show platform software fed active port summary**
- **show platform software fed ifm interfaces ethernet**
- **show platform software fed ifm mappings**
- **show platform software fed ifm mappings lpn**
- **show platform software fed ifm mappings gpn**
- **show platform software fed ifm mappings port-le**
- **show platform software fed ifm if-id**
- **show platform software fed active port if_id**

Examples

The following is sample output from the **show tech-support port** command:

```
Device# show tech-support port
.
```

```

The output fields are self-explanatory.

show tech-support pvlan

To display the private VLAN related information, use the **show tech-support pvlan** command in privileged EXEC mode.

show tech-support pvlan [{**pvlan_id** *pvlan-id*}]

| | | |
|---------------------------|--|--------------------------------|
| Syntax Description | pvlan_id <i>pvlan-id</i> | Specifies the private VLAN ID. |
| Command Default | Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Amsterdam 17.3.1 | This command was introduced. |
| Usage Guidelines | <p>The output from the show tech-support pvlan command is very long. To better manage this output, you can redirect the output to a file in the local writable storage file system or the remote file system by using the show tech-support pvlan [pvlan_id <i>pvlan-id</i>] redirect <i>location:filename</i>). Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.</p> <p>To view the output of the redirected file, use the command more <i>location:filename</i>.</p> | |

show version

To display information about the currently loaded software along with hardware and device information, use the **show version** command in user EXEC or privileged EXEC mode.

show version [*{switch node}*][*{installed | provisioned | running}*]

| Syntax Description | switch <i>node</i> | (optional) Only a single switch may be specified. Default is all switches in a stacked system. |
|--------------------|-----------------------|--|
| | running | (optional) Specifies information on the files currently running. |
| | provisioned | (optional) Specifies information on the software files that are provisioned. |
| | installed | Specifies information on the software installed on the RP |
| | user-interface | Specifies information on the files related to the user-interface. |

Command Default No default behavior or values.

Command Modes User EXEC (>)

Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines This command displays information about the Cisco IOS software version currently running on a device, the ROM Monitor and Bootflash software versions, and information about the hardware configuration, including the amount of system memory. Because this command displays both software and hardware information, the output of this command is the same as the output of the **show hardware** command. (The **show hardware** command is a command alias for the **show version** command.)

Specifically, the **show version** command provides the following information:

- Software information
 - Main Cisco IOS image version
 - Main Cisco IOS image capabilities (feature set)
 - Location and name of bootfile in ROM
 - Bootflash image version (depending on platform)
- Device-specific information
 - Device name
 - System uptime
 - System reload reason
 - Config-register setting
 - Config-register settings for after the next reload (depending on platform)

- Hardware information
 - Platform type
 - Processor type
 - Processor hardware revision
 - Amount of main (processor) memory installed
 - Amount I/O memory installed
 - Amount of Flash memory installed on different types (depending on platform)
 - Processor board ID

The output of this command uses the following format:

```
Cisco IOS Software, <platform> Software (<image-id>), Version <software-version>,
  <software-type>

Technical Support: http://www.cisco.com/techsupport
Copyright (c) <date-range> by Cisco Systems, Inc.
Compiled <day> <date> <time> by <compiler-id>

ROM: System Bootstrap, Version <software-version>, <software-type>
BOOTLDR: <platform> Software (image-id), Version <software-version>, <software-type>

<router-name> uptime is <w> weeks, <d> days, <h> hours,
<m> minutes
System returned to ROM by reload at <time> <day> <date>
System image file is "<filesystem-location>/<software-image-name>"
Last reload reason: <reload-reason>Cisco <platform-processor-type>
processor (revision <processor-revision-id>) with <free-DRAM-memory>
K/<packet-memory>K bytes of memory.
Processor board ID <ID-number>

<CPU-type> CPU at <clock-speed>Mhz, Implementation <number>, Rev <
Revision-number>, <kilobytes-Processor-Cache-Memory>KB <cache-Level> Cache
```

See the Examples section for descriptions of the fields in this output.

Entering **show version** displays the IOS XE software version and the IOS XE software bundle which includes a set of individual packages that comprise the complete set of software that runs on the switch.

The **show version running** command displays the list of individual packages that are currently running on the switch. When booted in installed mode, this is typically the set of packages listed in the booted provisioning file. When booted in bundle mode, this is typically the set of packages contained in the bundle.

The **show version provisioned** command displays information about the provisioned package set.

The following is sample output from the **show version** command on a Cisco Catalyst 9300 Series Switch:

```
Device# show version
Cisco IOS XE Software, Version BLD_V1610_THROTTLE_LATEST_20180903_070602_V16_10_0_101_2
Cisco IOS Software [Fuji], Catalyst L3 Switch Software (CAT9K_IOSXE), Experimental Version
 16.10.20180903:072347
[v1610_throttle-/nobackup/mcpre/BLD-BLD_V1610_THROTTLE_LATEST_20180903_070602 183]
Copyright (c) 1986-2018 by Cisco Systems, Inc.

```

In the following example, the **show version provisioned** command is entered on a Cisco Catalyst 9300 Series Switch that is the active switch in a 2-member stack. The **show version provisioned** command displays information about the packages in the provisioned package set.

```

Device# show version provisioned
Package: Provisioning File, version: n/a, status: active
  Role: provisioning file
  File: /flash/packages.conf, on: RP0
  Built: n/a, by: n/a
  File SHA1 checksum: 6a43991bae5b94de0df8083550f827a3c01756c5

```

Table 220: Table 5, show version running Field Descriptions

| Field | Description |
|----------|--|
| Package: | The individual sub-package name. |
| version: | The individual sub-package version. |
| status: | Reveals if the package is active or inactive for the specific Supervisor module. |
| File: | The filename of the individual package file. |
| on: | The slot number of the Active or Standby Supervisor that this package is running on. |
| Built: | The date the individual package was built. |

test cable-diagnostics tdr

To run the Time Domain Reflector (TDR) feature on an interface, use the **test cable-diagnostics tdr** command in privileged EXEC mode.

```
test cable-diagnostics tdr interface interface-id
```

| | |
|---------------------------|--|
| Syntax Description | <i>interface-id</i> The interface on which to run TDR. |
|---------------------------|--|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-----------------|
| Command Modes | Privileged EXEC |
|----------------------|-----------------|

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports or small form-factor pluggable (SFP) module ports. |
|-------------------------|--|

After you run TDR by using the **test cable-diagnostics tdr interface** *interface-id* command, use the **show cable-diagnostics tdr interface** *interface-id* privileged EXEC command to display the results.

This example shows how to run TDR on an interface:

```
Device# test cable-diagnostics tdr interface gigabitethernet1/0/2
TDR test started on interface Gi1/0/2
A TDR test can take a few seconds to run on an interface
Use 'show cable-diagnostics tdr' to read the TDR results
```

If you enter the **test cable-diagnostics tdr interface** *interface-id* command on an interface that has an link up status and a speed of 10 or 100 Mb/s, these messages appear:

```
Device# test cable-diagnostics tdr interface gigabitethernet1/0/3
TDR test on Gi1/0/9 will affect link state and traffic
TDR test started on interface Gi1/0/3
A TDR test can take a few seconds to run on an interface
Use 'show cable-diagnostics tdr' to read the TDR results.
```

thermal shutdown disable

To disable the system thermal shutdown feature on the switch, use the **thermal shutdown disable** command in global configuration mode.

thermal shutdown disable

Command Modes Global Configuration

| Command History | Release | Modification |
|-----------------|--------------------------------|------------------------------|
| | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

Usage Guidelines In order for the switch to boot with the system thermal shutdown feature disabled, you must first save the updated configuration to the start-up config. After the next power cycle or reload, the switch now boots with the thermal shutdown disabled.

When the system enters a shutdown state after the thermal shutdown disable option is configured, the following syslog message will appear on the console:

```
%CMRP_ENVMON-6-TEMP_SYS_SHUTDOWN_DISABLED: R0/0: cmand: WARNING: System is in a thermal shutdown disabled state. System won't shut down now
```

The following example shows how to configure the thermal shutdown disable feature on a switch:

```
Device# configure terminal
Device(config)# thermal shutdown disable

WARNING!Are you sure that you want to proceed with disabling system thermal shutdown??
[yes/no]: yes
```

traceroute mac

To display the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address, use the **traceroute mac** command in privileged EXEC mode.

```
traceroute mac [ interface interface-id ] source-mac-address [ interface interface-id ]
destination-mac-address [ vlan vlan-id ] [ detail ]
```

Syntax Description

| | |
|--------------------------------------|--|
| interface <i>interface-id</i> | (Optional) Specifies an interface on the source or destination device. |
| <i>source-mac-address</i> | The MAC address of the source device in hexadecimal format. |
| <i>destination-mac-address</i> | The MAC address of the destination device in hexadecimal format. |
| vlan <i>vlan-id</i> | (Optional) Specifies the VLAN on which to trace the Layer 2 path that the packets take from the source device to the destination device. Valid VLAN IDs are 1 to 4094. |
| detail | (Optional) Specifies that detailed information appears. |

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-------------------------------|---|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Bengaluru 17.5.1 | aborted was replaced with terminated in the output error message for the traceroute mac command. |

Usage Guidelines

For Layer 2 traceroute to function properly, Cisco Discovery Protocol (CDP) must be enabled on all of the devices in the network. Do not disable CDP.

When the device detects a device in the Layer 2 path that does not support Layer 2 traceroute, the device continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.

Layer 2 traceroute supports only unicast traffic. If you specify a multicast source or destination MAC address, the physical path is not identified, and an error message appears.

The **traceroute mac** command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN.

If you specify source and destination addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong.

If the VLAN is not specified, the path is not identified, and an error message appears.

The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port).

When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5          (2.2.5.5   ) :   Gi0/0/3 => Gi0/0/1
con1          (2.2.1.1   ) :   Gi0/0/1 => Gi0/0/2
con2          (2.2.2.2   ) :   Gi0/0/2 => Gi0/0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed
```

This example shows how to display the Layer 2 path by using the **detail** keyword:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201 detail
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)
con6 / WS-C3750E-24PD / 2.2.6.6 :
    Gi0/0/2 [auto, auto] => Gi0/0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
    Fa0/3 [auto, auto] => Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the interfaces on the source and destination devices:

```
Device# traceroute mac interface fastethernet0/1 0000.0201.0601 interface fastethernet0/3
0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5          (2.2.5.5   ) :   Gi0/0/3 => Gi0/0/1
con1          (2.2.1.1   ) :   Gi0/0/1 => Gi0/0/2
con2          (2.2.2.2   ) :   Gi0/0/2 => Gi0/0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed
```

This example shows the Layer 2 path when the device is not connected to the source device:

```
Device# traceroute mac 0000.0201.0501 0000.0201.0201 detail
Source not directly connected, tracing source .....
```

```
Source 0000.0201.0501 found on con5[WS-C3750E-24TD] (2.2.5.5)
con5 / WS-C3750E-24TD / 2.2.5.5 :
    Gi0/0/1 [auto, auto] => Gi0/0/3 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows the Layer 2 path when the device cannot find the destination port for the source MAC address:

```
Device# traceroute mac 0000.0011.1111 0000.0201.0201
Error:Source Mac address not found.
Layer2 trace terminated.
```

This example shows the Layer 2 path when the source and destination devices are in different VLANs:

```
Device# traceroute mac 0000.0201.0601 0000.0301.0201
Error:Source and destination macs are on different vlans.
Layer2 trace terminated.
```

This example shows the Layer 2 path when the destination MAC address is a multicast address:

```
Device# traceroute mac 0000.0201.0601 0100.0201.0201
Invalid destination mac address
```

This example shows the Layer 2 path when source and destination devices belong to multiple VLANs:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201
Error:Mac found on multiple vlans.
Layer2 trace terminated.
```

traceroute mac ip

To display the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname, use the **traceroute mac ip** command in privileged EXEC mode.

```
traceroute mac ip { source-ip-address source-hostname } { destination-ip-address destination-hostname } [detail]
```

Syntax Description

| | |
|-------------------------------|---|
| <i>source-ip-address</i> | The IP address of the source device as a 32-bit quantity in dotted-decimal format. |
| <i>source-hostname</i> | The IP hostname of the source device. |
| <i>destination-ip-address</i> | The IP address of the destination device as a 32-bit quantity in dotted-decimal format. |
| <i>destination-hostname</i> | The IP hostname of the destination device. |
| detail | (Optional) Specifies that detailed information appears. |

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-------------------------------|--|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Cisco IOS XE Bengaluru 17.5.1 | aborted was replaced with terminated in the output error message for the traceroute mac ip command. |

Usage Guidelines

For Layer 2 traceroute to function properly, Cisco Discovery Protocol (CDP) must be enabled on each device in the network. Do not disable CDP.

When the device detects a device in the Layer 2 path that does not support Layer 2 traceroute, the device continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.

The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet.

When you specify the IP addresses, the device uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the device uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the device sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and an error message appears.

The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port).

When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the **detail** keyword:

```
Device# tracroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac ....
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201

Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / WS-C3750E-24TD / 2.2.6.6 :
    Gi0/0/1 [auto, auto] => Gi0/0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
    Fa0/3 [auto, auto] => Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

```
Device# tracroute mac ip con6 con2
Translating IP to mac ....
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201

Source 0000.0201.0601 found on con6
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5           (2.2.5.5       ) :   Gi0/0/3 => Gi0/1
con1           (2.2.1.1       ) :   Gi0/0/1 => Gi0/2
con2           (2.2.2.2       ) :   Gi0/0/2 => Fa0/1
Destination 0000.0201.0201 found on con2
Layer 2 trace completed
```

This example shows the Layer 2 path when ARP cannot associate the source IP address with the corresponding MAC address:

```
Device# tracroute mac ip 2.2.66.66 2.2.77.77
Arp failed for destination 2.2.77.77.
Layer2 trace terminated.
```

type

To display the contents of one or more files, use the **type** command in boot loader mode.

type *filesystem:/file-url...*

| | |
|---------------------------|---|
| Syntax Description | <i>filesystem:</i> Alias for a file system. Use flash: for the system board flash device; use usbflash0: for USB memory sticks. |
|---------------------------|---|

| |
|---|
| <i>/file-url...</i> Path (directory) and name of the files to display. Separate each filename with a space. |
|---|

| | |
|------------------------|--------------------------------|
| Command Default | No default behavior or values. |
|------------------------|--------------------------------|

| | |
|----------------------|-------------|
| Command Modes | Boot loader |
|----------------------|-------------|

| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
|-----------------------------|---|---------|--------------|-----------------------------|------------------------------|
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

| | |
|-------------------------|--|
| Usage Guidelines | <p>Filenames and directory names are case sensitive.</p> <p>If you specify a list of files, the contents of each file appear sequentially.</p> |
|-------------------------|--|

| | |
|-----------------|--|
| Examples | <p>This example shows how to display the contents of a file:</p> |
|-----------------|--|

```

info_end:
```

unset

To reset one or more environment variables, use the **unset** command in boot loader mode.

unset *variable...*

Syntax Description

variable

Use one of these keywords for *variable*:

MANUAL_BOOT—Specifies whether the device automatically or manually boots.

BOOT—Resets the list of executable files to try to load and execute when automatically booting. If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash: file system.

ENABLE_BREAK—Specifies whether the automatic boot process can be interrupted by using the **Break** key on the console after the flash: file system has been initialized.

HELPER—Identifies the semicolon-separated list of loadable files to dynamically load during the boot loader initialization. Helper files extend or patch the functionality of the boot loader.

PS1—Specifies the string that is used as the command-line prompt in boot loader mode.

CONFIG_FILE—Resets the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.

BAUD—Resets the rate in bits per second (b/s) used for the console. The Cisco IOS software inherits the baud rate setting from the boot loader and continues to use this value unless the configuration file specifies another setting.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

Under typical circumstances, it is not necessary to alter the setting of the environment variables.

The **MANUAL_BOOT** environment variable can also be reset by using the **no boot manual** global configuration command.

The **BOOT** environment variable can also be reset by using the **no boot system** global configuration command.

The **ENABLE_BREAK** environment variable can also be reset by using the **no boot enable-break** global configuration command.

The HELPER environment variable can also be reset by using the **no boot helper** global configuration command.

The CONFIG_FILE environment variable can also be reset by using the **no boot config-file** global configuration command.

Example

This example shows how to unset the SWITCH_PRIORITY environment variable:

```
Device: unset SWITCH_PRIORITY
```

upgrade rom-monitor capsule

To upgrade the read-only memory monitor (ROMMON) by using the capsule method, use the **upgrade rom-monitor capsule** command in privileged EXEC mode.

Standalone Devices

```
upgrade rom-monitor capsule {golden | primary} [{R0 | RP active}]
```

Device with High Availability

```
upgrade rom-monitor capsule {golden | primary} [{R0 | R1 | RP {active | standby}}]
```

Device with StackWise Virtual

```
upgrade rom-monitor capsule {golden | primary} [{R0 | R1 | RP {active | standby} | switch {switch_number | active | standby} {R0 | R1 | RP {active | standby}}}]
```

Syntax Description

| | |
|--|---|
| golden | Specifies the golden ROMMON to be upgraded. |
| primary | Specifies the primary ROMMON to be upgraded. |
| R0 | Upgrades the ROMMON of the Route Processor (RP) slot 3. |
| R1 | Upgrades the ROMMON of the RP slot 4. |
| RP {active standby} | Upgrades the ROMMON of the RP slot 1 and slot 2. <ul style="list-style-type: none"> • active: Specifies the active instance. • standby: Specifies the standby instance. |
| switch {switch_number active standby} | Specifies the switch. <ul style="list-style-type: none"> • <i>switch_number</i>: ID of the switch. The range is from 1 to 2. • active: Specifies the active switch. • standby: Specifies the standby switch. |

Command Default

This command has no default settings.

Command Modes

Privileged EXEC (#)

Command History

| Release | Modification |
|-------------------------------|------------------------------|
| Cisco IOS XE Amsterdam 17.1.1 | This command was introduced. |

Usage Guidelines

To know if a ROMMON version upgrade is applicable to a software version, see the release notes of the corresponding software release:

<https://www.cisco.com/c/en/us/support/switches/catalyst-9400-series-switches/products-release-notes-list.html>

Examples

This example shows how to upgrade the golden ROMMON on a device with StackWise Virtual:

```
Device# upgrade rom-monitor capsule golden switch active R0

This operation will reload the switch and take a few minutes to complete.
Do you want to proceed (y/n)? [confirm]y

Device#

Initializing Hardware .....

!
!
!

Warning : New region (type 2) access rights will be modified

Updating Block at FFFFF000h 100%

Restarting switch to complete capsule upgrade

<output truncated>
```

version

To display the boot loader version, use the **version** command in boot loader mode.

version

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes Boot loader

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples This example shows how to display the boot loader version on a device:

Information About Tracing

Information About Trace Management

The tracing functionality logs internal events. Trace files are automatically created and saved on the persistent storage device of specific platforms.

The contents of trace files are useful to troubleshoot if a device has an issue. The trace file outputs provide information that can be used for locating and solving the issue, and helps to get a detailed view of system actions and operations.

To view the most recent trace information for a specific process, use the **show logging [process | Profile | process-helper]** command. The process uses the name of the process, the profile lists predefined set of process names, and the profile-helper displays the available names.

To change the verbosity in a trace message output, you can adjust the trace level of processes using the **set platform software trace level** command. You can choose the **all** keyword to adjust the trace level for all the processes listed or you can select a specific process. When you select a specific process, there is also the option of adjust the trace level for a specific module or the **all-modules** keyword can be used to adjust all the process's modules.

Tracing Levels

Trace level determines the types of traces outputted. Each trace message is assigned a trace level. If the trace level of a process or its module is set at a greater than or equal to level as the trace message, the trace message is displayed otherwise, it is skipped. For example, the default trace level is **Notice** level, so all traces with the **Notice** level and below the notice level are included while the traces above the **Notice** level are excluded.

The following table shows all of the tracing levels that are available, and provides descriptions of the message that are displayed with each tracing level. The tracing levels listed in the table are from the lowest to the highest order. The default trace level is **Notice**.

Table 221: Tracing Levels and Descriptions

| Tracing Level | Description |
|---------------|--|
| Fatal | The message stating the process is aborted. |
| Emergency | The message is regarding an issue that makes the system unusable. |
| Alert | The message indicating that an action must be taken immediately. |
| Critical | The message is regarding a critical event causing loss of important functions. |
| Error | The message is regarding a system error. |
| Warning | The message is regarding a system warning. |
| Notice | The message is regarding a significant event. |

| Tracing Level | Description |
|---------------|---|
| Informational | The message is useful for informational purposes only. |
| Debug | The message provides debug-level output. |
| Verbose | All possible trace messages are sent. |
| Noise | All possible trace messages for the module are logged. The noise level is always equal to the highest possible tracing level. Even if a future enhancement to tracing introduces a higher tracing level, the noise level will become equal to the level of that new enhancement. |

set platform software trace

To set the trace level for a specific module within a process, use the **set platform software trace** command in privileged EXEC or user EXEC mode.

set platform software trace *process slot module trace-level*

Syntax Description

process

Process whose tracing level is being set. Options include:

- **chassis-manager**—The Chassis Manager process.
 - **cli-agent**—The CLI Agent process.
 - **dbm**—The Database Manager process.
 - **emd**—The Environmental Monitoring process.
 - **fed**—The Forwarding Engine Driver process.
 - **forwarding-manager**—The Forwarding Manager process.
 - **host-manager**—The Host Manager process.
 - **iomd**—The Input/Output Module daemon (IOMd) process.
 - **ios**—The IOS process.
 - **license-manager**—The License Manager process.
 - **logger**—The Logging Manager process.
 - **platform-mgr**—The Platform Manager process.
 - **pluggable-services**—The Pluggable Services process.
 - **replication-mgr**—The Replication Manager process.
 - **shell-manager**—The Shell Manager process.
 - **smd**—The Session Manager process.
 - **table-manager**—The Table Manager Server.
 - **wireless**—The wireless controller module process.
 - **wireshark**—The Embedded Packet Capture (EPC) Wireshark process.
-

| | |
|---------------|---|
| <i>slot</i> | <p>Hardware slot where the process for which the trace level is set, is running. Options include:</p> <ul style="list-style-type: none">• <i>number</i>—Number of the SIP slot of the hardware module where the trace level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2.• <i>SIP-slot / SPA-bay</i>—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2.• F0—The Embedded-Service-Processor in slot 0.• FP active—The active Embedded-Service-Processor.• R0—The route processor in slot 0.• RP active—The active route processor.• switch <number> —The switch with its number specified.• switch active—The active switch.• switch standby—The standby switch. |
| <i>module</i> | Module within the process for which the tracing level is set. |

trace-level

Trace level. Options include:

- **debug**—Debug level tracing. A debug-level trace message is a non-urgent message providing a large amount of detail about the module.
 - **emergency**—Emergency level tracing. An emergency-level trace message is a message indicating that the system is unusable.
 - **error**—Error level tracing. An error-level tracing message is a message indicating a system error.
 - **info**—Information level tracing. An information-level tracing message is a non-urgent message providing information about the system.
 - **noise**—Noise level tracing. The noise level is always equal to the highest tracing level possible and always generates every possible tracing message.
The noise level is always equal to the highest-level tracing message possible for a module, even if future enhancements to this command introduce options that allow users to set higher tracing levels.
 - **notice**—The message is regarding a significant issue, but the switch is still working normally.
 - **verbose**—Verbose level tracing. All possible tracing messages are sent when the trace level is set to verbose.
 - **warning**—Warning messages.
-

Command Default The default tracing level for all modules is **notice**.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.2 | This command was introduced. |

Usage Guidelines The *module* options vary by process and by *hardware-module*. Use the ? option when entering this command to see which *module* options are available with each keyword sequence.

Trace files are stored in the tracelogs directory in the harddisk: file system. These files can be deleted without doing any harm to your switch operation.

Trace file output is used for debugging. The trace level is a setting that determines how much information should be stored in trace files about a module.

Examples This example shows how to set the trace level for all the modules in dbm process:

```
# set platform software trace dbm R0 all-modules debug
```

show platform software trace level

To view the trace levels for all the modules under a specific process, use the **show platform software trace level** command in privileged EXEC or user EXEC mode.

show platform software trace level *process slot*

Syntax Description

process

Process whose tracing level is being set. Options include:

- **chassis-manager**—The Chassis Manager process.
 - **cli-agent**—The CLI Agent process.
 - **cmm**—The CMM process.
 - **dbm**—The Database Manager process.
 - **emd**—The Environmental Monitoring process.
 - **fed**—The Forwarding Engine Driver process.
 - **forwarding-manager**—The Forwarding Manager process.
 - **geo**—The Geo Manager process.
 - **host-manager**—The Host Manager process.
 - **interface-manager**—The Interface Manager process.
 - **iomd**—The Input/Output Module daemon (IOMd) process.
 - **ios**—The IOS process.
 - **license-manager**—The License Manager process.
 - **logger**—The Logging Manager process.
 - **platform-mgr**—The Platform Manager process.
 - **pluggable-services**—The Pluggable Services process.
 - **replication-mgr**—The Replication Manager process.
 - **shell-manager**—The Shell Manager process.
 - **sif**—The Stack Interface (SIF) Manager process.
 - **smd**—The Session Manager process.
 - **stack-mgr**—The Stack Manager process.
 - **table-manager**—The Table Manager Server.
 - **thread-test**—The Multithread Manager process.
 - **virt-manager**—The Virtualization Manager process.
 - **wireless**—The wireless controller module process.
-

| | |
|-------------|---|
| <i>slot</i> | <p>Hardware slot where the process for which the trace level is set, is running. Options include:</p> <ul style="list-style-type: none"> • <i>number</i>—Number of the SIP slot of the hardware module where the trace level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2. • <i>SIP-slot / SPA-bay</i>—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2. • F0—The Embedded Service Processor in slot 0. • F1—The Embedded Service Processor in slot 1. • FP active—The active Embedded Service Processor. • R0—The route processor in slot 0. • RP active—The active route processor. • switch <number> —The switch, with its number specified. • switch active—The active switch. • switch standby—The standby switch. <ul style="list-style-type: none"> • <i>number</i>—Number of the SIP slot of the hardware module where the trace level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2. • <i>SIP-slot / SPA-bay</i>—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2. • F0—The Embedded Service Processor in slot 0. • FP active—The active Embedded Service Processor. • R0—The route processor in slot 0. • RP active—The active route processor. |

request platform software trace archive

To archive all the trace logs relevant to all the processes running on a system since the last reload on the switch and to save this in the specified location, use the **request platform software trace archive** command in privileged EXEC or user EXEC mode.

request platform software trace archive [**last** *number-of-days* [**days** [**target** *location*]] | **target** *location*]

| Syntax Description | | |
|-----------------------------------|--|---|
| last <i>number-of-days</i> | | Specifies the number of days for which the trace files have to be archived. |
| target <i>location</i> | | Specifies the location and name of the archive file. |

| Command Modes | |
|---------------|---------------------|
| | User EXEC (>) |
| | Privileged EXEC (#) |

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.2 | This command was introduced. |

Usage Guidelines This archive file can be copied from the system, using the tftp or scp commands.

Examples This example shows how to archive all the trace logs of the processes running on the switch since the last 5 days:

```
# request platform software trace archive last 5 days target flash:test_archive
```

show platform software btrace-manager

To display the most recent UTF/UTM information for a specific module, use the **show platform software btrace-manager** command in privileged EXEC or user EXEC mode.

show platform software trace filter-binary *filter* [**status** *UTF* *UTM*]

| Syntax Description | filter | Shows the UTF binary stream filter. |
|--------------------|--------|--|
| | status | Shows the status of the binary trace manager filter. |
| | UTF | Shows the UTF unified trace file. |
| | UTM | Shows the UTM trace encoder. |

| Command Modes | User EXEC (>) Privileged EXEC (#) |
|---------------|--------------------------------------|
|---------------|--------------------------------------|

| Command History | Release | Modification |
|-----------------|------------------------------|------------------------------|
| | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

Examples

```
Device# show platform software btrace-manager R0 utf
Estimated disk usage for UTF storage (mbytes):.....61
Disk UTF quota set from: default
Stored preserved UTF time window (current boot):
 [2023/03/17 08:40:00.419987197] - [2023/03/17 20:16:59.895805251]
Stored non-preserved UTF time window (current boot): none
Disk usage for UTF storage (mbytes):.....23
Maximum number of files to retain:.....27
Number of retained UTF files:.....18
Maximum inflated UTF file size (mbytes):.....20
Maximum number of files to preserve:.....2
Number of preserved UTF files:.....2
Stale messages from stream:.....0
Compressed file write failures (disk full):.....0
```

```
Device# show platform software btrace-manager R0 UTM brief
Current Time ..... Fri Mar 17 20:55:25 2023
Unified Consolidated Mode ..... FALSE
Process [Main-ID / Demux-ID / FRU ] ... [6382 / 17304 / RP-FRU]
Number of Processes ..... 79
Number of Active trace files ..... 61
Message Rate/Sec [Current/Average/Peak]. 20 / 11 / 10356
Total Messages ..... 311406
```

set logging

To display the time zone for logging operations, use the **set logging** command in privileged EXEC or user EXEC mode.

```
set logging { backtrace process | marker string | ra { collect } | timezone { UTC | local } |
tracelog-number process | tracelog-files-to-preserve number | tracelog-storage-quota size }
```

Syntax Description

| | |
|-----------------------------------|--|
| <i>backtrace</i> | Displays the backtrace details of a specific process. |
| <i>marker</i> | Selects the logs corresponding to the specified marker: <ul style="list-style-type: none"> • start last marker— The latest matching marker in the marker list. • end marker— The first matching marker after the start marker. |
| <i>timezone</i> | Sets the time zone to be displayed in trace logs. The time zone set by using the set logging command is displayed for the trace logs of show logging and monitor logging commands. If the time zone is not set for a device, then the trace logss appear in Cordinated Universal Time (UTC). |
| ra | Sets the RA attributes. |
| <i>tracelog-number</i> | Sets the tracelog number of a specific process. |
| <i>tracelog-files-to-preserve</i> | Set amount of files to preserve from rotation |
| <i>tracelog-storage-quota</i> | Set Tracelog files to preserve |

Command Modes

User EXEC (>)
Privileged EXEC (#)

Command History

| Release | Modification |
|--------------------------|------------------------------|
| Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Usage Guidelines

In scenarios where the time zone has already been set and the trace logs need to be dispalyed in UTC, use the command **set logging timezone UTC** and the trace logs will appear in UTC. Note that using this command, you can only configure how you want to see the timestamp for trace logs. The timestamps within the trace file is not modified.

This example shows the trace logs when the time zone is set to **UTC**.

```
device_2_9222#show clock *06:14:29.031 IST Fri Oct 4 2019

device_2_9222#show logging process ios
Displaying logs from the last 0 days, 0 hours, 5 minutes, 13 seconds
executing cmd on chassis 1 ...
Collecting files on current[1] chassis.
# of files collected = 15
2019/10/04 06:12:38.051848 {IOSRP_R0-0}{1}: [iosrp] [6107]: (info): *Oct 4 00:42:37.992:
%VUDI-6-EVENT:
[serial number: 9SQTGKYU119], [vUDI: ], vUDI is successfully retrieved from license file

device_2_9222#set logging timezone UTC

device_2_9222#show logging process ios
Displaying logs from the last 0 days, 0 hours, 5 minutes, 40 seconds
executing cmd on chassis 1 ...
Collecting files on current[1] chassis.
# of files collected = 15
2019/10/04 00:42:38.051848 {IOSRP_R0-0}{1}: [iosrp] [6107]: (info): *Oct 4 00:42:37.992:
%VUDI-6-EVENT:
[serial number: 9SQTGKYU119], [vUDI: ], vUDI is successfully retrieved from license file
```

This example shows the trace logs when the time zone is set to **local**.

```
device_2_9222#set logging timezone local

device_2_9222#show logging process ios
Displaying logs from the last 0 days, 0 hours, 7 minutes, 32 seconds
executing cmd on chassis 1 ...
Collecting files on current[1] chassis.
# of files collected = 12
2019/10/04 06:12:38.051848 {IOSRP_R0-0}{1}: [iosrp] [6107]: (info): *Oct 4 00:42:37.992:
%VUDI-6-EVENT: [serial number: 9SQTGKYU119], [vUDI: ], vUDI is successfully retrieved from
license file
```

set logging marker

To add a marker trace to all the processes, use the **set logging marker** command. Use the **show logging markers** command to see the markers that were set using the **set logging marker** along with the timestamp.

set logging marker *marker-name*

| Syntax Description | | |
|--------------------|--------------------|--|
| | <i>marker-name</i> | Sets the marker trace in the trace logs of a process. The marker string entered is not case sensitive. |

| Command Modes | |
|---------------|---------------------|
| | User EXEC (>) |
| | Privileged EXEC (#) |

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

This example show how to set a logging marker.

```
Device# set logging marker global_100
```

```
Device# show logging markers
```

```
Timestamp UTC          Marker
-----
2023/03/13 10:31:34.667836  global_100
```

show logging

To display the state of system logging (syslog) and the contents of the standard system logging buffer, use the **show logging** command in privileged EXEC or user EXEC mode.

show logging

Syntax Description This command has no arguments or keywords.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Examples

This example shows the output of the **show logging** command:

```
device# show logging
Syslog logging: enabled (0 messages dropped, 2 messages rate-limited, 0 flushes, 0 overruns,
  xml disabled, filtering disabled)
No Active Message Discriminator.

No Inactive Message Discriminator.

  Console logging: level debugging, 67 messages logged, xml disabled,

show logging process

To view messages logged by binary trace for a process or processes, use the **show logging process** command in privileged EXEC or user EXEC mode.

show logging process *process-name*

| Syntax Description | <i>process-name</i> | You can choose a certain process for which the logs need to be displayed. Example: dbm , sman , ios , btman and so on. The process name is not case sensitive. | | | | |
|---------------------------|--|--|--------------|--------------------------|------------------------------|--|
| Command Default | The default tracing level for all modules is notice . | | | | | |
| Command Modes | User EXEC (>) Privileged EXEC (#) | | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Fuji 16.9.x</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Fuji 16.9.x | This command was introduced. | |
| Release | Modification | | | | | |
| Cisco IOS XE Fuji 16.9.x | This command was introduced. | | | | | |

This example shows how to display the logs below the **notice** level.

```

show logging process-helper

To display the logs for a specific process, use the **show logging process-helper** command in privileged EXEC or user EXEC mode.

show logging process-helper *process-name*

| | | |
|---------------------------|---------------------|--|
| Syntax Description | <i>process-name</i> | You can choose a certain process for which the logs need to be displayed. Example: bt-logger , btrace-manager , ios , dbm , logger , and so on. |
|---------------------------|---------------------|--|

| | |
|------------------------|--|
| Command Default | The default tracing level for all modules is notice . |
|------------------------|--|

| | |
|----------------------|--------------------------------------|
| Command Modes | User EXEC (>) Privileged EXEC (#) |
|----------------------|--------------------------------------|

| Command History | Release | Modification |
|------------------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

The following example shows how to display logs for a specific process.

```
Device# show logging process-helper ios
Logging display requested on 2023/03/13 10:30:29 (UTC) for Hostname: [FABRIEK], Model:

show logging profile

To display the logs for a specific profile, use the **show logging profile** command in privileged EXEC or user EXEC mode.

show logging profile *profile-name*

Syntax Description

profile-name

- **all**: Displays the logs for all processes.
- **file**: Displays the logs for a specific profile file.
- **hardware-diagnostics**: Displays the logs for the hardware-diagnostics specific processes
- **install**: Displays the logs for Install-specific processes.
- **netconf-yang**: Displays the logs for netconf-yang specific processes.
- **restconf**: Displays the logs for restconf-specific processes.
- **sdwan**: Displays the logs for SDWAN-specific processes.
- **wireless**: Displays the logs for Wireless-specific processes.

Command Default

None

Command Modes

User EXEC (>)

Privileged EXEC (#)

show logging profile wireless

To display the logs for a specific profile, use the **show logging profile wireless** command in privileged EXEC or user EXEC mode.

show logging profile wireless

Syntax Description

This command has no keywords or arguments.

Command Default

None.

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

| Release | Modification |
|------------------------------|------------------------------|
| Cisco IOS XE Everest 16.5.1a | This command was introduced. |

Usage Guidelines

Ensure that you enable internal keyword using the **show logging profile wireless internal** command to get the trace output.

Without the **internal** keyword, only customer curated logs are displayed.

The following example shows how to display logs for the wireless profile.

```
Device# show logging profile wireless
Logging display requested on 2023/03/13 09:07:09 (UTC) for Hostname: [FABRIEK], Model:
[C8300-1N1S-4T2X], Version: [17.12.01], SN: [FDO24190V85], MD_SN: [FDO2451M13G]

Displaying logs from the last 0 days, 0 hours, 10 minutes, 0 seconds
executing cmd on chassis local ...
Unified Decoder Library Init .. DONE
Found 1 UTF Streams

show logging profile wireless end

To specify log filtering end location timestamp for filtering, use the **show logging profile wireless end timestamp** command.

show logging profile wireless end timestamp *time-stamp*
show logging profile wireless end timestamp time-stamp

| | | |
|---------------------------|-------------------|---|
| Syntax Description | <i>time-stamp</i> | The timestamp to end the filtering. For example, 2023/02/10 14:41:50.849. |
|---------------------------|-------------------|---|

| | |
|------------------------|-------|
| Command Default | None. |
|------------------------|-------|

| | |
|----------------------|--------------------------------------|
| Command Modes | User EXEC (>) Privileged EXEC (#) |
|----------------------|--------------------------------------|

| | | |
|------------------------|--------------------------|------------------------------|
| Command History | Release | Modification |
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | Ensure that you enable internal keyword using the show logging profile wireless internal command to get the trace output. |
|-------------------------|--|

Without the **internal** keyword, only customer curated logs are displayed.

Examples

The following example shows how to specify log filtering start/end location timestamp for filtering:

```
Device# show logging profile wireless internal start timestamp "2018/07/16 23:09:52.541"
end timestamp "2018/07/16 23:19:52.671" to-file test
```

```
excuting cmd on chassis 1 ...
Files being merged in the background, result will be in /bootflash/test log file.
Collecting files on current[1] chassis.
Decoding files:
btrace decoder:          number of files: [48]   number of messages: [5736]
    2018-07-16 23:23:51.451 - btrace decoder processed 17%
    2018-07-16 23:23:51.585 - btrace decoder processed 34%
    2018-07-16 23:23:51.832 - btrace decoder processed 52%
    2018-07-16 23:23:52.108 - btrace decoder processed 69%
    2018-07-16 23:23:52.138 - btrace decoder processed 87%
    2018-07-16 23:23:52.222 - btrace decoder processed 98%
```

show logging profile wireless filter

To specify filter for logs, use the **show logging profile wireless filter** command.

\

show logging profile wireless filter { **interface** | **ipv4** | **ipv6** | **mac** | **ra** | **string** | **uuid** }

| Syntax Description | | |
|--------------------|------------------|--|
| | interface | Selects logs with specific interface app context. |
| | ipv4 | Selects logs with specific IPv4 address app context. |
| | ipv6 | Selects logs with specific IPv6 address app context. |
| | mac | Selects logs with specific MAC app context. |
| | string | Selects logs with specific string app context. |
| | uuid | Selects logs with specific Universally Unique Identifier (UUID) app context. |
| | ra | Selects the radioactive logs. |

Command Default None

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|------------------------------|------------------------------|
| | Cisco IOS XE Everest 16.5.1a | This command was introduced. |

Usage Guidelines Ensure that you enable internal keyword using the **show logging profile wireless internal** command to get the trace output.

Without the **internal** keyword, only customer curated logs are displayed.

The following example shows how to specify filter for logs:

```
Device# show logging profile wireless filter mac ECE1.A9DA.0CEO
executing cmd on chassis 1 ...
Collecting files on current[1] chassis.
Total # of files collected = 28
Decoding files:

```

show logging profile wireless fru

To specify field-replaceable unit (FRU) specific commands, use the **show logging profile wireless fru** command.

show logging profile wireless fru

| Syntax Description | 0 | SM-Inter-Processor slot 0 |
|--------------------|----|-----------------------------------|
| | 1 | SM-Inter-Processor slot 1 |
| | F0 | Embedded-Service-Processor slot 0 |
| | FP | Embedded-Service-Processor |
| | R0 | Route-Processor slot 0 |
| | RP | Route-Processor |

Command Default None.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Usage Guidelines Ensure that you enable internal keyword using the **show logging profile wireless internal** command to get the trace output.

Without the **internal** keyword, only customer curated logs are displayed.

Examples

The following example shows how to specify FRU specific commands:

```
Device# show logging profile wireless fru switch standby R0
Logging display requested on 2023/03/13 07:39:11 (UTC) for Hostname: [BRU-C9K-153-05],

```

show logging profile wireless level

To select logs above a specific level, use the **show logging profile wireless level** command.

show logging profile wireless level { **debug** | **error** | **info** | **notice** | **verbose** | **warning** }

| Syntax Description | | |
|--------------------|--|---|
| debug | | Selects the debug-level trace messages. |
| error | | Selects the error-level trace messages. |
| info | | Selects the informational-level trace messages. |
| notice | | Selects the notice-level trace messages. |
| verbose | | Selects the verbose-level trace messages. |
| warning | | Selects the warning-level trace messages. |

Command Default The default tracing level for all modules is **notice**.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Usage Guidelines

- Ensure that you enable internal keyword using the **show logging profile wireless internal** command to get the trace output. Without the **internal** keyword, only customer curated logs are displayed.
- Trace level determines the types of traces outputted. Each trace message is assigned a trace level. If the trace level of a process or its module is set at a greater than or equal to level as the trace message, the trace message is displayed otherwise, it is skipped. For example, the default trace level is **Notice** level, so all traces with the **Notice** level and below the **Notice** level are included while the traces above the **Notice** level are excluded.

Examples

The following example shows how to select logs above a specific level:

```
Device# show logging profile wireless level notice
Logging display requested on 2023/03/13 08:00:47 (UTC) for Hostname: [BRU-C9K-153-05],
Model: [C9300-24T], Version: [17.03.05], SN: [FOC24140R40], MD_SN: [FOC2415U0XX]

Displaying logs from the last 0 days, 0 hours, 10 minutes, 0 seconds
executing cmd on chassis 1 ...

```

show logging profile wireless module

To select logs for specific modules, use the **show logging profile wireless module** command.

show logging profile wireless module *module-name*

| | | |
|---------------------------|--------------------------------------|---|
| Syntax Description | <i>module-name</i> | List the module names separated by commas or space. For example, dbal, tdllib or "dbal tdllib". |
| Command Default | None. | |
| Command Modes | User EXEC (>) Privileged EXEC (#) | |
| Command History | Release | Modification |
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Usage Guidelines Ensure that you enable internal keyword using the **show logging profile wireless internal** command to get the trace output.

Without the **internal** keyword, only customer curated logs are displayed.

The following example shows how to select logs for specific modules:

```
Device# show logging profile wireless module dbal
Logging display requested on 2023/03/13 08:53:08 (UTC) for Hostname: [FABRIEK], Model:

show logging profile wireless start

To specify log filtering start location, use the **show logging profile wireless start** command.

```
show logging profile wireless start { last | marker | timestamp }
```

| Syntax Description | last | Display the logs since last event. |
|--------------------|------------------|--|
| | marker | The marker to start filtering from. It must match with previously set marker |
| | timestamp | The timestamp for filtering. for example, "2023/02/10 14:41:50.849". |

Command Default None.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Usage Guidelines Ensure that you enable internal keyword using the **show logging profile wireless internal** command to get the trace output.

Without the **internal** keyword, only customer curated logs are displayed.

Examples

The following example shows how to specify log filtering from a specific marker:

```

show logging profile wireless switch

To specify the switch to look for logs, use the **show logging profile wireless switch** command.

show logging profile wireless switch { <switch-number> | **active** | **standby** }

| Syntax Description | | |
|--------------------|-----------------------|-------------------------------|
| | <i>Chassis-number</i> | The chassis number. |
| | active | Selects the active instance. |
| | standby | Selects the standby instance. |

Command Default None.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Usage Guidelines Ensure that you enable internal keyword using the **show logging profile wireless internal** command to get the trace output.

Without the **internal** keyword, only customer curated logs are displayed.

Examples

The following example shows how to specify the chassis number to look for logs:

```
Device# show logging profile wireless switch 1
Logging display requested on 2023/03/13 08:31:03 (UTC) for Hostname: [BRU-C9K-153-05],
Model: [C9300-24T], Version: [17.03.05], SN: [FOC24140R40], MD_SN: [FOC2415U0XX]

Displaying logs from the last 0 days, 0 hours, 10 minutes, 0 seconds
executing cmd on chassis 1 ...

show logging profile wireless to-file

To decode files stored in disk and write the output to a file, use the **show logging profile wireless to-file** command.

show logging profile wireless to-file *output-file-name*

| | | |
|---------------------------|-------------------------|---|
| Syntax Description | <i>output-file-name</i> | Output file name. File with this name will be created in the flash/bootflash/crashinfo/harddisk memory. |
|---------------------------|-------------------------|---|

| | |
|------------------------|-------|
| Command Default | None. |
|------------------------|-------|

| | |
|----------------------|--------------------------------------|
| Command Modes | User EXEC (>) Privileged EXEC (#) |
|----------------------|--------------------------------------|

| Command History | Release | Modification |
|------------------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

| | |
|-------------------------|--|
| Usage Guidelines | Ensure that you enable internal keyword using the show logging profile wireless internal command to get the trace output. |
|-------------------------|--|

Without the **internal** keyword, only customer curated logs are displayed.

Examples

The following example shows how to decode files stored in disk and write the output to a file:

```
Device# show logging profile wireless to-file mylog.txt
excuting cmd on chassis 1 ...
Files being merged in the background, result will be in /bootflash/mylog.txt log file.

Device#
Device#dir bootflash:mylog.txt
Directory of bootflash:/mylog.txt

   39  -rw-           1698598  Oct 31 2017 05:29:11 +00:00  mylog.txt

7897796608 bytes total (3338383360 bytes free)
```

show logging profile sdwan

To view messages logged by binary trace for Cisco-SD-WAN-specific processes and process modules, use the **show logging profile sdwan** command in the privileged EXEC mode. The messages are displayed in chronological order.

show logging profile sdwan

```
[{ extract-pcap to-file path | [ end timestamp ts ] [ module name ] [ internal ] [ start { last { n { days | hours | minutes | seconds } clear boot } | timestamp ts } [ end { last { n { days | hours | minutes | seconds } clear boot } | timestamp ts } ] ] [ level level ] [ fru slot ] [{ reverse | [ trace-on-failure | metadata } ] [ to-file path ] } ] }
```

| Syntax Description | | |
|---|--|---|
| extract-pcap to-file <i>path</i> | | Extracts pcap data to a file. |
| end timestamp <i>ts</i> | | Shows logs up to the specified timestamp. |
| module <i>name</i> | | Selects logs for specific modules. |
| internal | | Selects all logs. |
| start { last { <i>n</i> { days hours minutes seconds } clear boot } timestamp <i>ts</i> } [end { last { <i>n</i> { days hours minutes seconds } clear boot } timestamp <i>ts</i> }] | | Shows logs collected between the specified start and end times. |
| level <i>level</i> | | Shows logs for the specified and higher levels. |
| fru <i>slot</i> | | Shows logs from a specific FRU. |
| reverse | | Shows logs in reverse chronological order. |
| to-file <i>path</i> | | Decodes files stored in disk and writes output to file. |
| trace-on-failure | | Shows the trace on failure summary. |
| metadata | | Shows metadata for every log message. |

Command Default None

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|------------------------------|---|
| | Cisco IOS XE Release 17.4.1a | Command support introduced for select Cisco SD-WAN processes. |

Usage Guidelines

Table 222: Supported Cisco SD-WAN Daemons

| Cisco SD-WAN Daemons | Supported from Release |
|--|------------------------------|
| <ul style="list-style-type: none"> • fpmd • ftm • ompd • vdaemon • cfgmgr | Cisco IOS XE Release 17.4.1a |

Example

The following example shows a truncated output of the **show logging profile sdwan start last boot internal** command. From the timestamps, we can see that the messages are shown in a chronological order.

```
Device# show logging profile sdwan start last boot internal
Logging display requested on 2020/11/18 18:59:16 (UTC) for Hostname: [Device], Model:

show logging profile sdwan internal

To view messages logged by binary trace for Cisco-SD-WAN-specific processes and process modules, use the **show logging profile sdwan internal** command in the privileged EXEC mode. The messages are displayed in chronological order.

show logging profile sdwan internal

| Syntax Description | end timestamp <i>ts</i> | Shows logs up to the specified timestamp. |
|------------------------|--|---|
| | start { last { <i>n</i> { days hours minutes seconds } clear boot } timestamp <i>ts</i> } [end { last { <i>n</i> { days hours minutes seconds } clear boot } timestamp <i>ts</i> }] | Shows logs collected between the specified start and end times. |
| | level <i>level</i> | Shows logs for the specified and higher levels. |
| | fru <i>slot</i> | Shows logs from a specific FRU. |
| | reverse | Shows logs in reverse chronological order. |
| | to-file <i>path</i> | Decodes files stored in disk and writes output to file. |
| | trace-on-failure | Shows the trace on failure summary. |
| | metadata | Shows metadata for every log message. |
| Command Default | None | |
| Command Modes | Privileged EXEC | |
| Command History | Release | Modification |
| | Cisco IOS XE Release 17.4.1a | Command support introduced for select Cisco SD-WAN processes. |

Usage Guidelines

Table 223: Supported Cisco SD-WAN Daemons

| Cisco SD-WAN Daemons | Supported from Release |
|--|------------------------------|
| <ul style="list-style-type: none"> • fpmd • ftm • ompd • vdaemon • cfgmgr | Cisco IOS XE Release 17.4.1a |

Example

```

Device# show logging profile sdwan internal start last boot

show log file

To display the log files in bootflash:, crashinfo:, flash:, harddisk:, or webui:, use the **show log file** command.

show log file

Syntax Description This command has no arguments or keywords.

Command Default None.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Examples

This example shows how to display binary encoded logs on the /harddisk/tracelogs directory:

```
# show log file flash:tracelogs/wncmgrd_R0-0.31953_1984.20171030025730.bin
```

```
excuting cmd on chassis 1 ...
Decoding files:
```

```
2017/10/30 02:57:30.189 {wncmgrd_R0-0}{1}: [hl-core] [31953]: UUID: 1000000042b94, ra: 15,
(debug): AP ecel.a9da.0ce0 is detected as unknown and is ignored for L1
2017/10/30 02:57:30.190 {wncmgrd_R0-0}{1}: [hl-core] [31953]: UUID: 1000000042b95, ra: 15,
(debug): AP ecel.a9da.0ce0 is detected as unknown and is ignored for L1
2017/10/30 02:57:30.655 {wncmgrd_R0-0}{1}: [capwapac-srvr] [31953]: UUID: 1000000042b9d,

ra: 15,
```

monitor logging

To monitor log generation in real-time for a process or a profile, use the **monitor logging** command in privileged EXEC or user EXEC mode.

monitor logging

Syntax Description This command has no arguments or keywords.

Command Default None.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Examples

This example shows how to monitor logs for a device:

```
Device# monitor logging
Displaying traces starting from 2023/03/13 13:54:44.000000. If no traces are present, the
command will wait until one is.

```

monitor logging filter

To specify filter for monitorin logs, use the **monitor logging** command.

```
monitor logging filter { interface | ipv4 | ipv6 | mac | ra | string | uuid }
```

| Syntax Description | | |
|--------------------|------------------|--|
| | interface | Selects logs with specific interface app context. |
| | ipv4 | Selects logs with specific IPv4 address app context. |
| | ipv6 | Selects logs with specific IPv6 address app context. |
| | mac | Selects logs with specific MAC app context. |
| | string | Selects logs with specific string app context. |
| | uuid | Selects logs with specific Universally Unique Identifier (UUID) app context. |
| | ra | Selects the radioactive logs. |

Command Default None.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Examples

The following example show how to specify filter for monitoring logs.

```
Device# monitor logging filter mac ECE1.A9DA.0CE0
```

```
Device# monitor logging filter uuid 0x1f00000000014
```

monitor logging level

To monitor logs above a specific level, use the **monitor logging level** command.

monitor logging level { **debug** | **error** | **info** | **notice** | **verbose** | **warning** }

| Syntax Description | | |
|--------------------|--|---|
| debug | | Selects the debug-level trace messages. |
| error | | Selects the error-level trace messages. |
| info | | Selects the informational-level trace messages. |
| notice | | Selects the notice-level trace messages. |
| verbose | | Selects the verbose-level trace messages. |
| warning | | Selects the warning-level trace messages. |

Command Default The default tracing level for all modules is **notice**.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Examples

The following example shows how to monitor logs above a specific level.

```
Device# monitor logging level debug
```

monitor logging metadata

To display metadata for every log message, use the **monitor logging metadata** command.

monitor logging metadata

Syntax Description This command has no arguments or keywords.

Command Default None.

Command Modes User EXEC (>)
Privileged EXEC (#)

| Command History | Release | Modification |
|-----------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

The following example show how to view the metadata of a log message.

```
#monitor logging metadata
Displaying traces starting from 2023/03/13 16:14:38.000000. If no traces are present, the
command will wait until one is.
Unified Decoder Library Init .. DONE

monitor logging process-helper

To monitor log generation in real-time for a process or a profile, use the **monitor logging** command in privileged EXEC or user EXEC mode.

monitor logging process-helper process-name

| | | |
|---------------------------|---------------------|--|
| Syntax Description | <i>process-name</i> | You can choose a certain process for which the logs need to be monitored. Example: bt-logger , btrace-manager , ios , dbm , logger , and so on. |
|---------------------------|---------------------|--|

| | |
|------------------------|-------|
| Command Default | None. |
|------------------------|-------|

| | |
|----------------------|--------------------------------------|
| Command Modes | User EXEC (>) Privileged EXEC (#) |
|----------------------|--------------------------------------|

| Command History | Release | Modification |
|------------------------|--------------------------|------------------------------|
| | Cisco IOS XE Fuji 16.9.x | This command was introduced. |

Examples

The following example shows how to monitor logs for a specific process.

```
Device# monitor logging process-helper ios
Displaying traces starting from 2023/03/13 16:38:08.000000. If no traces are present, the
command will wait until one is.
Unified Decoder Library Init .. DONE
Found 1 UTF Streams

2023/03/13 16:38:13.126431871 {iosrp_R0-0}{255}: [parser_cmd] [3793]: (note): id=
10.68.219.145@vty0:user= cmd: 'enable' SUCCESS 2023/03/13 16:38:09.727 UTC
```

monitor logging

To monitor logs for a profile, use the **monitor logging** command.

monitor logging profile *profile-name*

Syntax Description

profile

- **all**: Displays the logs for all processes.
- **file**: Displays the logs for a specific profile file (bootflash:, crashinfo:, flash:, harddisk:, or webui:).
- **hardware-diagnostics**: Displays the logs for the hardware-diagnostics specific processes
- **install**: Displays the logs for Install-specific processes.
- **netconf-yang**: Displays the logs for netconf-yang specific processes.
- **restconf**: Displays the logs for restconf-specific processes.
- **sdwan**: Displays the logs for SDWAN-specific processes.
- **wireless**: Displays the logs for Wireless-specific processes.

Command Default

None.

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

clear vtp counters

To clear the VLAN Trunking Protocol (VTP) and pruning counters, use the **clear vtp counters** command in privileged EXEC mode.

clear vtp counters

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

This example shows how to clear the VTP counters:

```
Device> enable
Device# clear vtp counters
```

You can verify that information was deleted by entering the **show vtp counters** privileged EXEC command.

debug sw-vlan

To enable debugging of VLAN manager activities, use the **debug sw-vlan** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug sw-vlan {**badpmcookies** | **cfg-vlan** {**bootup** | **cli**} | **events** | **ifs** | **mapping** | **notification** | **packets** | **redundancy** | **registries** | **vtp**}
no debug sw-vlan {**badpmcookies** | **cfg-vlan** {**bootup** | **cli**} | **events** | **ifs** | **mapping** | **notification** | **packets** | **redundancy** | **registries** | **vtp**}

Syntax Description

| | |
|---------------------|---|
| badpmcookies | Displays debug messages for VLAN manager incidents of bad port manager cookies. |
| cfg-vlan | Displays VLAN configuration debug messages. |
| bootup | Displays messages when the switch is booting up. |
| cli | Displays messages when the command-line interface (CLI) is in VLAN configuration mode. |
| events | Displays debug messages for VLAN manager events. |
| ifs | Displays debug messages for the VLAN manager IOS file system (IFS). See debug sw-vlan ifs, on page 2345 for more information. |
| mapping | Displays debug messages for VLAN mapping. |
| notification | Displays debug messages for VLAN manager notifications. See debug sw-vlan notification, on page 2346 for more information. |
| packets | Displays debug messages for packet handling and encapsulation processes. |
| redundancy | Displays debug messages for VTP VLAN redundancy. |
| registries | Displays debug messages for VLAN manager registries. |
| vtp | Displays debug messages for the VLAN Trunking Protocol (VTP) code. See debug sw-vlan vtp, on page 2347 for more information. |

Command Default

Debugging is disabled.

Command Modes

Privileged EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The **undebug sw-vlan** command is the same as the **no debug sw-vlan** command.

Examples

This example shows how to display debug messages for VLAN manager events:

```
Device> enable
Device# debug sw-vlan events
```

debug sw-vlan ifs

To enable debugging of the VLAN manager IOS file system (IFS) error tests, use the **debug sw-vlan ifs** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
no debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
```

| Syntax Description | open read | Displays VLAN manager IFS file-read operation debug messages. |
|--------------------|------------|--|
| | open write | Displays VLAN manager IFS file-write operation debug messages. |
| | read | Displays file-read operation debug messages for the specified error test (1 , 2 , 3 , or 4). |
| | write | Displays file-write operation debug messages. |

Command Default Debugging is disabled.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **undebug sw-vlan ifs** command is the same as the **no debug sw-vlan ifs** command.

When selecting the file read operation, Operation **1** reads the file header, which contains the header verification word and the file version number. Operation **2** reads the main body of the file, which contains most of the domain and VLAN information. Operation **3** reads type length version (TLV) descriptor structures. Operation **4** reads TLV data.

Examples This example shows how to display file-write operation debug messages:

```
Device> enable
Device# debug sw-vlan ifs write
```

debug sw-vlan notification

To enable debugging of VLAN manager notifications, use the **debug sw-vlan notification** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug sw-vlan notification {accfwdchange | allowedvlanfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange}
no debug sw-vlan notification {accfwdchange | allowedvlanfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange}
```

| Syntax Description | | |
|----------------------------|---|--|
| accfwdchange | Displays debug messages for VLAN manager notification of aggregated access interface spanning-tree forward changes. | |
| allowedvlanfgchange | Displays debug messages for VLAN manager notification of changes to the allowed VLAN configuration. | |
| fwdchange | Displays debug messages for VLAN manager notification of spanning-tree forwarding changes. | |
| linkchange | Displays debug messages for VLAN manager notification of interface link-state changes. | |
| modechange | Displays debug messages for VLAN manager notification of interface mode changes. | |
| pruningcfgchange | Displays debug messages for VLAN manager notification of changes to the pruning configuration. | |
| statechange | Displays debug messages for VLAN manager notification of interface state changes. | |

Command Default Debugging is disabled.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **undebug sw-vlan notification** command is the same as the **no debug sw-vlan notification** command.

Examples

This example shows how to display debug messages for VLAN manager notification of interface mode changes:

```
Device> enable
Device# debug sw-vlan notification
```

debug sw-vlan vtp

To enable debugging of the VLAN Trunking Protocol (VTP) code, use the **debug sw-vlan vtp** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug sw-vlan vtp {events | packets | pruning [{packets | xmit}] | redundancy | xmit}
no debug sw-vlan vtp {events | packets | pruning | redundancy | xmit}
```

| Syntax Description | | |
|--------------------|-------------------|---|
| | events | Displays debug messages for general-purpose logic flow and detailed VTP messages generated by the VTP_LOG_RUNTIME macro in the VTP code. |
| | packets | Displays debug messages for the contents of all incoming VTP packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer, except for pruning packets. |
| | pruning | Displays debug messages generated by the pruning segment of the VTP code. |
| | packets | (Optional) Displays debug messages for the contents of all incoming VTP pruning packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer. |
| | xmit | (Optional) Displays debug messages for the contents of all outgoing VTP packets that the VTP code requests the Cisco IOS VTP platform-dependent layer to send. |
| | redundancy | Displays debug messages for VTP redundancy. |
| | xmit | Displays debug messages for the contents of all outgoing VTP packets that the VTP code requests the Cisco IOS VTP platform-dependent layer to send, except for pruning packets. |

Command Default Debugging is disabled.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines The **undebug sw-vlan vtp** command is the same as the **no debug sw-vlan vtp** command. If no additional parameters are entered after the **pruning** keyword, VTP pruning debugging messages appear. They are generated by the VTP_PRUNING_LOG_NOTICE, VTP_PRUNING_LOG_INFO, VTP_PRUNING_LOG_DEBUG, VTP_PRUNING_LOG_ALERT, and VTP_PRUNING_LOG_WARNING macros in the VTP pruning code.

Examples This example shows how to display debug messages for VTP redundancy:

```
Device> enable
Device# debug sw-vlan vtp redundancy
```

dot1q vlan native

To assign the native VLAN ID of a physical interface trunking 802.1Q VLAN traffic, use the **dot1q vlan native** command in interface configuration mode. To remove the VLAN ID assignment, use the **no** form of this command.

dot1q vlan *vlan-id* [**native**]
no dot1q vlan *vlan-id* [**native**]

Syntax Description

vlan-id Trunk interface ID. The range is from 1 to 4000.

native Specifies the native VLAN associated with the 802.1Q trunk interface.

Command Default

No default behavior or values

Command Modes

Interface configuration (config-if)

Command History

Release

Modification

Cisco IOS XE Gibraltar 16.10.1

This command was introduced.

Usage Guidelines

To use this command, you must be in a user group associated with a task group that includes proper task IDs. If you suspect that user group assignment is preventing you from using a command, contact your AAA administrator.

The **dot1q vlan native** command defines the default, or native VLAN, associated with an 802.1Q trunk interface. The native VLAN of a trunk interface is the VLAN to which all the untagged VLAN packets are logically assigned.

Note The native VLAN cannot be configured on a subinterface of the trunk interface. The native VLAN must be configured with the same value at both ends of the link, or traffic can be lost or sent to the wrong VLAN.

Examples

The following example shows how to configure the native VLAN of a GigabitEthernet 1/0/33 trunk interface as 1. Packets received on this interface that are untagged, or that have an 802.1Q tag with VLAN ID 1, are received on the main interface. Packets sent from the main interface are transmitted without an 802.1Q tag.

```
Device> enable
Device(config)# interface GigabitEthernet 1/0/33.201
Device(config-subif)# dot1q vlan 1 native
```

interface (VLAN)

To create a VLAN subinterface, use the **interface** command in global configuration mode. To delete a subinterface, use the **no** form of this command.

```
interface {type switch |slot |port.subinterface }
no interface {type switch |slot |port.subinterface }
```

| | | |
|---------------------------|---|---|
| Syntax Description | <i>type</i> | Type of interface to be configured. |
| | <i>switch/slot/port.subinterface</i> | Physical interfaces or virtual interfaces followed by the subinterface path ID. |
| Command Default | No default behavior or values | |
| Command Modes | Global configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Gibraltar 16.10.1 | This command was introduced. |
| Usage Guidelines | To use this command, you must be in a user group associated with a task group that includes the proper task IDs. If you suspect user group assignment is preventing you from using a command, contact your AAA administrator. | |
| | To configure a large number of subinterfaces, we recommend entering all configuration data before you commit the interface command. | |
| | To change an interface from Layer 2 to Layer 3 mode and back, you must delete the interface first and then re-configure it in the appropriate mode. | |

Examples

This example shows how to configure subinterfaces on layer 3 interfaces:

```
Device> enable
Device(config)# interface HundredGigabitEthernet 1/0/33.201
Device(config-subif)# encapsulation dot1q 33 native
```

Related Commands

| Command | Description |
|--------------------------|--|
| dot1q vlan native | Defines the native VLAN ID associated with a subinterface. |

private-vlan

To configure private VLANs and to configure the association between private VLAN primary and secondary VLANs, use the **private-vlan** VLAN configuration command on the switch stack or on a standalone switch. Use the **no** form of this command to return the VLAN to normal VLAN configuration.

```
private-vlan {association [{add | remove}] secondary-vlan-list | community | isolated | primary}
no private-vlan {association | community | isolated | primary}
```

| Syntax | Description |
|----------------------------|---|
| association | Creates an association between the primary VLAN and a secondary VLAN. |
| add | Associates a secondary VLAN to a primary VLAN. |
| remove | Clears the association between a secondary VLAN and a primary VLAN. |
| <i>secondary-vlan-list</i> | One or more secondary VLANs to be associated with a primary VLAN in a private VLAN. |
| community | Designates the VLAN as a community VLAN. |
| isolated | Designates the VLAN as an isolated VLAN. |
| primary | Designates the VLAN as a primary VLAN. |

Command Default The default is to have no private VLANs configured.

Command Modes VLAN configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Before configuring private VLANs, you must disable VTP (VTP mode transparent). After you configure a private VLAN, you should not change the VTP mode to client or server.

VTP does not propagate private VLAN configurations. You must manually configure private VLANs on all switches in the Layer 2 network to merge their Layer 2 databases and to prevent flooding of private VLAN traffic.

You cannot include VLAN 1 or VLANs 1002 to 1005 in the private VLAN configuration. Extended VLANs (VLAN IDs 1006 to 4094) can be configured in private VLANs.

You can associate a secondary (isolated or community) VLAN with only one primary VLAN. A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it.

- A secondary VLAN cannot be configured as a primary VLAN.
- The *secondary-vlan-list* cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.

- If you delete either the primary or secondary VLANs, the ports associated with the VLAN become inactive.

A community VLAN carries traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

An isolated VLAN is used by isolated ports to communicate with promiscuous ports. It does not carry traffic to other community ports or isolated ports with the same primary VLAN domain.

A primary VLAN is the VLAN that carries traffic from a gateway to customer end stations on private ports.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The **private-vlan** commands do not take effect until you exit from VLAN configuration mode.

Do not configure private VLAN ports as EtherChannels. While a port is part of the private VLAN configuration, any EtherChannel configuration for it is inactive.

Do not configure a private VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN.

Do not configure a private VLAN as a voice VLAN.

Do not configure fallback bridging on switches with private VLANs.

Although a private VLAN contains more than one VLAN, only one STP instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

For more information about private VLAN interaction with other features, see the software configuration guide for this release.

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, and to associate them in a private VLAN:

```
# configure terminal
(config)# vlan 20
(config-vlan)# private-vlan primary
(config-vlan)# exit
(config)# vlan 501
(config-vlan)# private-vlan isolated
(config-vlan)# exit
(config)# vlan 502
(config-vlan)# private-vlan community
(config-vlan)# exit
(config)# vlan 503
(config-vlan)# private-vlan community
(config-vlan)# exit
(config)# vlan 20
(config-vlan)# private-vlan association 501-503
(config-vlan)# end
```

You can verify your setting by entering the **show vlan private-vlan** or **show interfaces status privileged EXEC** command.

private-vlan mapping

To create a mapping between the primary and the secondary VLANs so that both VLANs share the same primary VLAN switched virtual interface (SVI), use the **private-vlan mapping** interface configuration command on a switch virtual interface (SVI). Use the **no** form of this command to remove private VLAN mappings from the SVI.

```
private-vlan mapping [{add | remove}] secondary-vlan-list
no private-vlan mapping
```

| | | |
|---------------------------|--|---|
| Syntax Description | add | (Optional) Maps the secondary VLAN to the primary VLAN SVI. |
| | remove | (Optional) Removes the mapping between the secondary VLAN and the primary VLAN SVI. |
| | <i>secondary-vlan-list</i> | One or more secondary VLANs to be mapped to the primary VLAN SVI. |
| Command Default | No private VLAN SVI mapping is configured. | |
| Command Modes | Interface configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The device must be in VTP transparent mode when you configure private VLANs.

The SVI of the primary VLAN is created at Layer 3.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The *secondary-vlan-list* argument cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.

Traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.

A secondary VLAN can be mapped to only one primary SVI. If you configure the primary VLAN as a secondary VLAN, all SVIs specified in this command are brought down.

If you configure a mapping between two VLANs that do not have a valid Layer 2 private VLAN association, the mapping configuration does not take effect.

Examples

This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

```
Device# configure terminal
Device# interface vlan 18
Device(config-if)# private-vlan mapping 20
Device(config-vlan)# end
```

This example shows how to permit routing of secondary VLAN traffic from secondary VLANs 303 to 305 and 307 through VLAN 20 SVI:

```
Device# configure terminal  
Device# interface vlan 20  
Device(config-if)# private-vlan mapping 303-305, 307  
Device(config-vlan)# end
```

You can verify your settings by entering the **show interfaces private-vlan mapping** privileged EXEC command.

show interfaces private-vlan mapping

To display private VLAN mapping information for the VLAN switch virtual interfaces (SVIs), use the **show interfaces private-vlan mapping** command in user EXEC or privileged EXEC mode.

show interfaces [*interface-id*] **private-vlan mapping**

| | | |
|---------------------------|---|------------------------------|
| Syntax Description | <i>interface-id</i> (Optional) ID of the interface for which to display private VLAN mapping information. | |
| Command Default | None | |
| Command Modes | User EXEC Privileged EXEC | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Examples

This example shows how to display the information about the private VLAN mapping:

```
Device#show interfaces private-vlan mapping
Interface Secondary VLAN Type
-----
vlan2      301      community
vlan3      302      community
```

show vlan

To display the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) on the switch, use the **show vlan** command in user EXEC mode.

```
show vlan [{brief | dot1q tag native | group | id vlan-id | mtu | name vlan-name | private-vlan
[{type}]} | remote-span | summary}]
```

| Syntax Description | | |
|------------------------------|------------|--|
| brief | (Optional) | Displays one line for each VLAN with the VLAN name, status, and its ports. |
| dot1q tag native | (Optional) | Displays the IEEE 802.1Q native VLAN tagging status. |
| group | (Optional) | Displays information about VLAN groups. |
| id <i>vlan-id</i> | (Optional) | Displays information about a single VLAN identified by the VLAN ID number. For <i>vlan-id</i> , the range is 1 to 4094. |
| mtu | (Optional) | Displays a list of VLANs and the minimum and maximum transmission unit (MTU) sizes configured on ports in the VLAN. |
| name <i>vlan-name</i> | (Optional) | Displays information about a single VLAN identified by the VLAN name. The VLAN name is an ASCII string from 1 to 32 characters. |
| private-vlan | (Optional) | Displays information about configured private VLANs, including primary and secondary VLAN IDs, type (community, isolated, or primary) and ports belonging to the private VLAN. This keyword is only supported if your switch is running the IP services feature set. |
| type | (Optional) | Displays only private VLAN ID and type. |
| remote-span | (Optional) | Displays information about Remote SPAN (RSPAN) VLANs. |
| summary | (Optional) | Displays VLAN summary information. |

Note The **ifindex** keyword is not supported, even though it is visible in the command-line help string.

Command Modes User EXEC

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

In the **show vlan mtu** command output, the `MTU_Mismatch` column shows whether all the ports in the VLAN have the same MTU. When `yes` appears in the column, it means that the VLAN has ports with different MTUs, and packets that are switched from a port with a larger MTU to a port with a smaller MTU might be dropped. If the VLAN does not have an SVI, the hyphen (-) symbol appears in the `SVI_MTU` column. If the `MTU-Mismatch` column displays `yes`, the names of the ports with the `MinMTU` and the `MaxMTU` appear.

If you try to associate a private VLAN secondary VLAN with a primary VLAN before you define the secondary VLAN, the secondary VLAN is not included in the **show vlan private-vlan** command output.

In the **show vlan private-vlan type** command output, a type displayed as `normal` means a VLAN that has a private VLAN association but is not part of the private VLAN. For example, if you define and associate two VLANs as primary and secondary VLANs and then delete the secondary VLAN configuration without removing the association from the primary VLAN, the VLAN that was the secondary VLAN is shown as `normal` in the display. In the **show vlan private-vlan** output, the primary and secondary VLAN pair is shown as `nonoperational`.

Examples

This is an example of output from the **show vlan** command. See the table that follows for descriptions of the fields in the display.

```
Device> show vlan
VLAN Name                               Status      Ports
-----
1      default                               active     Gi1/0/2, Gi1/0/3, Gi1/0/4
                                           Gi1/0/5, Gi1/0/6, Gi1/0/7
                                           Gi1/0/8, Gi1/0/9, Gi1/0/10
                                           Gi1/0/11, Gi1/0/12, Gi1/0/13
                                           Gi1/0/14, Gi1/0/15, Gi1/0/16
                                           Gi1/0/17, Gi1/0/18, Gi1/0/19
                                           Gi1/0/20, Gi1/0/21, Gi1/0/22
                                           Gi1/0/23, Gi1/0/24, Gi1/0/25
                                           Gi1/0/26, Gi1/0/27, Gi1/0/28
                                           Gi1/0/29, Gi1/0/30, Gi1/0/31
                                           Gi1/0/32, Gi1/0/33, Gi1/0/34
                                           Gi1/0/35, Gi1/0/36, Gi1/0/37
                                           Gi1/0/38, Gi1/0/39, Gi1/0/40
                                           Gi1/0/41, Gi1/0/42, Gi1/0/43
                                           Gi1/0/44, Gi1/0/45, Gi1/0/46

Table 224: show vlan Command Output Fields

| Field | Description |
|------------------------------|--|
| VLAN | VLAN number. |
| Name | Name, if configured, of the VLAN. |
| Status | Status of the VLAN (active or suspend). |
| Ports | Ports that belong to the VLAN. |
| Type | Media type of the VLAN. |
| SAID | Security association ID value for the VLAN. |
| MTU | Maximum transmission unit size for the VLAN. |
| Parent | Parent VLAN, if one exists. |
| RingNo | Ring number for the VLAN, if applicable. |
| BrdgNo | Bridge number for the VLAN, if applicable. |
| Stp | Spanning Tree Protocol type used on the VLAN. |
| BrdgMode | Bridging mode for this VLAN—possible values are source-route bridging (SRB) and source-route transparent (SRT); the default is SRB. |
| Trans1 | Translation bridge 1. |
| Trans2 | Translation bridge 2. |
| Remote SPAN VLANs | Identifies any RSPAN VLANs that have been configured. |
| Primary/Secondary/Type/Ports | Includes any private VLANs that have been configured, including the primary VLAN ID, the secondary VLAN ID, the type of secondary VLAN (community or isolated), and the ports that belong to it. |

This is an example of output from the **show vlan dot1q tag native** command:

```
Device> enable
Device> show vlan dot1q tag native
dot1q native vlan tagging is disabled
```

This is an example of output from the **show vlan private-vlan** command:

```
Device> show vlan private-vlan
Primary Secondary Type          Ports
-----

show vtp

To display general information about the VLAN Trunking Protocol (VTP) management domain, status, and counters, use the **show vtp** command in EXEC mode.

show vtp {**counters** | **devices** [**conflicts**] | **interface** [*interface-id*] | **password** | **status**}

| Syntax | Description |
|---------------------|---|
| counters | Displays the VTP statistics for the device. |
| devices | Displays information about all VTP version 3 devices in the domain. This keyword applies only if the device is not running VTP version 3. |
| conflicts | (Optional) Displays information about VTP version 3 devices that have conflicting primary servers. This command is ignored when the device is in VTP transparent or VTP off mode. |
| interface | Displays VTP status and configuration for all interfaces or the specified interface. |
| <i>interface-id</i> | (Optional) Interface for which to display VTP status and configuration. This can be a physical interface or a port channel. |
| password | Displays whether the VTP password is configured or not (available in privileged EXEC mode only). |
| status | Displays general information about the VTP management domain status. |

| Command Modes | Privilege Levels |
|---------------|------------------|
| | User EXEC |
| | Privileged EXEC |

| Command History | Release | Modification |
|-----------------|--------------------------------|---|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| | Cisco IOS XE Gibraltar 16.12.4 | The show vtp password command output now display the password is or is not configured. |

Examples

This is an example of output from the **show vtp devices** command. A **Yes** in the **Conflict** column indicates that the responding server is in conflict with the local server for the feature; that is, when two devices in the same domain do not have the same primary server for a database.

```
Device> enable
Device# show vtp devices
Retrieving information from the VTP domain. Waiting for 5 seconds.
VTP Database Conf Device ID      Primary Server Revision  System Name
-----
VLAN          Yes  00b0.8e50.d000 000c.0412.6300 12354    main.cisco.com
MST           No   00b0.8e50.d000 0004.AB45.6000 24       main.cisco.com
VLAN          Yes  000c.0412.6300=000c.0412.6300 67       qwerty.cisco.com
```

This is an example of output from the **show vtp counters** command. The table that follows describes each field in the display.

```
Device> show vtp counters

Table 225: show vtp counters Field Descriptions

| Field | Description |
|------------------------------------|---|
| Summary advertisements received | Number of summary advertisements received by this device on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow. |
| Subset advertisements received | Number of subset advertisements received by this device on its trunk ports. Subset advertisements contain all the information for one or more VLANs. |
| Request advertisements received | Number of advertisement requests received by this device on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs. |
| Summary advertisements transmitted | Number of summary advertisements sent by this device on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow. |
| Subset advertisements transmitted | Number of subset advertisements sent by this device on its trunk ports. Subset advertisements contain all the information for one or more VLANs. |

| Field | Description |
|---|--|
| Request advertisements transmitted | Number of advertisement requests sent by this device on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs. |
| Number of configuration revision errors | <p>Number of revision errors.</p> <p>Whenever you define a new VLAN, delete an existing one, suspend or resume an existing VLAN, or modify the parameters on an existing VLAN, the configuration revision number of the device increments.</p> <p>Revision errors increment whenever the device receives an advertisement whose revision number matches the revision number of the device, but the MD5 digest values do not match. This error means that the VTP password in the two devices is different or that the devices have different configurations.</p> <p>These errors indicate that the device is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.</p> |
| Number of configuration digest errors | <p>Number of MD5 digest errors.</p> <p>Digest errors increment whenever the MD5 digest in the summary packet and the MD5 digest of the received advertisement calculated by the device do not match. This error usually means that the VTP password in the two devices is different. To solve this problem, make sure the VTP password on all devices is the same.</p> <p>These errors indicate that the device is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.</p> |
| Number of V1 summary errors | <p>Number of Version 1 errors.</p> <p>Version 1 summary errors increment whenever a device in VTP V2 mode receives a VTP Version 1 frame. These errors indicate that at least one neighboring device is either running VTP Version 1 or VTP Version 2 with V2-mode disabled. To solve this problem, change the configuration of the devices in VTP V2-mode to disabled.</p> |
| Join Transmitted | Number of VTP pruning messages sent on the trunk. |

| Field | Description |
|--|--|
| Join Received | Number of VTP pruning messages received on the trunk. |
| Summary Advts Received from non-pruning-capable device | Number of VTP summary messages received on the trunk from devices that do not support pruning. |

This is an example of output from the **show vtp status** command. The table that follows describes each field in the display.

```
Device> show vtp status
VTP Version capable           : 1 to 3
VTP version running          : 1
VTP Domain Name              :
VTP Pruning Mode             : Disabled
VTP Traps Generation         : Disabled
Device ID                    : 2037.06ce.3580
Configuration last modified by 192.168.1.1 at 10-10-12 04:34:02
Local updater ID is 192.168.1.1 on interface LIIN0 (first layer3 interface found
)
```

Feature VLAN:

```
-----
VTP Operating Mode           : Server
Maximum VLANs supported locally : 1005
Number of existing VLANs     : 7
Configuration Revision       : 2
MD5 digest                   : 0xA0 0xA1 0xFE 0x4E 0x7E 0x5D 0x97 0x41
                               0x89 0xB9 0x9B 0x70 0x03 0x61 0xE9 0x27
```

Table 226: show vtp status Field Descriptions

| Field | Description |
|----------------------|---|
| VTP Version capable | Displays the VTP versions that are capable of operating on the device. |
| VTP Version running | Displays the VTP version operating on the device. By default, the device implements Version 1 but can be set to Version 2. |
| VTP Domain Name | Name that identifies the administrative domain for the device. |
| VTP Pruning Mode | Displays whether pruning is enabled or disabled. Enabling pruning on a VTP server enables pruning for the entire management domain. Pruning restricts flooded traffic to those trunk links that the traffic must use to access the appropriate network devices. |
| VTP Traps Generation | Displays whether VTP traps are sent to a network management station. |
| Device ID | Displays the MAC address of the local device. |

| Field | Description |
|---------------------------------|--|
| Configuration last modified | Displays the date and time of the last configuration modification. Displays the IP address of the device that caused the configuration change to the database. |
| VTP Operating Mode | <p>Displays the VTP operating mode, which can be server, client, or transparent.</p> <p>Server—A device in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on it. The device guarantees that it can recover all the VLAN information in the current VTP database from NVRAM after reboot. By default, every device is a VTP server.</p> <p>Note The device automatically changes from VTP server mode to VTP client mode if it detects a failure while writing the configuration to NVRAM and cannot return to server mode until the NVRAM is functioning.</p> <p>Client—A device in VTP client mode is enabled for VTP, can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on it. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.</p> <p>Transparent—A device in VTP transparent mode is disabled for VTP, does not send or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The device receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.</p> |
| Maximum VLANs Supported Locally | Maximum number of VLANs supported locally. |
| Number of Existing VLANs | Number of existing VLANs. |
| Configuration Revision | Current configuration revision number on this device. |
| MD5 Digest | A 16-byte checksum of the VTP configuration. |

switchport mode private-vlan

To configure an interface as either a host private-VLAN port or a promiscuous private-VLAN port, use the **switchport mode private-vlan** command in interface configuration mode. To reset the mode to the appropriate default for the device, use the **no** form of this command.

```
switchport mode private-vlan {host | promiscuous}
no switchport mode private-vlan
```

| | | |
|---------------------------|--|---|
| Syntax Description | host | Configures the interface as a private-VLAN host port. Host ports belong to private-VLAN secondary VLANs and are either community ports or isolated ports, depending on the VLAN to which they belong. |
| | promiscuous | Configures the interface as a private-VLAN promiscuous port. Promiscuous ports are members of private-VLAN primary VLANs. |
| Command Default | None | |
| Command Modes | Interface configuration | |
| Command History | Release | Modification |
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Usage Guidelines | A private-VLAN host or promiscuous port cannot be a Switched Port Analyzer (SPAN) destination port. If you configure a SPAN destination port as a private-VLAN host or promiscuous port, the port becomes inactive. | |
| | <p>Do not configure private VLAN on ports with these other features:</p> <ul style="list-style-type: none"> • Dynamic-access port VLAN membership • Dynamic Trunking Protocol (DTP) • Port Aggregation Protocol (PAgP) • Link Aggregation Control Protocol (LACP) • Multicast VLAN Registration (MVR) • Voice VLAN <p>While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive</p> <p>A private-VLAN port cannot be a secure port and should not be configured as a protected port.</p> <p>For more information about private-VLAN interaction with other features, see the software configuration guide for this release.</p> <p>We strongly recommend that you enable spanning tree Port Fast and bridge-protocol-data-unit (BPDU) guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence.</p> <p>If you configure a port as a private-VLAN host port and you do not configure a valid private-VLAN association by using the switchport private-vlan host-association command, the interface becomes inactive.</p> | |

If you configure a port as a private-VLAN promiscuous port and you do not configure a valid private VLAN mapping by using the **switchport private-vlan mapping** command, the interface becomes inactive.

Examples

This example shows how to configure an interface as a private-VLAN host port and associate it to primary VLAN 20. The interface is a member of secondary isolated VLAN 501 and primary VLAN 20.

```
(config)# interface gigabitethernet2/0/1
(config-if)# switchport mode private-vlan host
(config-if)# switchport private-vlan host-association 20 501
(config-if)# end
```

This example shows how to configure an interface as a private-VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
(config)# interface gigabitethernet2/0/1
(config-if)# switchport mode private-vlan promiscuous
(config-if)# switchport private-vlan mapping 20 501-503
(config-if)# end
```

switchport priority extend

To set a port priority for the incoming untagged frames or the priority of frames received by the IP phone connected to the specified port, use the **switchport priority extend** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

```
switchport priority extend {cos value | trust}
no switchport priority extend
```

| Syntax Description | cos value | trust |
|--------------------|--|---|
| | Sets the IP phone port to override the IEEE 802.1p priority received from the PC or the attached device with the specified class of service (CoS) value. The range is 0 to 7. Seven is the highest priority. The default is 0. | Sets the IP phone port to trust the IEEE 802.1p priority received from the PC or the attached device. |

Command Default The default port priority is set to a CoS value of 0 for untagged frames received on the port.

Command Modes Interface configuration

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines When voice VLAN is enabled, you can configure the device to send the Cisco Discovery Protocol (CDP) packets to instruct the IP phone how to send data packets from the device attached to the access port on the Cisco IP Phone. You must enable CDP on the device port connected to the Cisco IP Phone to send the configuration to the Cisco IP Phone. (CDP is enabled by default globally and on all device interfaces.)

You should configure voice VLAN on the device access ports.

This example shows how to configure the IP phone connected to the specified port to trust the received IEEE 802.1p priority:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport priority extend trust
```

You can verify your settings by entering the **show interfaces interface-id switchport** privileged EXEC command.

switchport trunk

To set the trunk characteristics when the interface is in trunking mode, use the **switchport trunk** command in interface configuration mode. To reset a trunking characteristic to the default, use the **no** form of this command.

```
switchport trunk {allowed vlan vlan-list | native vlan vlan-id | pruning vlan vlan-list}
no switchport trunk {allowed vlan | native vlan | pruning vlan}
```

Syntax Description

| | |
|--------------------------------------|---|
| allowed vlan <i>vlan-list</i> | Sets the list of allowed VLANs that can receive and send traffic on this interface in tagged format when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices. |
| native vlan <i>vlan-id</i> | Sets the native VLAN for sending and receiving untagged traffic when the interface is in IEEE 802.1Q trunking mode. The range is 1 to 4094. |
| pruning vlan <i>vlan-list</i> | Sets the list of VLANs that are eligible for VTP pruning when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices. |

Command Default

VLAN 1 is the default native VLAN ID on the port.
The default for all VLAN lists is to include all VLANs.

Command Modes

Interface configuration

Command History

| Release | Modification |
|-----------------------------|------------------------------|
| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

The *vlan-list* format is **all** | **none** | [**add** | **remove** | **except**] *vlan-atom* [,*vlan-atom*...]:

- **all** specifies all VLANs from 1 to 4094. This is the default. This keyword is not allowed on commands that do not permit all VLANs in the list to be set at the same time.
- **none** specifies an empty list. This keyword is not allowed on commands that require certain VLANs to be set or at least one VLAN to be set.
- **add** adds the defined list of VLANs to those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLANs (VLAN IDs greater than 1005) are valid in some cases.

Note You can add extended-range VLANs to the allowed VLAN list, but not to the pruning-eligible VLAN list.

Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.

- **remove** removes the defined list of VLANs from those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLAN IDs are valid in some cases.

Note You can remove extended-range VLANs from the allowed VLAN list, but you cannot remove them from the pruning-eligible list.

- **except** lists the VLANs that should be calculated by inverting the defined list of VLANs. (VLANs are added except the ones specified.) Valid IDs are from 1 to 1005. Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.
- *vlan-atom* is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.

Native VLANs:

- All untagged traffic received on an IEEE 802.1Q trunk port is forwarded with the native VLAN configured for the port.
- If a packet has a VLAN ID that is the same as the sending-port native VLAN ID, the packet is sent without a tag; otherwise, the switch sends the packet with a tag.
- The **no** form of the **native vlan** command resets the native mode VLAN to the appropriate default VLAN for the device.

Allowed VLAN:

- To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), Dynamic Trunking Protocol (DTP), and VLAN Trunking Protocol (VTP) in VLAN 1.
- The **no** form of the **allowed vlan** command resets the list to the default list, which allows all VLANs.

Trunk pruning:

- The pruning-eligible list applies only to trunk ports.
- Each trunk port has its own eligibility list.
- If you do not want a VLAN to be pruned, remove it from the pruning-eligible list. VLANs that are pruning-ineligible receive flooded traffic.
- VLAN 1, VLANs 1002 to 1005, and extended-range VLANs (VLANs 1006 to 4094) cannot be pruned.

Examples

This example shows how to configure VLAN 3 as the default for the port to send all untagged traffic:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk native vlan 3
```

This example shows how to add VLANs 1, 2, 5, and 6 to the allowed list:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk allowed vlan add 1,2,5,6
```

This example shows how to remove VLANs 3 and 10 to 15 from the pruning-eligible list:

```
Device> enable
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk pruning vlan remove 3,10-15
```

You can verify your settings by entering the **show interfaces *interface-id* switchport** privileged EXEC command.

vlan

To add a VLAN and to enter the VLAN configuration mode, use the **vlan** command in global configuration mode. To delete the VLAN, use the **no** form of this command.

vlan *vlan-id*
no vlan *vlan-id*

| Syntax Description | <i>vlan-id</i> ID of the VLAN to be added and configured. The range is 1 to 4094. You can enter a single VLAN ID, a series of VLAN IDs separated by commas, or a range of VLAN IDs separated by hyphens. | | | | |
|-----------------------------|--|---------|--------------|-----------------------------|------------------------------|
| Command Default | None | | | | |
| Command Modes | Global configuration | | | | |
| Command History | <table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>Cisco IOS XE Everest 16.6.1</td> <td>This command was introduced.</td> </tr> </tbody> </table> | Release | Modification | Cisco IOS XE Everest 16.6.1 | This command was introduced. |
| Release | Modification | | | | |
| Cisco IOS XE Everest 16.6.1 | This command was introduced. | | | | |

Usage Guidelines You can use the **vlan** *vlan-id* global configuration command to add normal-range VLANs (VLAN IDs 1 to 1005) or extended-range VLANs (VLAN IDs 1006 to 4094). Configuration information for normal-range VLANs is always saved in the VLAN database, and you can display this information by entering the **show vlan** privileged EXEC command. If the VTP mode is transparent, VLAN configuration information for normal-range VLANs is also saved in the running configuration file. VLAN IDs in the extended range are not saved in the VLAN database, but they are stored in the switch running configuration file, and you can save the configuration in the startup configuration file.

VTP version 3 supports propagation of extended-range VLANs. VTP versions 1 and 2 propagate only VLANs 1 to 1005.

When you save the VLAN and VTP configurations in the startup configuration file and reboot the , the configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

If you enter an invalid VLAN ID, you receive an error message and do not enter VLAN configuration mode.

Entering the **vlan** command with a VLAN ID enables VLAN configuration mode. When you enter the VLAN ID of an existing VLAN, you do not create a new VLAN, but you can modify VLAN parameters for that VLAN. The specified VLANs are added or modified when you exit the VLAN configuration mode. Only the **shutdown** command (for VLANs 1 to 1005) takes effect immediately.

Note Although all commands are visible, the only VLAN configuration command that is supported on extended-range VLANs is **remote-span**. For extended-range VLANs, all other characteristics must remain at the default state.

These configuration commands are available in VLAN configuration mode. The **no** form of each command returns the characteristic to its default state:

- **are** *are-number*—Defines the maximum number of all-routes explorer (ARE) hops for this VLAN. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7. If no value is entered, 0 is assumed to be the maximum.
- **backupcrf**—Specifies the backup CRF mode. This keyword applies only to TrCRF VLANs.
 - **enable**—Backup CRF mode for this VLAN.
 - **disable**—Backup CRF mode for this VLAN (the default).
- **bridge** {*bridge-number* | **type**}—Specifies the logical distributed source-routing bridge, the bridge that interconnects all logical rings that have this VLAN as a parent VLAN in FDDI-NET, Token Ring-NET, and TrBRF VLANs. The range is 0 to 15. The default bridge number is 0 (no source-routing bridge) for FDDI-NET, TrBRF, and Token Ring-NET VLANs. The **type** keyword applies only to TrCRF VLANs and is one of these:
 - **srb**—Source-route bridging
 - **srt**—Source-route transparent) bridging VLAN
- **exit**—Applies changes, increments the VLAN database revision number (VLANs 1 to 1005 only), and exits VLAN configuration mode.
- **media**—Defines the VLAN media type and is one of these:

Note The supports only Ethernet ports. You configure only FDDI and Token Ring media-specific characteristics for VLAN Trunking Protocol (VTP) global advertisements to other . These VLANs are locally suspended.

- **ethernet**—Ethernet media type (the default).
- **fd-net**—FDDI network entity title (NET) media type.
- **fddi**—FDDI media type.
- **tokenring**—Token Ring media type if the VTP v2 mode is disabled, or TrCRF if the VTP Version 2 (v) mode is enabled.
- **tr-net**—Token Ring network entity title (NET) media type if the VTP v2 mode is disabled or TrBRF media type if the VTP v2 mode is enabled.

See the table that follows for valid commands and syntax for different media types.

- **name** *vlan-name*—Names the VLAN with an ASCII string from 1 to 32 characters that must be unique within the administrative domain. The default is VLANxxxx where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number.

- **no**—Negates a command or returns it to the default setting.
- **parent** *parent-vlan-id*—Specifies the parent VLAN of an existing FDDI, Token Ring, or TrCRF VLAN. This parameter identifies the TrBRF to which a TrCRF belongs and is required when defining a TrCRF. The range is 0 to 1005. The default parent VLAN ID is 0 (no parent VLAN) for FDDI and Token Ring VLANs. For both Token Ring and TrCRF VLANs, the parent VLAN ID must already exist in the database and be associated with a Token Ring-NET or TrBRF VLAN.
- **remote-span**—Configures the VLAN as a Remote SPAN (RSPAN) VLAN. When the RSPAN feature is added to an existing VLAN, the VLAN is first deleted and is then recreated with the RSPAN feature. Any access ports are deactivated until the RSPAN feature is removed. If VTP is enabled, the new RSPAN VLAN is propagated by VTP for VLAN IDs that are lower than 1024. Learning is disabled on the VLAN.
- **ring** *ring-number*—Defines the logical ring for an FDDI, Token Ring, or TrCRF VLAN. The range is 1 to 4095. The default for Token Ring VLANs is 0. For FDDI VLANs, there is no default.
- **said** *said-value*—Specifies the security association identifier (SAID) as documented in IEEE 802.10. The range is 1 to 4294967294, and the number must be unique within the administrative domain. The default value is 100000 plus the VLAN ID number.
- **shutdown**—Shuts down VLAN switching on the VLAN. This command takes effect immediately. Other commands take effect when you exit VLAN configuration mode.
- **state**—Specifies the VLAN state:
 - **active** means the VLAN is operational (the default).
 - **suspend** means the VLAN is suspended. Suspended VLANs do not pass packets.
- **ste** *ste-number*—Defines the maximum number of spanning-tree explorer (STE) hops. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7.
- **stp type**—Defines the spanning-tree type for FDDI-NET, Token Ring-NET, or TrBRF VLANs. For FDDI-NET VLANs, the default STP type is *ieee*. For Token Ring-NET VLANs, the default STP type is *ibm*. For FDDI and Token Ring VLANs, the default is no type specified.
 - **ieee**—IEEE Ethernet STP running source-route transparent (SRT) bridging.
 - **ibm**—IBM STP running source-route bridging (SRB).
 - **auto**—STP running a combination of source-route transparent bridging (IEEE) and source-route bridging (IBM).
- **tb-vlan1** *tb-vlan1-id* and **tb-vlan2** *tb-vlan2-id*—Specifies the first and second VLAN to which this VLAN is translationally bridged. Translational VLANs translate FDDI or Token Ring to Ethernet, for example. The range is 0 to 1005. If no value is specified, 0 (no transitional bridging) is assumed.

Table 227: Valid Commands and Syntax for Different Media Types

| Media Type | Valid Syntax |
|------------|--|
| Ethernet | name <i>vlan-name</i> , media ethernet , state { suspend active }, said <i>said-value</i> , remote-span , tb-vlan1 <i>tb-vlan1-id</i> , tb-vlan2 <i>tb-vlan2-id</i> |

| Media Type | Valid Syntax |
|--|--|
| FDDI | name <i>vlan-name</i> , media fddi , state {suspend active}, said <i>said-value</i> , ring <i>ring-number</i> , parent <i>parent-vlan-id</i> , tb-vlan1 <i>tb-vlan1-id</i> , tb-vlan2 <i>tb-vlan2-id</i> |
| FDDI-NET | name <i>vlan-name</i> , media fd-net , state {suspend active}, said <i>said-value</i> , bridge <i>bridge-number</i> , stp type {ieec ibm auto}, tb-vlan1 <i>tb-vlan1-id</i> , tb-vlan2 <i>tb-vlan2-id</i> If VTP v2 mode is disabled, do not set the stp type to auto . |
| Token Ring | VTP v1 mode is enabled. name <i>vlan-name</i> , media tokenring , state {suspend active}, said <i>said-value</i> , ring <i>ring-number</i> , parent <i>parent-vlan-id</i> , tb-vlan1 <i>tb-vlan1-id</i> , tb-vlan2 <i>tb-vlan2-id</i> |
| Token Ring concentrator relay function (TrCRF) | VTP v2 mode is enabled. name <i>vlan-name</i> , media tokenring , state {suspend active}, said <i>said-value</i> , ring <i>ring-number</i> , parent <i>parent-vlan-id</i> , bridge type {srb srt}, are <i>are-number</i> , ste <i>ste-number</i> , backupcrf {enable disable}, tb-vlan1 <i>tb-vlan1-id</i> , tb-vlan2 <i>tb-vlan2-id</i> |
| Token Ring-NET | VTP v1 mode is enabled. name <i>vlan-name</i> , media tr-net , state {suspend active}, said <i>said-value</i> , bridge <i>bridge-number</i> , stp type {ieec ibm}, tb-vlan1 <i>tb-vlan1-id</i> , tb-vlan2 <i>tb-vlan2-id</i> |
| Token Ring bridge relay function (TrBRF) | VTP v2 mode is enabled. name <i>vlan-name</i> , media tr-net , state {suspend active}, said <i>said-value</i> , bridge <i>bridge-number</i> , stp type {ieec ibm auto}, tb-vlan1 <i>tb-vlan1-id</i> , tb-vlan2 <i>tb-vlan2-id</i> |

The following table describes the rules for configuring VLANs:

Table 228: VLAN Configuration Rules

| Configuration | Rule |
|--|--|
| VTP v2 mode is enabled, and you are configuring a TrCRF VLAN media type. | Specify a parent VLAN ID of a TrBRF that already exists in the database. Specify a ring number. Do not leave this field blank. Specify unique ring numbers when TrCRF VLANs have the same parent VLAN ID. Only one backup concentrator relay function (CRF) can be enabled. |
| VTP v2 mode is enabled, and you are configuring VLANs other than TrCRF media type. | Do not specify a backup CRF. |
| VTP v2 mode is enabled, and you are configuring a TrBRF VLAN media type. | Specify a bridge number. Do not leave this field blank. |
| VTP v1 mode is enabled. | No VLAN can have an STP type set to auto. This rule applies to Ethernet, FDDI, FDDI-NET, Token Ring, and Token Ring-NET VLANs. |
| Add a VLAN that requires translational bridging (values are not set to zero). | The translational bridging VLAN IDs that are used must already exist in the database. The translational bridging VLAN IDs that a configuration points to must also contain a pointer to the original VLAN in one of the translational bridging parameters (for example, Ethernet points to FDDI, and FDDI points to Ethernet). The translational bridging VLAN IDs that a configuration points to must be different media types than the original VLAN (for example, Ethernet can point to Token Ring). If both translational bridging VLAN IDs are configured, these VLANs must be different media types (for example, Ethernet can point to FDDI and Token Ring). |

Examples

This example shows how to add an Ethernet VLAN with default media characteristics. The default includes a *vlan-name* of VLAN *xxxx*, where *xxxx* represents four numeric digits (including leading zeros) equal to the VLAN ID number. The default media is ethernet; the state is active. The default said-value is 100000 plus the VLAN ID; the mtu-size variable is 1500; the stp-type is ieee. When you enter the **exit** VLAN configuration command, the VLAN is added if it did not already exist; otherwise, this command does nothing.

This example shows how to create a new VLAN with all default characteristics and enter VLAN configuration mode:

```
(config)# vlan 200
(config-vlan)# exit
```

```
(config)#
```

This example shows how to create a new extended-range VLAN with all the default characteristics, to enter VLAN configuration mode, and to save the new VLAN in the startup configuration file:

```
(config)# vlan 2000  
(config-vlan)# end  
# copy running-config startup config
```

You can verify your setting by entering the **show vlan** privileged EXEC command.

vlan dot1q tag native

To enable tagging of native VLAN frames on all IEEE 802.1Q trunk ports, use the **vlan dot1q tag native** command in global configuration mode. To return to the default setting, use the **no** form of this command.

```
vlan dot1q tag native
no vlan dot1q tag native
```

Syntax Description This command has no arguments or keywords.

Command Default The IEEE 802.1Q native VLAN tagging is disabled.

Command Modes Global configuration

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines When enabled, native VLAN packets going out of all IEEE 802.1Q trunk ports are tagged.
When disabled, native VLAN packets going out of all IEEE 802.1Q trunk ports are not tagged.
For more information about IEEE 802.1Q tunneling, see the software configuration guide for this release.

Examples This example shows how to enable IEEE 802.1Q tagging on native VLAN frames:

```
Device# configure terminal
Device (config)# vlan dot1q tag native
Device (config)# end
```

You can verify your settings by entering the **show vlan dot1q tag native** privileged EXEC command.

vtp (global configuration)

To set or modify the VLAN Trunking Protocol (VTP) configuration characteristics, use the **vtp** command in global configuration mode. To remove the settings or to return to the default settings, use the **no** form of this command.

vtp {**domain** *domain-name* | **file** *filename* | **interface** *interface-name* [**only**] | **mode** {**client** | **off** | **server** | **transparent**} [{**mst** | **unknown** | **vlan**}] | **password** *password* [{**hidden** | **secret**}] | **pruning** | **version** *number*}

no vtp {**file** | **interface** | **mode** [{**client** | **off** | **server** | **transparent**}] [{**mst** | **unknown** | **vlan**}] | **password** | **pruning** | **version**}

Syntax Description

| | |
|---|--|
| domain <i>domain-name</i> | Specifies the VTP domain name, an ASCII string from 1 to 32 characters that identifies the VTP administrative domain for the device. The domain name is case sensitive. |
| file <i>filename</i> | Specifies the Cisco IOS file system file where the VTP VLAN configuration is stored. |
| interface <i>interface-name</i> | Specifies the name of the interface providing the VTP ID updated for this device. |
| only | (Optional) Uses only the IP address of this interface as the VTP IP updater. |
| mode | Specifies the VTP device mode as client, server, or transparent. |
| client | Places the device in VTP client mode. A device in VTP client mode is enabled for VTP, and can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database. |
| off | Places the device in VTP off mode. A device in VTP off mode functions the same as a VTP transparent device except that it does not forward VTP advertisements on trunk ports. |
| server | Places the device in VTP server mode. A device in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on the device. The device can recover all the VLAN information in the current VTP database from nonvolatile storage after reboot. |
| transparent | Places the device in VTP transparent mode. A device in VTP transparent mode is disabled for VTP, does not send advertisements or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The device receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received. When VTP mode is transparent, the mode and domain name are saved in the device running configuration file, and you can save them in the device startup configuration file by entering the copy running-config startup config privileged EXEC command. |
| mst | (Optional) Sets the mode for the multiple spanning tree (MST) VTP database (only VTP Version 3). |

| | |
|------------------------------------|--|
| unknown | (Optional) Sets the mode for unknown VTP databases (only VTP Version 3). |
| vlan | (Optional) Sets the mode for VLAN VTP databases. This is the default (only VTP Version 3). |
| password <i>password</i> | Sets the administrative domain password for the generation of the 16-byte secret value used in MD5 digest calculation to be sent in VTP advertisements and to validate received VTP advertisements. The password can be an ASCII string from 1 to 32 characters. The password is case sensitive. |
| hidden | (Optional) Specifies that the key generated from the password string is saved in the VLAN database file. When the hidden password is entered, you need to reenter the password to issue a command in the domain. This keyword is supported only in VTP Version 3. |
| secret | (Optional) Allows the user to directly configure the password secret key (only VTP Version 3). |
| pruning | Enables VTP pruning on the device. |
| version <i>number</i> | Sets the VTP Version to Version 1, Version 2, or Version 3. |

Command Default

The default filename is *flash:vlan.dat*.

The default mode is server mode and the default database is VLAN.

In VTP Version 3, for the MST database, the default mode is transparent.

No domain name or password is defined.

No password is configured.

Pruning is disabled.

The default version is Version 1.

Command Modes

Global configuration

Command History

| Release | Modification |

| Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines

When you save VTP mode, domain name, and VLAN configurations in the device startup configuration file and reboot the device, the VTP and VLAN configurations are selected by these conditions:

- If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

The **vtp file** *filename* cannot be used to load a new database; it renames only the file in which the existing database is stored.

Follow these guidelines when configuring a VTP domain name:

- The device is in the no-management-domain state until you configure a domain name. While in the no-management-domain state, the device does not send any VTP advertisements even if changes occur to the local VLAN configuration. The device leaves the no-management-domain state after it receives the first VTP summary packet on any port that is trunking or after you configure a domain name by using the **vtp domain** command. If the device receives its domain from a summary packet, it resets its configuration revision number to 0. After the device leaves the no-management-domain state, it cannot be configured to reenter it until you clear the NVRAM and reload the software.
- Domain names are case-sensitive.
- After you configure a domain name, it cannot be removed. You can only reassign it to a different domain.

Follow these guidelines when setting VTP mode:

- The **no vtp mode** command returns the device to VTP server mode.
- The **vtp mode server** command is the same as **no vtp mode** except that it does not return an error if the device is not in client or transparent mode.
- If the receiving device is in client mode, the client device changes its configuration to duplicate the configuration of the server. If you have devices in client mode, be sure to make all VTP or VLAN configuration changes on a device in server mode, as it has a higher VTP configuration revision number. If the receiving device is in transparent mode, the device configuration is not changed.
- A device in transparent mode does not participate in VTP. If you make VTP or VLAN configuration changes on a device in transparent mode, the changes are not propagated to other devices in the network.
- If you change the VTP or VLAN configuration on a device that is in server mode, that change is propagated to all the devices in the same VTP domain.
- The **vtp mode transparent** command disables VTP from the domain but does not remove the domain from the device.
- In VTP Versions 1 and 2, the VTP mode must be transparent for VTP and VLAN information to be saved in the running configuration file.
- With VTP Versions 1 and 2, you cannot change the VTP mode to client or server if extended-range VLANs are configured on the switch. Changing the VTP mode is allowed with extended VLANs in VTP Version 3.
- The VTP mode must be transparent for you to add extended-range VLANs or for VTP and VLAN information to be saved in the running configuration file.
- VTP can be set to either server or client mode only when dynamic VLAN creation is disabled.
- The **vtp mode off** command sets the device to off. The **no vtp mode off** command resets the device to the VTP server mode.

Follow these guidelines when setting a VTP password:

- Passwords are case sensitive. Passwords should match on all devices in the same domain.
- When you use the **no vtp password** form of the command, the device returns to the no-password state.

- The **hidden** and **secret** keywords are supported only in VTP Version 3. If you convert from VTP Version 2 to VTP Version 3, you must remove the hidden or secret keyword before the conversion.

Follow these guidelines when setting VTP pruning:

- VTP pruning removes information about each pruning-eligible VLAN from VTP updates if there are no stations belonging to that VLAN.
- If you enable pruning on the VTP server, it is enabled for the entire management domain for VLAN IDs 1 to 1005.
- Only VLANs in the pruning-eligible list can be pruned.
- Pruning is supported with VTP Version 1 and Version 2.

Follow these guidelines when setting the VTP version:

- Toggling the Version 2 (v2) mode state modifies parameters of certain default VLANs.
- Each VTP device automatically detects the capabilities of all the other VTP devices. To use Version 2, all VTP devices in the network must support Version 2; otherwise, you must configure them to operate in VTP Version 1 mode.
- If all devices in a domain are VTP Version 2-capable, you only need to configure Version 2 on one device; the version number is then propagated to the other Version-2 capable devices in the VTP domain.
- If you are using VTP in a Token Ring environment, VTP Version 2 must be enabled.
- If you are configuring a Token Ring bridge relay function (TrBRF) or Token Ring concentrator relay function (TrCRF) VLAN media type, you must use Version 2.
- If you are configuring a Token Ring or Token Ring-NET VLAN media type, you must use Version 1.
- In VTP Version 3, all database VTP information is propagated across the VTP domain, not only VLAN database information.
- Two VTP Version 3 regions can only communicate over a VTP Version 1 or VTP Version 2 region in transparent mode.

You cannot save password, pruning, and version configurations in the device configuration file.

Examples

This example shows how to rename the filename for VTP configuration storage to vtpfilename:

```
Device(config)# vtp file vtpfilename
```

This example shows how to clear the device storage filename:

```
Device(config)# no vtp file vtpconfig  
Clearing device storage filename.
```

This example shows how to specify the name of the interface providing the VTP updater ID for this device:

```
Device(config)# vtp interface gigabitethernet
```

This example shows how to set the administrative domain for the device:

```
Device(config)# vtp domain OurDomainName
```

This example shows how to place the device in VTP transparent mode:

```
Device(config)# vtp mode transparent
```

This example shows how to configure the VTP domain password:

```
Device(config)# vtp password ThisIsOurDomainsPassword
```

This example shows how to enable pruning in the VLAN database:

```
Device(config)# vtp pruning  
Pruning switched ON
```

This example shows how to enable Version 2 mode in the VLAN database:

```
Device(config)# vtp version 2
```

You can verify your settings by entering the **show vtp status** privileged EXEC command.

vtp (interface configuration)

To enable the VLAN Trunking Protocol (VTP) on a per-port basis, use the **vtp** command in interface configuration mode. To disable VTP on the interface, use the **no** form of this command.

vtp
no vtp

Syntax Description This command has no arguments or keywords.

Command Modes Interface configuration

| Command History | Release | Modification |
|------------------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines Enter this command only on interfaces that are in trunking mode.

Examples

This example shows how to enable VTP on an interface:

```
Device> enable
Device(config-if)# vtp
```

This example shows how to disable VTP on an interface:

```
Device(config-if)# no vtp
```

vtp primary

To configure a device as the VLAN Trunking Protocol (VTP) primary server, use the **vtp primary** command in privileged EXEC mode.

vtp primary [{mst | vlan}] [force]

| Syntax Description | |
|--------------------|--|
| mst | (Optional) Configures the device as the primary VTP server for the multiple spanning tree (MST) feature. |
| vlan | (Optional) Configures the device as the primary VTP server for VLANs. |
| force | (Optional) Configures the device to not check for conflicting devices when configuring the primary server. |

Command Default The device is a VTP secondary server.

Command Modes Privileged EXEC

| Command History | Release | Modification |
|-----------------|-----------------------------|------------------------------|
| | Cisco IOS XE Everest 16.6.1 | This command was introduced. |

Usage Guidelines A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to NVRAM.

By default, all devices come up as secondary servers. Primary server status is needed only for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers.

Primary server status is lost if the device reloads or domain parameters change.

Note This command is supported only when the device is running VTP Version 3.

Examples

This example shows how to configure the device as the primary VTP server for VLANs:

```
Device> enable
Device# vtp primary vlan
Setting device to VTP TRANSPARENT mode.
```

You can verify your settings by entering the **show vtp status** privileged EXEC command.
